Flammability:	Non-Combustible
Log Kow:	-6.19 Estimated Value
Viscosity:	No data available
Vapor Pressure:	No data available
Vapor Density:	No data available
Solubility Water:	212.5 g/l; 20°C / 68°F
Relative Density:	2.52 – 2.53; 20°C / 68°F
Absolute Density:	2,530 kg/m^3
Decomposition Temperature:	>1600°C / >2912°F
Auto-Ignition Temperature:	>400°C / >752°F
Explosive Properties:	No data available
Oxidizing Properties:	No data available

9.2 PHYSICAL HAZARDS
No data available.

10 STABILITY AND REACTIVITY

10.1 REACTIVITY
None under normal use conditions.

10.2 CHEMICAL STABILITY
Stable. Decomposes by reaction with strong acid.

10.3 POSSIBILITY OF HAZARDOUS REACTIONS
None under normal processing.

10.4 CONDITIONS TO AVOID
Exposure to air or moisture over prolonged periods.

10.5 INCOMPATIBLE MATERIALS
Aluminum, powdered aluminum, and acids.

10.6 HAZARDOUS POLYMERIZATION
Hazardous polymerization does not occur.

11 TOXICOLOGICAL INFORMATION

11.1 INFORMATION ON TOXICOLOGICAL EFFECTS

11.1.1 Acute toxicity
LD50 Oral - rat – 2,800 mg/kg
LD50 Dermal - rabbit >2,000 mg/kg
LD50 Inhalation - rat – 2.30 mg/l, 2-hour exposure time

11.1.2 Corrosion/irritation
Skin - rabbit
Result: Mild skin irritation – 24 hours

11.1.3 Serious eye damage/eye irritation
Eyes - rabbit
Result: Severe eye irritation – 24 hours

11.1.4 Respiratory or skin sensitization
Inhalation - no data available
Skin Sensitization: no data available

11.1.5 Germ cell mutagenicity
No data available

11.1.6 Carcinogenicity
No data available

11.1.7 Reproductive toxicity
No data available

11.1.8 Specific target organ toxicity - single exposure
No data available

11.1.9 Specific target organ toxicity - repeated exposure
No data available

11.1.10 Chronic effects from short and long-term exposure
On continuous / repeated exposure / contact: Red skin. Dry skin. Tingling / irritation of the skin. Affection of the nasal septum.

12 ECOLOGOCAL INFORMATION

12.1 TOXICITY

	Parameter	Method	Value	Duration	Species	Test Design	Fresh/Salt Water	Value Determination
Acute toxicity fishes	LC50 Other	Other	300 mg/l	96 h	Lepomis macronhirus	Static system	Fresh water	Experimental value
Acute toxicity invertebrates	EC50	Other	200-227 mg/l	48 h	Ceriodaphnia sp.	Semi-static	Fresh water	Experimental value
Toxicity algae and other aquatic plants	EC50		242 mg/l	5 days	Algae			Experimental value

12.2 PERSISTENCE AND DEGRADABILITY:
Biodegradability: not applicable

12.3 BIOACCUMULATIVE POTENTIAL:
Low potential for bioaccumulation (Log Kow <4)

12.4 MOBILITY IN SOIL:
Low potential for absorption in soil.

12.5 RESULTS OF PBT AND VPVB ASSESSMENT:
PBT/vPvB assessment not available as chemical safety assessment is not required/not conducted.

12.6 OTHER ADVERSE EFFECTS:
No data available.

13 DISPOSAL CONSIDERATIONS

13.1 WASTE DISPOSAL
Remove waste in accordance with local and/or national regulations. Contact a licensed professional waste disposal service to dispose of this material. Different types of hazardous waste should not be mixed together if it will entail a risk of pollution or create problems for the further management of the waste. Hazardous waste shall be managed responsibly. Do not discharge into drains.

14 TRANSPORT INFORMATION

14.1 UNITED STATES DEPARTMENT OF TRANSPORTATION (DOT)
Non-regulated

14.2 INTERNATIONAL MARITIME DANGEROUS GOODS (IMDG)
Non-regulated

14.3 INTERNATIONAL AIR TRANSPORT ASSOCIATION (IATA)
Non-regulated

14.4 TDG/ADN/RID/ADR
Non-regulated

15 REGULATORY INFORMATION

15.1 SARA 302 COMPONENTS
SARA 302: No chemicals in this material are subject to the reporting requirements of SARA Title III, Section 302.

15.2 SARA 313 COMPONENTS
SARA 313: This material does not contain any chemical with known CAS numbers that exceed the threshold (De Minimis) reporting levels established by SARA Title III, Section 313.

15.3 SARA 311/312 HAZARDS
Acute Health Hazard

15.4 PENNSYLVANIA RIGHT TO KNOW COMPONENTS
Sodium carbonate, CAS-No: 497-19-8

15.5 NEW JERSEY RIGHT TO KNOW COMPONENTS
Sodium carbonate, CAS-No: 497-19-8

15.6 WHMIS CLASSIFICATION: C, D2
Note: The product listed on this SDS has been classified in accordance with the hazard criteria of the Canadian Controlled Products Regulations.

15.7 US CALIFORNIA SAFE DRINKING WATER & TOXIC ENFORCEMENT ACT (PROPOSITION 65)
This product does not contain any chemicals known to the State of California to cause cancer, birth, or any other reproductive defects.

16 OTHER INFORMATION

16.1 FULL TEXT OF H-STATEMENTS REFERRED TO UNDER SECTION 2 AND 3.

Eye Irrit.	Eye Irritation
H319	Causes serious eye irritation

16.2 HMIS RATING

Health Hazard:	2
Flammability:	0
Physical Hazard:	0

16.3 NFPA RATING

Health Hazard:	2
Fire Hazard:	0
Reactivity Hazard:	0

16.4 NOTICE

The above information is believed to be correct but is not intended to be all inclusive and shall be used only as a guide. The information in this document is based on the present state of our knowledge and is applicable to the product with regard to appropriate safety precautions. It does not represent any guarantee of the properties of the product. Ciner and its Affiliates shall not be held liable for any damage resulting from handling or from contact with the above product.

16.5 PRODUCT CERTIFICATIONS

This product is certified to NSF/ANSI Standard 60 for use in drinking water treatment at the specified maximum use limit. The MUL (maximum use level) for sodium carbonate anhydrous is 100 mg/L under NSF/ANSI Standard 60.

Safety Data Sheet

CITRIC ACID FCC/USP PWD

SECTION 1:IDENTIFICATION OF THE SUBSTANCE/ MIXTURE AND OF THE COMPANY/UNDERTAKING

1.1 PRODUCT IDENTIFIER

- Chemical name	Citric acid - Food grade
- REACH Registration Number	01-2119457026-42-0031

1.2 RELEVANT IDENTIFIED USES OF THE SUBSTANCE AND USES ADVISED AGAINST

Citric acid can be used in food as food additives and also in technical application as clarifying agent, water softener, buffer, foam booster and stabilizer, complexing agent and as an intermediate in production of organic chemicals.

1.3 DETAILS OF THE SUPPLIER

- Company identification

US:
Tate & Lyle Ingredients Americas, LLC.
2200 E.Eldorado Street
Decatur, IL 62521

Europe:
Tate & Lyle Slovakia s.r.o.
Boleraz 114
919 08 boleraz

CHEMTREC
Toll-Free: 1-800-424-9300 (USA and Canada)
Non Toll-Free +1-703-527-3887 (Global)

SECTION 2:HAZARDS IDENTIFICATION

2.1. CLASSIFICATION OF THE SUBSTANCE OR MIXTURE

According with the version of the Globally Harmonized system of Classification and labeling adopted in the United states and Regulation 1272/2008/EC [CLP]: Eyes irritant category 2(H319)

Safety Data Sheet

CITRIC ACID FCC/USP PWD

2.2 LABEL ELEMENTS

GHS07

Signal word:
Warning

Hazard Statement:
Causes serious eye irritation. H319

Precautionary Statement:
Wash hands thoroughly after handling. P264
Wear eye protection. P280

Precautionary Statement. IF IN EYES: P305
Response :
Rinse cautiously with water for several minutes. P351
Remove contact lenses, if present and easy to do Continue rinsing. P338
If eye irritation persists: P337
Get medical advice/attention. P313

2.3. OTHER HAZARDS
FIRE AND EXPLOSION HAZARD:
May form combustible dust concentrations in air. Possibility of dust explosion. it is recommended that all dust control equipment and material transport systems involved are engineered to prevent conditions contributing to dust explosions. Do not allow dust to accumulate on flat surfaces, on rafters or building structural components. Keep away from all ignition sources including heat, sparks and flame.

SECTION 3:COMPOSITION/INFORMATION OF INGREDIENTS

- Chemical name Citric acid - Food grade

Safety Data Sheet

CITRIC ACID FCC/USP PWD

- CAS number	77-92-9
- EINECS number	201-069-1
- Synonyms	2 - Hydroxy -1,2,3 propanetricarboxylic acid Acidulant - Citric acid - food additive E330.

SECTION 4:FIRST AID MEASURES

4.1 DESCRIPTION OF FIRST AID MEASURES

- General advise	Seek medical attention if irritation develops after first aid application
- Inhalation	Move people from the exposure to fresh air.
- Skin contact	Wash skin with soap and water.
- Eye contact	Remove particulates by irrigating with eye wash solution or clean water, holding eyelids apart.
- Ingestion	Wash mouth and flush throat upto the stomach.

4.2 MOST IMPORTANT SYMPTOMS AND EFFECTS, BOTH ACUTE AND DELAYED
ROUTE(S) OF ENTRY: Skin Contact; Eye Contact
HUMAN EFFECTS AND SYMPTOMS OF OVEREXPOSURE:
ACUTE SKIN CONTACT: This product is irritating to the skin resulting in reddening, stinging, and swelling.
ACUTE EYE CONTACT: This product is irritating to the eyes resulting in stinging, reddening, tearing, and swelling.
CHRONIC EFFECTS OF EXPOSURE: No applicable information was found concerning any adverse chronic health effects from overexposure to this product.
CARCINOGENICITY: The components of this product are not listed by NTP, IARC or regulated as a carcinogen by OSHA.
MEDICAL CONDITIONS
AGGRAVATED BY EXPOSURE: Persons with pre-existing eye or skin disorders may be more susceptible to the effects of this product.

4.3 INDICATION OF ANY IMMEDIATE MEDICAL ATTENTION AND SPECIAL TREATMENT NEEDED.
None Anticipated

SECTION 5: FIRE-FIGHTING MEASURES

5.1 EXTINGUISHING MEDIA
Water spray, dry powder, carbon dioxide or media appropriate for surrounding fire. Use of water jet may cause explosive dust conditions.

Safety Data Sheet

CITRIC ACID FCC/USP PWD

5.2 SPECIFIC HAZARDS
FIRE AND EXPLOSION HAZARD: Possibility of dust explosion. It is recommended that all dust control equipment and material transport systems involved are engineered to prevent conditions contributing to dust explosions. Do not allow dust to accumulate on flat surfaces, on rafters or building structural components. Use of water jet may cause explosive dust conditions.
SEE NFPA 61, Standard for the prevention of Fire and Dust Explosions in Agricultural and Food Processing Facilities, 2008 or later Edition, and other related standards.

5.3 SPECIFIC PROTECTIVE EQUIPMENT AND PRECAUTIONS FOR FIRE-FIGHTERS
Wear self-contained breathing apparatus and full protective gear. Use water spray to cool fire exposed containers.

FLAMMABILITY CLASS (OSHA)
Not applicable

HAZARDOUS COMBUSTION PRODUCTS
Carbon dioxide and carbon monoxide

SECTION 6:ACCIDENTAL RELEASE MEASURES

6.1 PERSONAL PRECAUTIONS
Use personal protective equipment. Wear eye protection. Avoid contact with skin and eyes.

6.2 ENVIRONMENTAL PRECAUTIONS
Prevent further leakage or spillage if safe to do so. No special environmental precautions required

6.3 METHODS FOR CLEANING UP
Vacuum or sweep spills. Minimize dust generation.
If washing down spilled area is necessary, use copious amounts of water and control runoff.
Follow local, state and federal regulations for product disposal

6.4 REFERENCE TO OTHER SECTIONS
See Section 7 for information on safe handling
See Section 8 for information on personal protection equipment
See Section 13 for disposal information

SECTION 7: HANDLING AND STORAGE

Safety Data Sheet

CITRIC ACID FCC/USP PWD

7.1 PRECAUTIONS FOR SAFE HANDLING
See NFPA 61, Standard for the Prevention of Fire and Dust Explosions in Agricultural and Food Processing Facilities, 2008 Edition, and other related standards. Use with adequate ventilation. Minimize dust generation and accumulation; dust deposits should not be allowed to accumulate on surfaces, as these may form an explosive mixture if they are disturbed.

All dust control equipment and material transport systems involved are engineered to prevent conditions contributing to dust explosions and may require explosion relief vents or an explosion suppression system or an oxygen-deficient environment. Bonding and grounding systems may be required.

Dust-handling systems (such as exhaust ducts, dust collectors, vessels, and processing equipment) should be designed to limit or prevent leakage of dust into the work area.

Do not allow dust to accumulate on flat surfaces, on rafters or building structural components. Routine housekeeping should be instituted to reduce dust accumulation. Use Avoid dispersal of dust in the air; use vacuum or wet sweeping methods. Do not use compressed air to clean surfaces.

Keep away from all ignition sources including heat, sparks, and flame. Where dust accumulations occur use non-sparking tools.

7.2 CONDITIONS OF SAFE STORAGE, INCLUDING ANY INCOMPATIBILITIES
Store in a cool dry place. Store in a tightly closed container/bag.
The packaging material should have reasonable moisture and air barriers and comply with food regulations.
7.3 SPECIFIC END USE(S)
See overview of the exposure scenario and summary of risk management measures in Appendix 1

SECTION 8: EXPOSURE CONTROLS / PERSONAL PROTECTION

8.1 CONTROL PARAMETERS
Exposure limits: Nuisance dust (also called particulate not otherwise regulated (PNOR)).
OSHA PEL: 15 mg/ mg/m3 Total dust
5 mg/m3 Respirable dust
ACGIH TLV: 10 mg/m3 Inhalable dust
5 mg/m3 Respirable dust
15 mg/m3 Total dust

Safety Data Sheet

CITRIC ACID FCC/USP PWD

8.2 EXPOSURE CONTROLS
APPROPRIATE ENGINEERING CONTROLS:
Ventilation: See NFPA 61, Standard for the Prevention of Fire and Dust Explosions in Agricultural and Food Processing Facilities, 2008 Edition, and National Fire Protection Association 650, Standard for Pneumatic Conveying Systems for Handling Combustible Materials, 1997 Edition and other related standards. Normal industrial hygiene measures should be sufficient for protection of employees from exposure to dusts. Local and mechanical exhaust is desirable when dumping bags.

APPROPRIATE PERSONAL PROTECTIVE EQUIPMENT:
Eye protection: Safety glasses are recommended. Safety goggles are desirable when dumping bags.
Emergency wash facilities: Eye wash is recommended for conditions where dust generation is likely.
Special protective clothing: Not normally required.
Gloves: Not normally required. Use ordinary work gloves if dust dries skin.
Respirator: NIOSH approved N-95 dust respirator if working in situations that could generate large amounts of airborne dust.

FOR FIREFIGHTING AND OTHER IMMEDIATELY DANGEROUS TO LIFE OR HEALTH CONDITIONS:
See section 5.

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

9.1 INFORMATION ON BASIC PHYSICAL AND CHEMICAL PROPERTIES

- Physical form	Solid
- Color	White to off-white
- Odor	Essentially odorless to very slight sugar odor
- pH (concentration)	NA
- Boiling point	104°C (219 °F)
- Flash point	345°C
- Melting/freezing point	approx. 153°C at 1,013 hPa
- Decomposition temperature	NA
- Auto-ignition temperature	NA
- Explosion properties	NA
- Oxidising properties	NA
- Vapour pressure	2.21*10-6 Pa at 25°C
- Vapor density	0.62 (Air = 1)
- Relative density	1.665at 20°C

Safety Data Sheet

CITRIC ACID FCC/USP PWD

- Bulk density	Not Established
- Specific gravity	15 °C (1.24 at 59 °F)
- Viscosity	Not Established
- Water solubility	590 g/L at 20°C
- Solubility (non aqueous)	Methyl alcohol: completely miscible
- Partition coefficient	In OCTANOL/ WATER (log value): Log Kow: -0.2 to -1.8
- Dissociation constant	pKa: 3.13, 4.76 and 6.4 at 25°
- Evaporation rate	Less than 1 (Butyl acetate =1)

9.2 OTHER INFORMATION

SECTION 10: STABILITY AND REACTIVITY

10.1 REACTIVITY
Stable

10.2 CHEMICAL STABILITY
Stable under normal conditions.
Polymerization will not occur.

10.3 POSSIBILITY OF HAZARDOUS REACTIONS
Not applicable

10.4 CONDITIONS TO AVOID
Practices which produce dust or disperse finely divided dust in air.
See NFPA 61. Standard for the Prevention of Fire and Dust Explosions in Agricultural and Food Processing Facilities, 2008 Edition, and other related standards.

10.5 INCOMPATIBLE MATERIALS
Oxidizing agents, strong acids

10.6 Hazardous decomposition products:
Nothing unusual

SECTION 11: TOXICOLOGICAL INFORMATION

11.1 INFORMATION ON TOXICOLOGICAL EFFECTS

- Inhalation	ORAL: LD50: 5400 – 5790 mg/kg bw (mouse) / LD50: 11700 mg/kg bw (rat) DERMAL: LD50 >2000 mg/kg bw rat
- Ingestion	No effects known or anticipated.

Safety Data Sheet

CITRIC ACID FCC/USP PWD

- Skin irritation / corrosion	Sustained exposure in a dusty manufacturing environment may result in mechanical irritation in the creases of the skin, particularly at the fingers, or other drying effects. no health effects known or anticipated.
- Eye irritation	Irritating to eyes.
- Skin sensitisation	Not sensitizing
- Chronic toxicity	Not known or anticipated
- Genetic toxicity	Not known or anticipated
- Carcinogenicity	Not classifiable as Carcinogen.
- Reprotoxicity	Not known or anticipated
- Specific effects	Not applicable

SECTION 12: ECOLOGICAL INFORMATION

12.1 TOXICITY
LC50 for freshwater fish: 440 mg/l
EC50/LC50 for freshwater invertebrates: 1535 mg/l.

12.2 PERSISTENCE/DEGRADABILITY
Ready biodegradable

12.3 BIOACCUMULATIVE POTENTIAL
Log Kow <3, not bioaccumulative

12.4 MOBILITY IN SOIL
Not applicable

12.5 BPT, vPvB
The substance does not meet the criteria for PBT or vPvB.

12.6 OTHER ADVERSE EFFECTS
None known

SECTION 13: DISPOSAL CONSIDERATIONS

13.1 WASTE TREATMENT METHODS
Follow local, state and federal regulations for product disposal. Not a hazardous waste unless contaminated with hazardous products.

SECTION 14: TRANSPORTATION INFORMATION

Safety Data Sheet

CITRIC ACID FCC/USP PWD

International regulations (RID/ADR; RTMDR; IMDG; IATA/OACI): Not classified as dangerous for transport.
DOT shipping label: Non-hazardous

SECTION 15: REGULATORY INFORMATION

15.1 SAFETY, HEALTH AND ENVIRONMENTAL REGULATIONS
According with the version of the Globally Harmonized System of Classification and labeling adopted in the United States and Regulation 1272/2008/EC(CLP): Classified

15.2 CHEMICAL SAFETY ASSESSMENT
US FEDERAL REGULATIONS:
Clean Air Act:
ODS: Not applicable.
SARA (EPCRA) Section 313 (40 C.F.R. § 372.65): Not applicable.
TSCA Status: On TSCA inventory.

STATE REPORTING REQUIREMENTS:
California Proposition 65: Not applicable.

SECTION 16: OTHER INFORMATION

See Hazard Communication Guidance for Combustible Dusts, OSHA 3371-08 2009, U.S. Occupational Safety and Health Administration, https://www.osha.gov/Publications/3371combustible-dust.html (accessed 10/8/14)
And
NFPA 654, Standard for the Prevention of Fire and Dust Explosions from the Manufacturing, Processing, and Handling of Combustible Particulate Solids, for general safe handling and design guidance.

Other classifications of the substance:
TSCA STATUS: On TSCA Inventory.
FDA STATUS: Citrus acid, Anhydrous complies with FDA Regulation 21 C.F.R. § 184.1033;
CALIFORNIA PROPOSITION 65: Not applicable.
HMIS rating:
Health: 1
Flammable: 0

Safety Data Sheet

CITRIC ACID FCC/USP PWD

Reactivity: 0
(0 = minimal ; 1 = slight ; 2 = moderate ; 3 = serious ; 4 = severe)

Safety Data Sheet according to Commission Regulation (EU) No 453/2010 of 20 May 2010 amending Regulation (EC) No 1907/2006 of the European Parliament and of the Council on the Registration, Evaluation, Authorization and Restriction of Chemicals (REACH)

DISCLAIMER OF LIABILITY

The information in this SDS is collected from reliable sources. However, the information is provided without any warranty, expressed or implied. The conditions or methods of handling, storage, use or disposal of the product might be beyond our control and knowledge. For the avoidance of doubt, we shall in no such circumstances be under any liability in respect of loss, damage or expenses arising from handling, storage, use or disposal of the product by your company and/or your subcontractors. This SDS is only applicable for the product mentioned in the identification chapter and title. If the product is used as a component in another product, this SDS may not be applicable on the composite material.

Annex I

SUMMARY OF RISK MANAGEMENT MEASURES
Safe use has been demonstrated by calculation of risk characterisation ratios where appropriate, while qualitative considerations were stipulated where quantification was not possible. The risk characterisation is based on the following risk management measures:
Exposure scenario ,,Description ,,General measures ,,Specific Human Health risk management measures ,,Specific Environment risk management measures ,,
ES1 ,,Production and intermediate use on production sites ,,Good working practices, containment and safe handling in line with industry best practice. ,,(i) Local Exhaust ventilation (LEV)
(ii) Personal Protective Equipment (PPE): Working clothing, protective gloves and safety glasses. Dust masks in areas where dust may be present. In case of open handling of larger quantities or accidental release, a particle mask or respirator with independent air supply is recommended. ,,(i) Treatment of effluent in waste water treatment plant. ,,
ES2, 3, 4, 5, 6, 7, 8, 9, 11, 12, 13, 14, 15, 16, 17 ,,Industrial use ,,
Good working practices, containment and safe handling in line with industry best practice. ,,(i) Local Exhaust ventilation (LEV) if
aerosol mists or dusts are present.
(ii) Personal Protective Equipment (PPE): Working clothing, protective gloves and safety glasses. Dust masks in areas where dust may be present. In case of open handling of larger quantities or accidental release, a particle mask or respirator with independent air supply is

Safety Data Sheet

CITRIC ACID FCC/USP PWD

recommended. ,,(i) Treatment of effluent in waste water treatment plant. ,,
ES10 ,,Textile industry ,,Good working practices, containment and safe handling in line with industry best practice. ,,(i) Local Exhaust ventilation (LEV) if aerosol mists or dusts are present.
(ii) Personal Protective Equipment (PPE): Working clothing, ,,(i) Treatment of effluent in waste water treatment plant.
(ii) No direct discharge into the marine environment ,,

DOWNHOLE TOOLS/REAMERS

© Copyright, Michels Directional Crossings, a Division of Michels Corporation, 2018

Reaming Tools/Equipment

The reamers utilized for hole-opening operations are custom fabricated by Michels Corporation, however equivalent or better tools may be substituted depending on availability of other suppliers' products, or, if changes in anticipated drilling conditions are encountered. Michels R&D program for downhole tools includes monitoring of performance & longevity of reaming equipment in differing soil conditions throughout North America as well as foreign destinations. Utilizing the latest technology, tooling and materials available to the industry is a continuing goal of Michels.

There is essentially no limit to the length of time these tools can be run since simple repairs can be made in the field to keep the reamers in good working condition. The condition of the reamers will depend on the type of ground encountered; typically these reamers are discarded when they are observed to be beyond field repair. Initial maximum run time for specific reamers recommended by Michels is 50-100 hours.

DRILL FLUID RECYCLING
MUD CLEANING EQUIPMENT

© Copyright, Michels Directional Crossings, a Division of Michels Corporation, 2018

Drill Mud Cleaning and Disposal

The first phase of the mud cleaning system is displacement of solid returns at the shakers. Heavy solids are sifted out by a shaker with screens and deposited into a pit. From here they will be transported by dump truck to a site for disposal.

Drill Mud Cleaning Equipment Specifications

Volume of Mixing/Scalper Tank	54.0-Bbls
Volume of Desander Tank	72.0-Bbls
Volume of Desilter Tank	72.0-Bbls
Quantity of Scalping Shakers	1.0-Shakers
Mesh Size of Scalping Shakers	10-20 Double Stacked
Desander Capability	2 @ 500-GPM (1,000 GPM Total)
Desander Cones	2.0-Cones
Desander Mesh Size	40 to 165
Quantity of Desilter Cones	10 Ea @ 100-GPM
Desilter Mesh Size	60 to 250
Steel Mud Circulating Tank Volume	160-Bbls
Returns Tank Volume (Mud Pit)	320-Bbls
Cuttings Tank Volume (20-yd Roll-off)	150-Bbls
Mud Screening, Max Pass Size	40 Mesh

Due to the quantity and types of mud pumps owned by Michels and located on multiple drill sites Michels utilizes one of the following pumps based on availability and geographic location:

Bentonite Pump Capabilities (ENTRY/EXIT)

Name Brand	Gardner Denver OPI-350
Liner Size	6-Inches
Maximum Pressure	1,469 PSI
Maximum Flow Rate	529 GPM
Gallons Per Stroke	2.94 Gallons Per Stroke

Proprietary to Michels

Bentonite Pump Capabilities (ENTRY/EXIT SIDE)

Name Brand..... Ellis Williams W-446 Super Force Triplex Piston Model

Liner Size..... 6-Inches

Maximum Pressure..... 1,027 PSI

Maximum Flow Rate..... 661 GPM

Gallons Per Stroke..... 2.20 Gallons Per Stroke

Bentonite Pump Capabilities (ENTRY/EXIT SIDE)

Name Brand..... Gardner Denver OPI-700

Liner Size..... 7-Inches

Maximum Pressure..... 1,690 PSI

Maximum Flow Rate..... 599 GPM

Gallons Per Stroke..... 3.99 Gallons Per Stroke

Proprietary to Michels

Michels Directional Crossings Pipeline Rollers

General Description: Steel tubing welded frame supporting two urethane coated rollers. Pillow block bearings are used to mount the rollers. The rollers are opposed to each other and set @ 125° to accommodate various pipe sizes.

Size: Footprint of 50”x48” with overall height of 40”

Load Capacity: 167,000 Lbs per assembly

Shafts: Material is steel 4140, 2-15/16 Diameter.

Frame: Frame weldment made of steel ASTM A-500 Grade square tubing

Rollers: 11” O.D., 20” face width, 8-5/8” core size. Coating is urethane approximately 1” thick (95 Shore-A)

Bearings: 4-required per assembly, 2 on each coated roller. Manufacturer is Linkbelt, Part Number PB22447E w/ 2-15/16” spherical roller, self aligning, contact seal.

Load Capacity for Bearings;

Basic = 41,800 Lbs
Static = 71,500 Lbs,
L-10 Life = 9,410 Hours @ 300 RPM

Proprietary Michels

MICHELS®

Horizontal Directional Drilling

CONTINGENCY PLANS

Michels believes contingency planning begins with the appointment of competent field personnel having the greatest amount of experience to complete a project. Michels' personnel are some of the most qualified drilling experts in the industry, as demonstrated by resumes and experience lists highlighting past projects completed. With the abundant resources at their disposal, Michels has overcome risks associated with some of the most difficult drilling projects ever attempted and has evolved into an industry leader. Michels Project Managers are some of the best in the industry utilizing the many resources available while coordinating the various facets of a productive drill site.

Michels' Drill Superintendents are highly experienced at utilizing drill rigs and ancillary equipment of every size. They have worked up though the ranks providing them a complete and comprehensive understanding of safety, environmental monitoring, manpower, equipment operations and repairs for each phase of the drilling operation. As noted on the attached resumes, each Superintendent has drilled throughout North America and has encountered varying soil conditions, from sands, gravels, clay and cobble to solid rock formation. They are well respected throughout the industry and have worked with a majority of the major Pipeline Construction Companies in North America. Michels' personnel maintain continuous certification through accredited schooling for all phases of the drilling operation.

Contingency planning is conducted in response to unforeseen events and conditions, which could occur during normal operating sequences. The following contingency plans are in place to ensure completion of the project in accordance with governing authorities. The Field Operations Superintendent oversees preventative measures before product line installation. This alleviates the probability for adverse conditions such as stuck pipe. The following are some of the more common variables, which we have developed contingency plans for. They include but are not limited to:

Proprietary to Michels

© Copyright, Michels Directional Crossings, a Division of Michels Corporation

Possible Condition: *Inadvertent Drill Fluid Release Response and Control*

Contingency:

A large reduction or sudden loss in drill fluid returns is a signal to the driller and monitoring personnel that monitoring for inadvertent returns should be intensified for possible surface release. Therefore, the proposed drill R.O.W. will be inspected for inadvertent returns at a minimum of twice per shift and becoming more frequent if there is a large reduction or sudden loss. The frequency and results of R.O.W. inspections will be documented and recorded on the daily reports. Early detection and quick response is the key to controlling and/or limiting surface release. Additional information regarding access to USACE-Owned Land is addressed later in this document.

The absence of an open bore-hole conduit or the presence of a major formation fracture can lead to partial and/or potentially total loss of drilling fluid circulation. While it is impossible to determine the precise nature of this type of fluid loss, it is possible to accurately monitor for it by watching for a significant difference between the rate fluid is being pumped down-hole and the rate it returns to the surface. The drilling fluid pumping rate and the rate of drilling fluid return to the surface is constantly monitored by the mud technician and relayed to the driller while the HDD operation is progressing. The driller will know immediately if an unusually high volume of drilling fluid is being lost down-hole, depending on the ground conditions encountered in the crossing and taking into account the volume used to fill the bore-hole. Should the driller believe that circulation is being completely lost he will implement the following procedures:

1) Temporarily cease drilling operations, including pump shut down;
2) Dispatch experienced observers as required to monitor the area in the vicinity of the crossing, for inadvertent returns of drilling fluid at the surface or in the river;
3) Identify the position of the drill head in relation to the point of entry
4) Re-start the pump and stroke the bore-hole up and down in stroke lengths up to 30 feet up to 6 times but no fewer than 2 in an effort to size the bore-hole annulus and re-open the circulation pathway.

Proprietary to Michels

© Copyright, Michels Directional Crossings, a Division of Michels Corporation

In addition, the thixotropic properties of the drilling fluid may be thickened within the guidelines set forth by the manufacturer to aid in re-establishing circulation as required depending on bore-hole conditions. Observers will regularly monitor for inadvertent fluid returns as long as the pump remains on. Occasionally, based on the driller's discretion, it may be useful to increase the stroke length up to 90 feet or past the point at which he believes circulation was lost.

If circulation is re-established, drilling will proceed as usual and monitoring for inadvertent fluid will take place once again if the rate of drilling returns progressively decreases at the fluid entry pit. If circulation is not re-established, monitoring for inadvertent fluid returns to the ground surface and river will continue and drilling will proceed.

If the amount of inadvertent returns is not great enough to allow practical collection, the affected area will be diluted with fresh water and allowed to dry and dissipate naturally back into the earth. If the amount of returns exceeds that which can be suitably contained with hand placed containment barriers, small collection sumps (less than 3.8 cubic meters) will be used to pump fluid back to the solids control system.

When drilling fluid returns are observed to be continuously surfacing above ground at an accessible location the following procedure will be followed:

1) Immediately cease pumping of drilling fluid;
2) Contain the location such that the drilling fluid cannot migrate across the ground surface;

On-Site Materials and equipment used for containment:

- Straw Bales, if available;
- Silt Fence;
- Check Dams;
- Backhoe for Accessible Areas;
- Shovels;

Proprietary to Michels

© Copyright, Michels Directional Crossings, a Division of Michels Corporation

- Portable Pumps;
- 100 feet of Hose.

3) Excavate a small sump pit at the location and provide a means for the fluid to be returned to either the drilling operations or a disposal site (i.e. pump through hose or into tanker);
4) Notify on-site contractor supervisor and Owner's representative as required by the communication plan;
5) Continue drilling operations, maintain the integrity of the containment measures, and monitor the fluid returns as required to ensure that no surface migration occurs;
6) Clean-up is carried out once inadvertent returns are contained/controlled;
7) Fluid pumped to a secure containment vessel;
8) Area is diluted with water;
9) Area is restored to original condition.

If inadvertent drilling fluid returns are observed to be surfacing above-ground at a location that is inaccessible, i.e. along the bed of a water body, or, into the water, the following procedures will be followed:

Ensure that all reasonable measures within the limitations of the technology have been taken to re-establish circulation;

Continue drilling with the minimum amount of drilling fluid required to penetrate the formation and successfully install the product line.

Typically lost circulation has the highest probability of occurring while the pilot hole is being drilled due to the smaller bore-hole annulus and the relatively large volume of solids being displaced and carried out in the drilling fluid. In the course of drilling the pilot hole, circulation will often be temporarily lost as the pilot bit is advanced through more permeable or less

Proprietary to Michels

© Copyright, Michels Directional Crossings, a Division of Michels Corporation

competent sections of the ground formation when fluid pressures are at a maximum. As the pilot bit advances beyond these sections of the bore-hole fluid pressure will fall and circulation within the bore-hole will naturally be re-established. Much of the fluid lost to the formation under the greater pressures will return back to the bore-hole as the pressures fall, in which case the drilling fluid is not likely to migrate to the surface or the river. It is also possible for the drilling fluid to leave the bore-hole and migrate in a direction other than the ground surface or the wetland, in which case it may never be observed even if circulation is lost for long periods of time.

It should be noted that frequently drill cuttings generated as a result of the drilling process will naturally bridge and subsequently seal fractures or voids as drilling progresses, thus providing another means of re-establishing circulation. This is especially likely during the reaming process as higher volumes of larger cuttings are typically generated. Therefore it is usually beneficial to proceed with the pilot hole even if circulation has not been re-established since it will likely be re-established at some point during the reaming process.

The use of an environmentally safe drilling fluid ensures that even in the unlikely event of fluid loss at sensitive areas, there will be no adverse environmental impact other than a temporary minor increase in turbidity until the drilling fluid dissipates. It is important to note that any temporary increase in turbidity as a result of inadvertent drilling fluid loss while directional drilling the crossing will be several orders of magnitude less than that of an open-cut crossing.

Contingency Access Plan for USACE-Owned Lands in Event of Unanticipated Return

In event of an unanticipated return of drilling fluid on U.S. Army Corps of Engineer (USACE) owned lands, WBI Energy, Inc. (WBI) and its contractors would mobilize clean-up crews as soon as practicable. Crews would utilize access points and routes identified on Figures 1 and 2 (North Side and South Side of the Lake Sakakawea horizontal directional drill). To the extent practicable WBI Energy will use publically available access roads to reach inadvertent return cleanup areas. WBI and its contractors will notify landowners prior to the commencement of HDD drilling activities and will work expediently to contact landowners in event of an inadvertent return.

If necessary, equipment used to access and clean-up inadvertent returns of drilling fluid on the ground surface of USACE owned property would include rubber tired vehicles, such as pick-ups

Proprietary to Michels

© Copyright, Michels Directional Crossings, a Division of Michels Corporation

and vacuum trucks (vac-trucks). It is anticipated that for an inadvertent return of drilling fluid to the ground surface, access to USACE owned property would follow the paths illustrated on Figures 1 and 2, the primary route on both sides of the Lake Sakakawea HDD would be along the permanent right-of-way leading from the drill box to the banks above the shoreline. From the permanent right-of-way, a direct perpendicular route would be taken to reach the site of the inadvertent return with the shortest path. To the maximum extent practicable, woody vegetation (trees and shrubs) will not be cleared; access paths would avoid trees and general vegetation disturbance to the maximum extent practicable. Where necessary crews will travel around persistent, live, woody vegetation.

If access is necessary along the beach on either the north side of Lake Sakakawea, as shown in Figure 1, or the south side of Lake Sakakawea, as shown in Figure 2, crews will either access the clean-up location by walking in, or utilizing small, low ground pressure equipment, such as UTVs or ATVs. A secondary option for beach access would be to mobilize a small boat from a public dock to bring personnel and cleanup equipment to the beach. Every effort will be made to access clean-up sites, if necessary, from the higher ground along the permanent right-of-way. After clean-up of drilling fluid is complete, crews will follow the same path out that was taken in to the inadvertent return, to minimize additional disturbance. Calls will be made to the appropriate USACE point of contact as soon as feasible, but not greater than 24 hours from the time crews are mobilized to clean-up the inadvertent return.

Attachment – Figure 1

Attachment – Figure 2

Possible Condition: *EQUIPMENT MALFUNCTION/FAILURE-SPARE PARTS*

Contingency: Based on past experience, Michels can reasonably estimate the average life expectancy of all major components of the drilling operation under normal operating conditions. The operating hours of the equipment are recorded prior to start of drilling operations and maintained throughout completion of the crossing. Documentation and maintenance records are maintained by the drilling superintendent so that replacement of key components can be routinely performed in a timely manner to prevent failure. Occasionally, a component of the drilling operation will fail unexpectedly even with the most stringent maintenance and replacement schedule. These types of failures have occurred in the past and

© Copyright, Michels Directional Crossings, a Division of Michels Corporation

Michels has established a spare parts inventory with each drill rig based on the most common failures of this type. Spare parts kept on site include hydraulic pumps, flendor motors, and drive gears. In addition, odd sized or extremely high pressure hydraulic hoses that are not readily available "off the shelf" are kept on site.

Major Spare Parts kept on-site

- 1,800-Mission pump
- 2,500-Halco pump
- Mud Rig – Clutch and Transmission
- 11 – Vise Blocks
- 4 - Vise Hydraulic Rams
- 2 - Rotary Motors
- 2 – Drive Motors
- 1 – Hydraulic Pump
- 2 – Vise Travel Motors
- 1 – Circulation Pump
- 2 – Mud Swivels
- 2 – Complete Rebuilds for OPI-350
- Rebuild Parts for EW-446
- Electric Motor for Halco
- Electric Motor for Cooling Fans
- 2 – Shaker Motors

It is not feasible to maintain a complete spare parts inventory with each drilling rig on site so Michels immediately identifies local sources for commonly available spare parts and equipment upon job start up. Spare parts not readily available locally are kept in one of four Michels' permanent warehouse locations in Bothell, Washington; Adrie, Alberta Canada; Harrisburg, Pennsylvania; or Brownsville, Wisconsin, where the parts can be shipped overnight to the job site to prevent extensive down time caused as a result of equipment failure if necessary.

Possible Condition: *STUCK PIPE*

Contingency: The following are some of the preventative measures invoked by the Drilling Foreman in order to reduce the chances for complications while pulling back product pipe.

1. Utilize drilling equipment capable of supplying enough power to remove seized pipe from either entry or exit location.

Proprietary to Michels

© Copyright, Michels Directional Crossings, a Division of Michels Corporation

2. Performing an extra reaming pass with the purpose of cleaning out the reamed hole (not a cutting pass) and adding proper lubrication with precise weight bentonite mixture.
3. Reduce torsional and axial loads through the use of properly spaced rollers, well maintained swivels and creating a smooth transition between downhole exit angle and pipe strung out on top of ground readied for pullback.
4. Utilize Ballasting to control the weight of the pipe by achieving negative or neutral buoyancy.

Contingencies for stuck pipe

If above preventative methods fail and the pipe become seized in the borehole we invoke Best Available Control Technology (BACT). One of the methods involves specific techniques in conjunction with ballasting, which is controlled loading with water. Past experience has shown us that if the leading end of the pipe remains too heavy during ballasting, air can be supplied to this area of pipe, displacing water back toward the middle, and in some circumstances freeing up the point of greatest friction.

If the drilling rig is unable to supply the initial thrust to release the seized pipe, side booms and or track-hoes can supply thrusting pressure from the exit side in order to start momentum. Michels drilling rigs have the potential to supply up to 1,200,000 pounds of thrust and pulling-force, add additional equipment and there is not much that cannot be dislodged.

Not only can force be applied from the drill-rig side but additional force can be applied from the pipe installation side for large diameter installations through the use of a Herrenknect pipe thruster for land to land crossings. This alternative source of power supplied from the opposite end can dramatically assist large diameter pipe pullback during significant changes in the effective weight of the pipe during pullback (buoyancy) caused by either losing circulation or re-establishing circulation unexpectedly therefore causing drastic changes in the buoyancy of the pipe. This method also reduces the risk for damage to pipe coating during pullback by reducing the tensile force needed to pull back the pipe. If the large diameter pipe becomes stuck additional control can be established to move pipe back and forth in the event gravel, cobble and/or boulder sized

Proprietary to Michels

© Copyright, Michels Directional Crossings, a Division of Michels Corporation

materials fall in the hole after swabbing. This can be used as an alternative to the percussion hammer which has been used as a contingency measure on previous past projects.

(See Attachment Herrenknect Pipe Thruster)

If percussion assistance is determined to be necessary to supply the energy required to complete the pullback operation, Michels is capable of performing this operation utilizing a GrundoRam percussion hammer supplied by TT-Technologies. The work area needed for invoking hammer assist procedures is located on the pipe pullback side of the crossing. This will encompass an area of 40-feet long x 20-feet wide for staging of the "Taurus" GrundoRam percussion hammer and assist equipment. This pipe-ramming machine has a thrust of up to 2,000 tones and a ramming speed of 180-strokes/minute. A GrundoRam and 1600 CFM air compressor will be made available by Michels on-site. Additional sources for spare parts and accessories should also be identified.

(See Attachment Grundo-Ram Percussion)

A specially manufactured reinforced push ring is positioned at the back end of the product line so that equal transmission of percussion energy can be transmitted down the product pipe, and to protect the steel pipe end while in contact with the GrundoRam "Taurus". The persistent exertion of energy along the descending steel pipeline aids in aggressively sliding the pipe through suspect areas of unconsolidated formation or through areas of cave-in. Although this is not a regular occurrence due to mitigative measures taken prior to installation, Michels has successfully completed this unique form of pipeline pullback assist periodically over the past 10-years and has built a solid reputation as an innovator in this field.

Possible Condition: *INCLEMENT WEATHER*

Contingency: Key personnel monitor long range forecasts for the project areas to be affected. Various weather services (i.e. NOAA, Weather Channel etc) are monitored by computer for bad weather and potential hurricanes. Regular updates are given to Michels' personnel to make them aware of approaching weather conditions. Evacuation routes will be identified and reviewed with all personnel for potential hurricanes prior to beginning work and responsibilities will

Proprietary to Michels

© Copyright, Michels Directional Crossings, a Division of Michels Corporation

be assigned. If electrical storms are projected to affect a drill site, approaching storms will be monitored by radar and radio and communication will be maintained between Project Manager and personnel. Electrical storms can potentially cause serious problems for a drilling operation. The Drill Superintendent must use his discretion as to the appropriate safe action to be taken for the safety of the crew and entire drilling operation. Proper grounding must be maintained throughout a drilling operation.

A safe area on the site will also be designated for response to an approaching tornado. Stream gages will also be identified and monitor for potential flooding conditions.

Possible Condition: *NOISE*

Contingency: Noise reduction can be accomplished using several methods. To begin with, a site reconnaissance or noise modeling must be completed by the Owner to determine what decibel (dB) level will be allowable at the affected locations. Some of the Noise Control Considerations include: Redirection of sound waves or deadening just by the simple positioning of drilling equipment and strategic location of frac-tanks. This option generally has little affect upon cost and may cause minor inconveniences for the drilling operation.

Another option is to utilize hospital/industrial grade mufflers to deaden sound as it leaves engines of motorized equipment. This could impede maximum operating output from equipment and also slow down the drilling operation.

More costly forms of Sound Control include; Building walls made of hay bales, sound curtain matting or plywood, or, building sound deadening enclosures constructed of wood.

Possible Condition: *DAMAGE TO EXISTING UTILITIES*

Contingency: Preventative measures include proper notification of local utilities through area one-call programs or site investigation and recording of area markers, manholes and valves. Pot-holing existing utilities is the most reliable method of exact utility location

Proprietary to Michels

© Copyright, Michels Directional Crossings, a Division of Michels Corporation

Damage to existing utilities or structures may occur during drilling or reaming operations. Occasionally unknown or unmarked utilities may be hit during drilling or reaming operations. If this circumstance does occur the type of utility is first identified so that severity of response can be identified. Emergency personnel for the identified utility are then notified. Pertinent personnel for the Owner and/or Owner Representatives are then notified, following the chain of command. Decisions are then made as to appropriate action to be taken.

Possible Condition: *ENCOUNTERING SUBSURFACE OBSTRUCTION*

Contingency: Occasionally an unknown subsurface obstruction is encountered during drilling operations such as; 1) buried tanks, 2) Building foundations/piers/pilings, 3) buried junk/cars. If this situation occurs, the location of the object is first identified in relation to the drill path. If the current R.O.W. is ample and soils provide adequate steering capabilities, the drill head is pulled back to a pre-calculated point along the previously drilled path and the drill bit is rotated and steered around the obstruction.

The chance of encountering an obstruction during reaming operations is highly unlikely. But, if this should occur, the magnitude of the obstruction must first be evaluated. If the obstruction is determined to be impassible, operations will be halted until an agreeable solution can be determined.

Possible Condition: *RUNNING SANDS*

Contingency: It is possible that loose cohesionless soils, such as running sands, may not support the drilled annular space over a long directional drill length. Although this circumstance sounds serious, it may not prevent the installation of a pipeline. Mechanical agitation of the formation by the downhole tool and trailing drill string, combined with the injection of bentonite drilling fluid causes the soils to experience a decrease in shear strength. When the resulting shear strength is low enough, the soil will react in a fluid-like manner thus, allowing the pipeline to be pulled through it.

Proprietary to Michels

© Copyright, Michels Directional Crossings, a Division of Michels Corporation

It would be highly unusual for soil strata to be of the same consistency from drill entry to drill exit, especially at the various depths encountered during pilot hole drilling. Prior to drilling, only general soil information is known for estimating and hypothesizing. The type of drilling fluid providing the best performance capabilities for the conditions is chosen based upon this information. Adjustments are then made in the field correlating to specific soil properties in order to improve performance.

Possible Condition: *PIPELINE MISALIGNMENT*

Contingency: Today's technology in the directional drilling industry provides state of the art instrumentation and tracking capabilities. The directional drill alignment is accurately known to within ± 0.01° or, ± 1.4 feet per 1,000 feet in both profile and plan view. The addition of Para Tracker as a secondary form of verification and validation for plan view orientation, left and right of center line, provides precise information which is updated regularly during drilling operations. The most frequent cause of misalignment is the inability to steer in transitional zones near the exit location. These soils may include varying degrees of overburden or formations allowing unpredictable degrees of penetration. The orientation or angle of these zones from horizontal may deflect the drill bit having a direct affect upon steering capabilities.

In any case, the steering probe maintains its tracking capabilities and allows the Survey Technician continuous feedback for locating the drill string in a three dimensional plane. Any deviation from the targeted exit is known and can be compensated for. If the target area is not large enough to accommodate the deviation, the drill string can be pulled back to a calculated point and be redirected toward the proposed exit location.

Possible Condition: *PRESSURE CONTROL*

Contingency: An important function of the drilling fluid is to prevent the uncontrolled entry into the hole of fluids from the formation penetrated by the bit. The pressure exerted by the column of drilling fluid (hydrostatic head) must be somewhat greater than the pressure exerted by the formation fluids to allow raising the drill string without any problems. Following are some mitigative measures taken to counteract pressures.

Proprietary to Michels

© Copyright, Michels Directional Crossings, a Division of Michels Corporation

1. Avoid swabbing drill string (plunging the drill string back and forth with great force)
2. Keep the hole full of drill mud while pulling the drill pipe, especially when hydrostatic head is not much greater than formation pressure.

At any given depth, the hydrostatic pressure (in psi) of the mud column is equal to mud density (in lb/gal) times depth (in feet) times 0.052

Psi (hydrostatic pressure)	=	lb/gal (density)	x	feet (depth)	x	0.052

Possible Condition: *HOLE COLLAPSE*

Contingency: Most drillable formations, whether consolidated or unconsolidated, have some form of cohesive properties allowing drilling fluid to interact and add to its bonding properties, thus avoiding hole collapse. Some soils, such as large gravel zones or cobble areas may not be capable of holding a hole. If this type of formation exists in the overburden soil (upper strata), a steel casing pipe may be washed over the drill stem into competent soil and left in place during operations. Drilling and reaming operations will then resume utilizing this conduit as a means of carrying drill cuttings back up-hole without obstruction. This reduces the chance for lost circulation. Under this circumstance, the integrity of the pipe coating **cannot** be guaranteed.

If this type of formation exists throughout the borehole, it should be known and researched prior to drilling so that an alternate route may be researched. The route that provides the best chance for success should be the route chosen. If a competent drilling contractor properly investigates a route, the chance for a hole collapse is greatly reduced.

Proprietary to Michels

Possible Condition: *PIPELINE COLLAPSE*

Contingency: Pipeline collapse during pulling operations is a rare occurrence caused by certain factors, which must be considered before pullback begins. Some of the main factors, which must be considered during pre-planning stages or prior to pipeline pullback operations, include:

© Copyright, Michels Directional Crossings, a Division of Michels Corporation

1. Pre-engineered profile must reflect the minimum radius of curvature calculated for the given pipe (wall thickness, pipe size, tensile strength, X-rating)
2. Drilled profile should not exceed pipe tolerance throughout the drilled borehole.
3. Experienced directional drilling Survey Technician verifies three joint radii calculations for maximum degree of bend per 30-foot joint.
4. Industry standard safety factor should be included in the profile and calculations taking into account unknowns.
5. Exit and entry angles must be within specified tolerances so that support equipment capabilities are not exceeded in order to provide the pipeline a smooth, uninhibited transition into the opened hole.
6. Calculations performed for anticipated stresses the pipe will be subjected to during pullback (i.e. Pull loads, tensile, unconstrained buckle, hoop stress.) This way upper stress limits will be known.
7. Proper ballasting of product line through controlled loading of water to the leading end of pipeline. This procedure also provides internal pressure to the product line as a counter balance to external pressures. If water is added to the opened end of the product line and allowed to flow down toward the leading end during pullback, a vacuum may occur creating undue stress on the product line which would increase the possibility of implosion or collapse. Therefore, a conduit is positioned to carry water through the interior of the product pipe dispersing water at the leading end of the pipe filling it from the lowest portion (elevation) toward the highest elevation. Volume calculations are maintained to ensure only the lowest portion of the pipe is maintained full of water.

The appointment of highly competent personnel experienced in pipeline pullback procedures is a must. There is no substitute for experience. Experienced personnel should be placed at critical positions at both the drill entry and exit locations.

GRUNDO RAM
PNEUMATIC PIPE RAMMER

Proprietary to Michels

© Copyright, Michels Directional Crossings, a Division of Michels Corporation

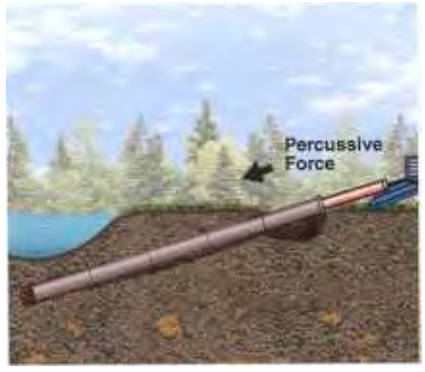
Percussive Power

for directional drilling assist

Conductor Barrel™

A sure start for your bore even in the worst soil.

- Ram casings through difficult soil conditions to more desirable drill starting points.
- Guide down-hole or mud motors to rocky soils through the conductor barrel.
- Provides friction-free section for product pullback.



Pullback Assist

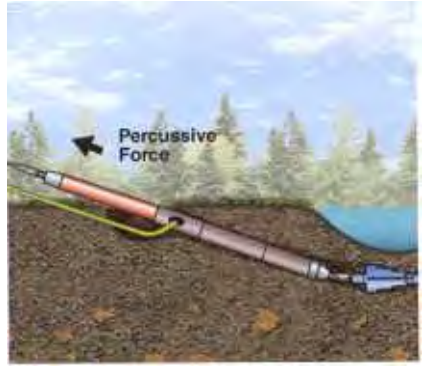
Overcome hydrolock with a pipe rammer.

- Rammer attached to product pipe during pullback.
- Percussive action keeps pipe moving and helps prevent high levels of pullback stress.
- Percussive power frees immobilized product pipes.

Pipe Removal

Remove stuck product pipe and bore again.

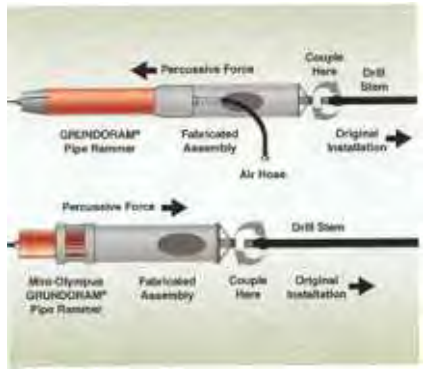
- Rammer attached to product pipe after pullback fails.
- Percussive action pulls product pipe, removing it from the bore.
- Salvage the job and bore again.



Drill Stem Recovery

Retrieve stuck drill stems.

- Pipe Rammer fitted with a special sleeve.
- Stuck drill stem welded to the back of the rammer sleeve.
- Percussive power frees drill stem, saving time and money.



"Power without limits!"

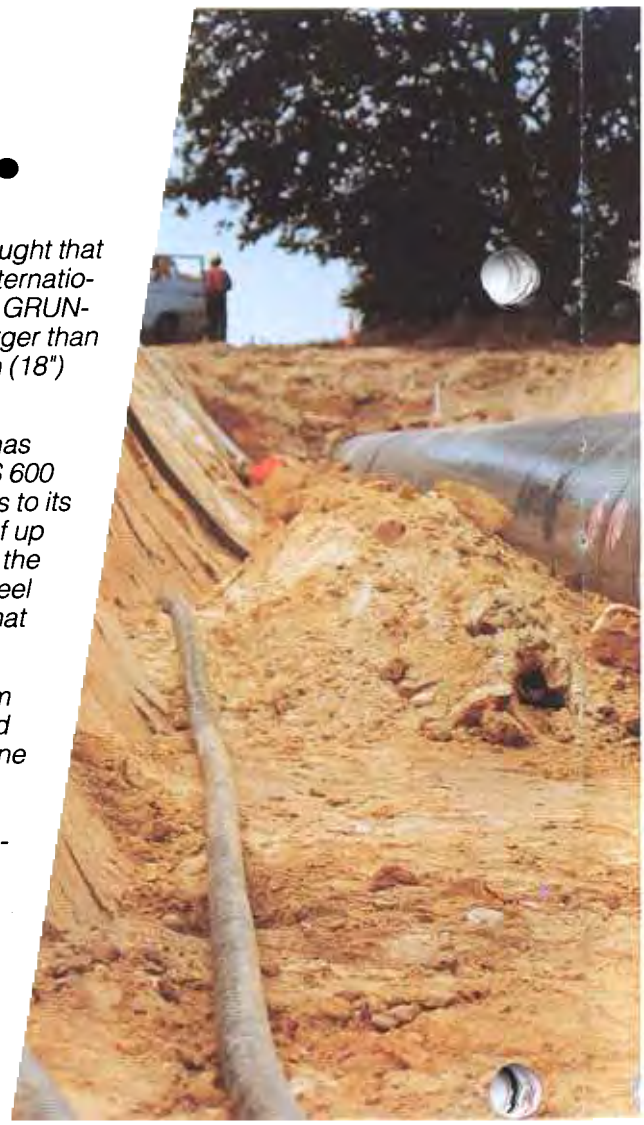
The strongest in existance ...

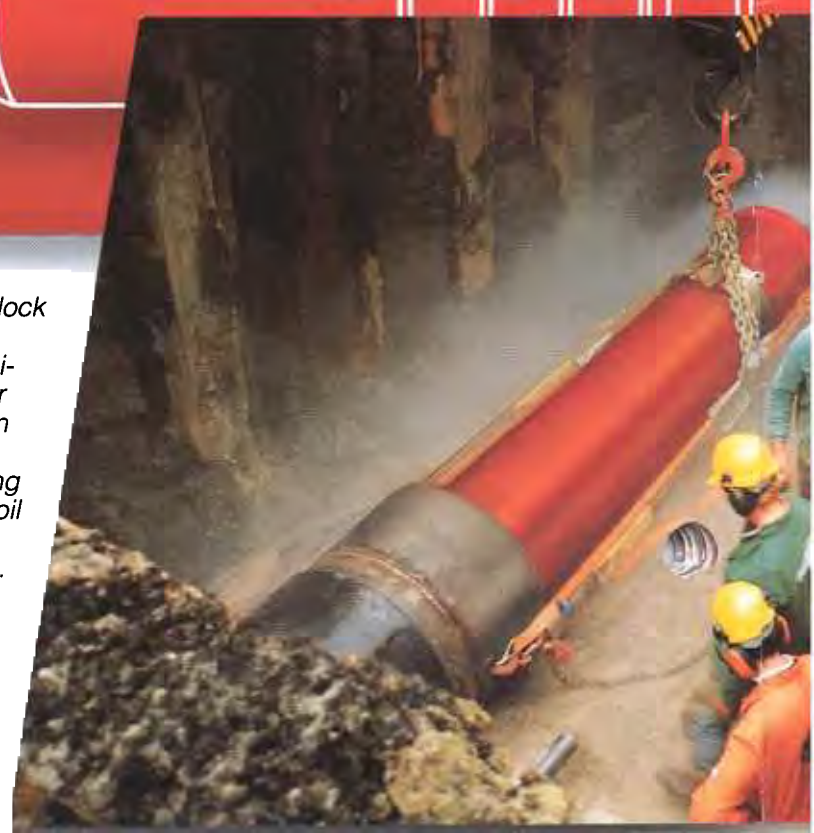
Who would have thought that there would be an international requirement for a GRUNDORAM hammer - larger than the GOLIATH 450 mm (18") machine?

International demand has made the new TAURUS 600 mm (24") a must. Thanks to its dimensions and thrust of up to 2,000 tons (4,480 lbs) the TAURUS is the largest steel pipe ramming machine that exists.

Steel pipes up to 2,000 mm (80") can now be installed with this powerful machine when installing casing or product pipes for the water, sewage, telephone, electricity and gas industries or railway authorities.

When other ramming equipment has reached its power limit the TAURUS offers that extra power to get that pipe into the ground.





It is designed of a monoblock main casing made from a high quality alloy with a unique flexible control stud for perfect impact transmission onto the steel pipe. This makes it a reliable and lasting boring unit even in difficult soil conditions or over long stretches of steel pipe installation.

A GRUNDORAM's number of strokes has a direct influence on the forward ramming speed. However, high ground

TAURUS

Ø of rammer.....	.....24"

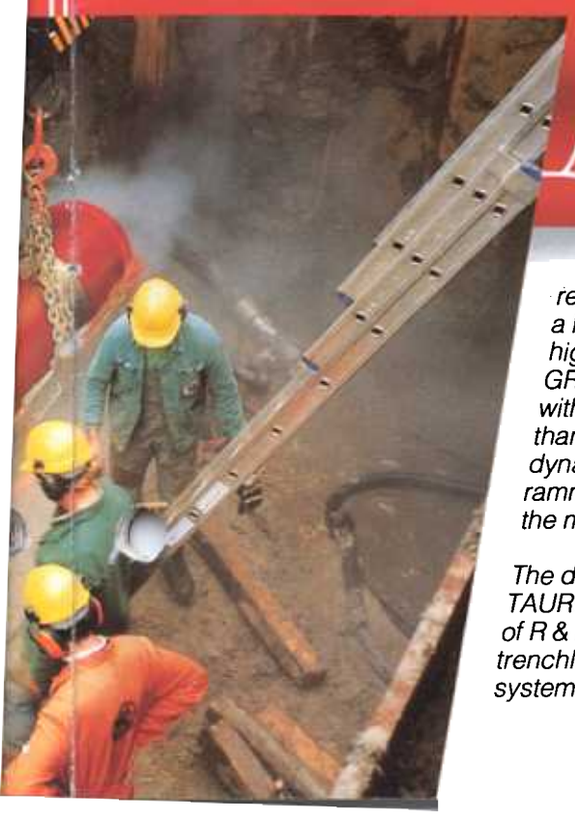
A TAURUS used on a gas pipeline installation.



resistance and friction require a low stroke frequency with a higher single impact. The GRUNDORAM model TAURUS with 180 strokes/min and more than 2,000 tons (4,480 lbs) of dynamic thrust ensures high ramming speeds even under the most difficult conditions.

The development of the new TAURUS is the result of years of R & D in the field of trenchless pipe laying systems.

The GRUNDORAM is suitable to resist the highest stress in difficult soils thanks to its monoblock casing and flexible control stud.

GRUNDORAM

Good examples back up our claims

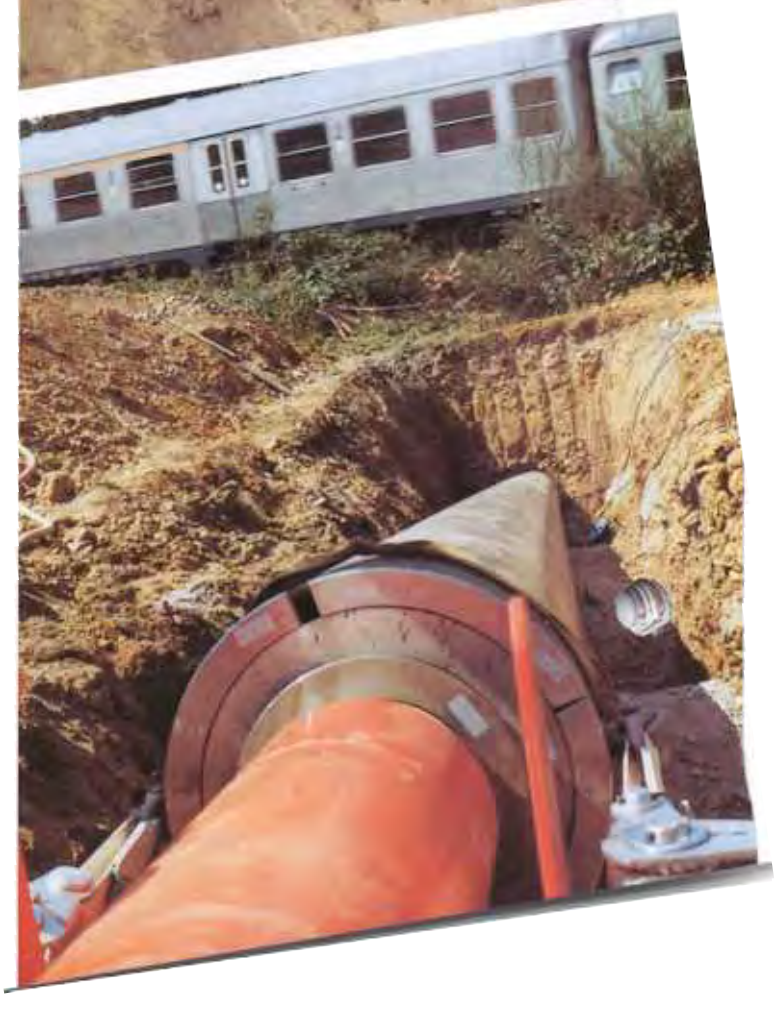
Global usage is quickly leading to the general acceptance of the robust GRUNDORAM system. Contractors value the ● simple operation and ● reliability the ● enormous impact power, the ● wide range of applications, the ● quick and easy preparation and the ● sturdy accessories.

● 220 ft of steel pipe, 14" diameter was rammed under a canal to accommodate 8 fibre-optic cables.

● 125 ft of 59" diameter pipe was laid under an embankment in Manchester, England, as a drainage system.

● 65 steel pipes of 28" diameter were installed parallel to each other under the main Seoul-Pusan railway line in South Korea.

● A 24" steel pipe was easily rammed along a 131 ft stretch under a railway embankment south of Cairo/Egypt.



"Typical" but also not everyday jobsite projects are excellent references, for example

● 115 ft of steel drainage pipe of 55" diameter was perfectly installed under the river Pader in the heart of the city of Paderborn/ Germany

● 200 ft of 30" steel casing for gas/telecom/mains supply was installed under the A 1 motorway without traffic disruption or diversions

● *90 steel pipes of 20" diameter were driven in vertically to provide solid foundations for a noise-protection barrier in Germany.*

There are many other typically good examples that could be listed. If you are interested in specific cases, contact us - we will supply you with detailed information.

Additional Power for Pipe Pullback.

The newly developed Herrenknecht Pipe Thruster is an auxiliary device for Horizontal Directional Drilling Technology and extends its field of application. The Thruster is mounted at the exit point and helps to push the entire pipeline into the ground. It is particularly suited for extremely long pipelines, very large diameters or difficult geological conditions. Depending on the project the Pipe Thruster can be used as a support tool, a rescue tool or as a pipe installation tool.

After finishing the pilot hole and the reaming procedures using a HDD Rig the Pipe Thruster assists during the pipe pull. The Pipe Thruster is mounted at the exit point and pushs the product pipe into the enlarged hole while the Rig is pulling the pipe. This simultaneuos process will reduce the stresses on the drillpipe and the product pipe.

Beside improved safety the Pipe Thruster allows drill lengths of more than 3,000m and makes the use of big pipe diameters more common.

HERRENKNECHT
Tunnelling Systems

Innovative Solution: The Pipe Thruster

Range of Application

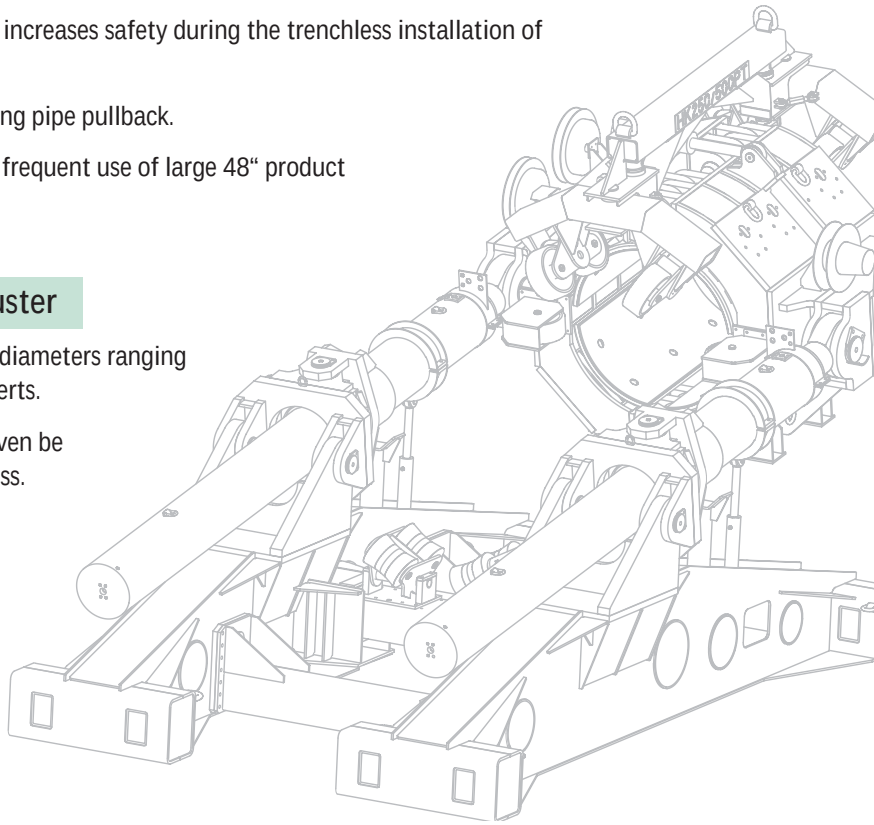
- Support of the HDD process during pipe pullback.
- Sea Outfall projects: ashore thrusting of the product pipeline.
- Rescue Tool for the recovery of stucked pipelines, e.g. in difficult geological conditions.

Advantages of the Method

- The deployment of the Pipe Thruster allows to add a push force from the exit point to the pull force of the HDD Rig.
- The flexible load distribution at the entry and exit point increases safety during the trenchless installation of pipelines considerably.
- Reduced stress for drill pipes and rigsite equipment during pipe pullback.
- Increase of drill lengths to more than 3,000m and more frequent use of large 48“ product pipe diameters.

Advantages of the Herrenknecht Pipe Thruster

- The Herrenknecht Pipe Thruster can be used for all pipe diameters ranging between 20“ and 48“ by just changing the clamping inserts.
- Due to a tilting clamping device the Pipe Thruster can even be installed when the pipeline pullback is already in progress.
- The clamping device is suitable for all types of pipelines and coatings.
- The modular design does not require special cargo transports.



Technical Data

Pipe Thruster

- Operating angle: 5° - 15°
- Push and pull force (normal): 250t (2,500kN)
- Push and pull force (maximum): 500t (5,000kN)
- Min. clamp diameter: 20“ (508mm)
- Max. clamp diameter: 48“ (1,219mm)
- Max. speed: 5m/min.
- Stroke of push/pull cylinder: 5,000mm
- Dimensions: 9 x 4.1 x 4.4m
- Weight: 45t

Power Unit

- Dimensions: 20ft container
- Installed power: 400kW
- Weight: 10t
- Remote control and hydraulic hoses to the Pipe Thruster are included.

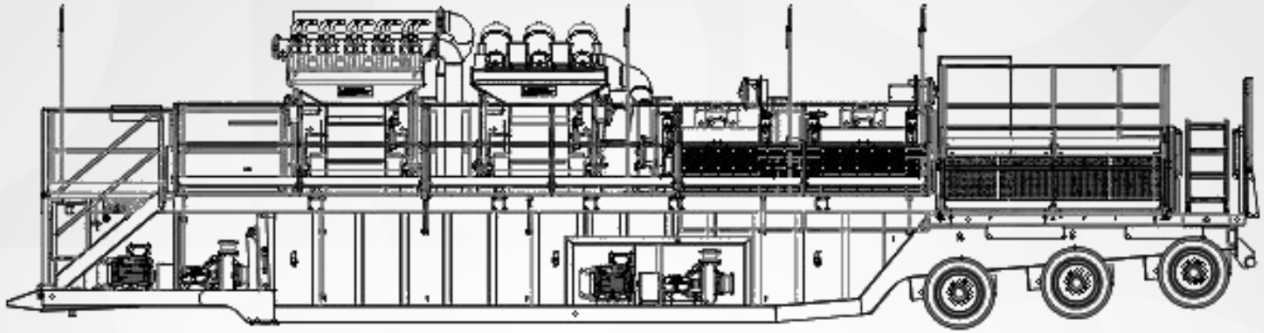
DRILL FLUID RECYCLING FLOW CHART

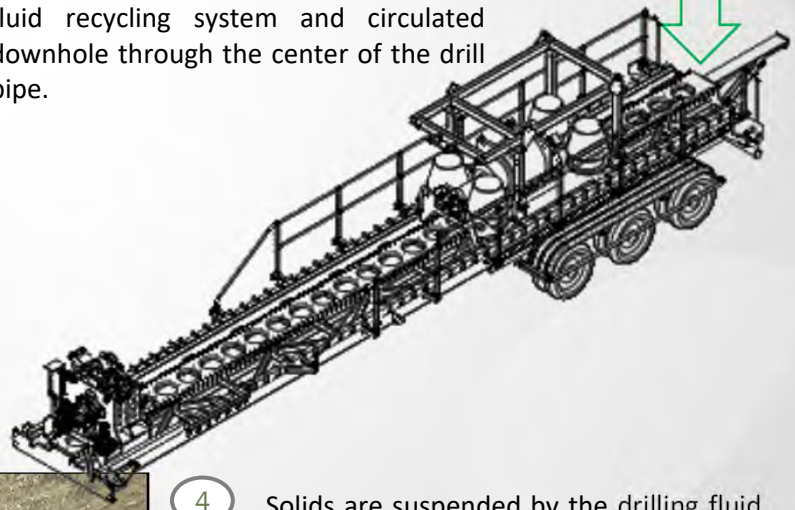
© Copyright, Michels Directional Crossings, a Division of Michels Corporation, 2018

1 Drilling fluid volume is initially prepared consisting primarily of bentonite (NSF/ANSI-60 Drinking Water Additive Standard Certified) & water. Pumps are used to circulate the fluid downhole.



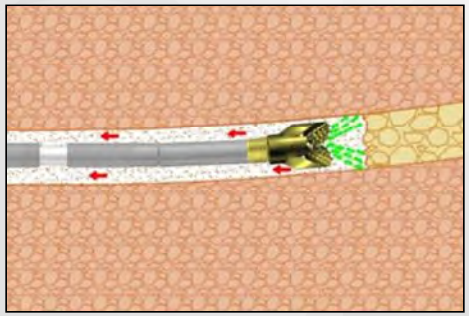
CLEAN FLUID

2 Drilling fluid is pumped from the drilling fluid recycling system and circulated downhole through the center of the drill pipe.



3 Once downhole, drilling fluid serves the following purposes;

- In alluvial formations, assists with jetting the hole
- Transports cuttings to the surface
- Aids in stabilizing formations
- Provides lubrication & tool cooling
- Provides hydrostatic fluid pressure to balance formation pressure.



SOLIDS LADEN FLUID

4 Solids are suspended by the drilling fluid downhole and transported throughout the annular space to the entry pit at surface.

5 Solid laden drilling fluid returns to the recycling system where it is processed by large particle shakers, de-sanders & de-silters. It is during this stage that the suspended cuttings are removed and the desired drilling fluid rheology is restored.

WBI ENERGY TRANSMISSION, INC.
North Bakken Expansion Project
Section 408 Application

Attachment 2
Surface Use Plan of Operation

August 2020

WBI ENERGY TRANSMISSION, INC.
NORTH BAKKEN EXPANSION PROJECT
SURFACE USE PLAN OF OPERATION

1.0 PROJECT DESCRIPTION

WBI Energy Transmission, Inc. (WBI Energy) proposes to construct and operate the North Bakken Expansion Project (or Project), which consists of an approximately 62-mile-long, new 24-inch-diameter natural gas pipeline from new facilities at WBI Energy's Tioga Compressor Station near Tioga, North Dakota, to a new compressor station (Elkhorn Creek Compressor Station) southeast of Watford City, North Dakota.

The Project also involves construction of approximately 0.3 mile of new 24-inch-diameter natural gas pipeline between the proposed Elkhorn Creek Compressor Station to a new interconnect with Northern Border Pipeline Company, approximately 20.4 miles of new 12-inch-diameter natural gas pipeline looping along WBI Energy's Line Section 25, approximately 9.4 miles of new 12-inch-diameter natural gas pipeline looping along WBI Energy's Line Section 30, approximately 0.5 mile of new 20-inch-diameter receipt lateral to the Tioga Compressor Station, and uprating of WBI Energy's Line Section 25. The Project includes additional horsepower at the Tioga Compressor Station; the installation of new and modifications to existing delivery, receipt and transfer stations along WBI Energy's pipeline routes; the replacement of small segments of pipeline facilities; and the installation of block valves, pig launcher/receiver stations and other associated appurtenances.

The Project will require crossing of the Lake Sakakawea Reservoir, which is managed by the U.S. Army Corps of Engineers (USACE), along with USACE-owned lands adjacent to Lake Sakakawea. WBI Energy proposes to install the natural gas pipeline under Lake Sakakawea and USACE lands using the horizontal directional drill (HDD) construction method, a trenchless method designed to avoid direct impacts to sensitive features. The HDD workspaces will be located adjacent to USACE-owned lands on the north side of the lake, and approximately 800 feet from USACE-owned lands on the south side of Lake Sakakawea. No surface impact to USACE lands is anticipated for this Project during installation and operation of the pipeline; all temporary surface impacts will be located outside of USACE lands. Access in the area of the proposed HDD will be along public and private roads.

2.0 CONSTRUCTION TECHNIQUE

The proposed HDD will be approximately 2.9 miles (15,393 feet) in length and will cross 12,934 feet of USACE-owned lands. For the HDD crossing of Lake Sakakawea, WBI Energy anticipates using the intersect method, where a single alignment is achieved by drilling from both ends so as to connect the drills underground. Electromagnetic sensors located on the tip of the drill bit will allow the operator to follow the sensor grid along the prescribed path. Once the pilot hole is completed, the sensor grid will be removed and the hole will be enlarged through a process called reaming. A reaming tool will be installed at one end of the drill string on the exit side of the pilot hole, and then pushed or drawn back to the drill rig to enlarge the hole. Several passes with progressively larger reaming tools may be required to enlarge the hole to a sufficient diameter to accommodate the pipeline. During this process, drilling fluid, or mud, consisting of in-situ material and water (and possibly bentonite clay) will be circulated through the hole to remove drill cuttings and maintain the integrity of the hole. Once the reaming process is complete, a prefabricated segment of pipe will be attached to the drill string on the exit side of the crossing, and pulled back

through the hole toward the drill rig. The pipe segment will generally be hydrostatically tested prior to its installation, and once installed, connected on either side of the crossing to adjoining sections of pipe. The pipe segment will be hydrostatically tested a second time with the remainder of the pipeline system.

3.0 LAND REQUIREMENTS

WBI Energy has requested that the USACE issue a real estate easement across Lake Sakakawea and on adjacent USACE-owned lands. The requested easement would be 50-feet (25-feet either side of centerline) in width and 12,934 feet in length centered on the proposed pipeline. A legal description of the requested easement is provided in Appendix A – Easement Plats.

WBI Energy will maintain the easement according to easement provisions. No surface occupancy of USACE land is proposed as part of the Project. Additionally, WBI Energy does not propose to maintain vegetation (i.e., clear, mow, or apply herbicide) within the easement on USACE lands during operation of the pipeline. However, WBI Energy will conduct periodic inspections of the pipeline right-of-way as outlined in WBI Energy Transmission – Gas System Operation and Maintenance Manual (CUI/PRIV – DO NOT RELEASE included as Appendix A of Attachment 6 of the 408 Permit Application package). The proposed Project will be incorporated into WBI Energy's extensive Supervisory, Control, and Data Acquisition System (SCADA). The Gas Control Center is located at WBI Energy's headquarters in Bismarck, North Dakota, and is staffed 24 hours a day, 365 days a year. Gas controllers use SCADA to monitor the pipeline system, which includes a wide range of activities such as monitoring gas pressures and flows along the pipeline, physical startup and shutdown of compressor sites, and operating system valves along the pipeline.

Data acquisition occurs at many locations along the mainline, such as compressor stations, and meter stations. This data is transmitted to Gas Control through SCADA. If system parameters fall outside a predetermined range, an alarm is activated at Gas Control and corrective action is taken by the gas controller as needed. Local WBI Energy personnel are dispatched in response to these alarms if intervention is required outside Gas Control. WBI Energy will also conduct a baseline assessment using in-line inspection of the proposed pipeline in accordance with U.S. Department of Transportation requirements to check for damage, deformities, or other factors that could affect the integrity of the pipelines. If potential problems are identified and maintenance or repair of the pipeline is required, WBI Energy would request separate authorization from the USACE and other applicable agencies to repair or maintain the pipeline.

Attachment 3

Erosion Sedimentation Control Plan

WBI ENERGY TRANSMISSION, INC.
North Bakken Expansion Project
Section 408 Application

Attachment 3
Erosion and Sedimentation Control Plan

August 2020

WBI ENERGY TRANSMISSION, INC.
NORTH BAKKEN EXPANSION PROJECT
EROSION AND SEDIMENTATION CONTROL PLAN

WBI Energy Transmission, Inc. (WBI Energy) proposes to construct and operate the North Bakken Expansion Project (or Project), which consists of an approximately 61.9-mile-long, new 24-inch-diameter natural gas pipeline from new facilities at WBI Energy's Tioga Compressor Station near Tioga, North Dakota, to a new compressor station (Elkhorn Creek Compressor Station) southeast of Watford City, North Dakota.

The Project also involves construction of approximately 0.3 mile of new 24-inch-diameter natural gas pipeline between the proposed Elkhorn Creek Compressor Station to a new interconnect with Northern Border Pipeline Company, approximately 20.4 miles of new 12-inch-diameter natural gas pipeline looping along WBI Energy's Line Section 25, approximately 9.4 miles of new 12-inch-diameter natural gas pipeline looping along WBI Energy's Line Section 30, approximately 0.5 mile of new 20-inch-diameter receipt lateral to the Tioga Compressor Station, and uprating of WBI Energy's Line Section 25. The Project includes additional horsepower at the Tioga Compressor Station; the installation of new and modifications to existing delivery, receipt and transfer stations along WBI Energy's pipeline routes; the replacement of small segments of pipeline facilities; and the installation of block valves, pig launcher/receiver stations and other associated appurtenances.

The Project will require crossing of the Lake Sakakawea Reservoir, which is managed by the U.S. Army Corps of Engineers (USACE), along with USACE-owned lands adjacent to Lake Sakakawea. WBI Energy proposes to install the natural gas pipeline under Lake Sakakawea and USACE lands using the horizontal directional drill (HDD) construction method, a trenchless method designed to avoid direct impacts to sensitive features. The HDD workspaces will be located adjacent to USACE-owned lands on the north side of the lake, and approximately 800 feet from USACE-owned lands on the south side of Lake Sakakawea. No surface impact to USACE lands is anticipated for this Project during installation and operation of the pipeline; all known temporary surface impacts will be located outside of USACE lands.

Construction of the Project will be completed in adherence to the Federal Energy Regulatory Commission's *Upland Erosion Control, Revegetation, and Maintenance Plan* and *Wetland and Waterbody Construction and Mitigation Procedures*, which are attached for reference as Appendix A and B, respectively.

UPLAND EROSION CONTROL, REVEGETATION, AND MAINTENANCE PLAN (PLAN)

I. APPLICABILITY

A. The intent of this Plan is to assist project sponsors by identifying baseline mitigation measures for minimizing erosion and enhancing revegetation. Project sponsors shall specify in their applications for a new FERC authorization and in prior notice and advance notice filings, any individual measures in this Plan they consider unnecessary, technically infeasible, or unsuitable due to local conditions and fully describe any alternative measures they would use. Project sponsors shall also explain how those alternative measures would achieve a comparable level of mitigation.

Once a project is authorized, project sponsors can request further changes as variances to the measures in this Plan (or the applicant's approved plan). The Director of the Office of Energy Projects (Director) will consider approval of variances upon the project sponsor's written request, if the Director agrees that a variance:

1. provides equal or better environmental protection;

2. is necessary because a portion of this Plan is infeasible or unworkable based on project-specific conditions; or

3. is specifically required in writing by another federal, state, or Native American land management agency for the portion of the project on its land or under its jurisdiction.

Sponsors of projects planned for construction under the automatic authorization provisions in the FERC's regulations must receive written approval for any variances in advance of construction.

Project-related impacts on wetland and waterbody systems are addressed in the staff's Wetland and Waterbody Construction and Mitigation Procedures (Procedures).

II. SUPERVISION AND INSPECTION

A. ENVIRONMENTAL INSPECTION

1. At least one Environmental Inspector is required for each construction spread during construction and restoration (as defined by section V). The number and experience of Environmental Inspectors assigned to each construction spread shall be appropriate for the length of the construction spread and the number/significance of resources affected.

2. Environmental Inspectors shall have peer status with all other activity inspectors.

3. Environmental Inspectors shall have the authority to stop activities that violate the environmental conditions of the FERC's Orders, stipulations of other environmental permits or approvals, or landowner easement agreements; and to order appropriate corrective action.

B. RESPONSIBILITIES OF ENVIRONMENTAL INSPECTORS

At a minimum, the Environmental Inspector(s) shall be responsible for:

1. Inspecting construction activities for compliance with the requirements of this Plan, the Procedures, the environmental conditions of the FERC's Orders, the mitigation measures proposed by the project sponsor (as approved and/or modified by the Order), other environmental permits and approvals, and environmental requirements in landowner easement agreements.

2. Identifying, documenting, and overseeing corrective actions, as necessary to bring an activity back into compliance;

3. Verifying that the limits of authorized construction work areas and locations of access roads are visibly marked before clearing, and maintained throughout construction;

4. Verifying the location of signs and highly visible flagging marking the boundaries of sensitive resource areas, waterbodies, wetlands, or areas with special requirements along the construction work area;

5. Identifying erosion/sediment control and soil stabilization needs in all areas;

6. Ensuring that the design of slope breakers will not cause erosion or direct water into sensitive environmental resource areas, including cultural resource sites, wetlands, waterbodies, and sensitive species habitats;

7. Verifying that dewatering activities are properly monitored and do not result in the deposition of sand, silt, and/or sediment into sensitive environmental resource areas, including wetlands, waterbodies, cultural resource sites, and sensitive species habitats; stopping dewatering activities if such deposition is occurring and ensuring the design of the discharge is changed to prevent reoccurrence; and verifying that dewatering structures are removed after completion of dewatering activities;

8. Ensuring that subsoil and topsoil are tested in agricultural and residential areas to measure compaction and determine the need for corrective action;

9. Advising the Chief Construction Inspector when environmental conditions (such as wet weather or frozen soils) make it advisable to restrict or delay construction activities to avoid topsoil mixing or excessive compaction;

10. Ensuring restoration of contours and topsoil;

11. Verifying that the soils imported for agricultural or residential use are certified as free of noxious weeds and soil pests, unless otherwise approved by the landowner;

12. Ensuring that erosion control devices are properly installed to prevent sediment flow into sensitive environmental resource areas (e.g., wetlands, waterbodies, cultural resource sites, and sensitive species habitats) and onto roads, and determining the need for additional erosion control devices;

13. Inspecting and ensuring the maintenance of temporary erosion control measures at least:

    a. on a daily basis in areas of active construction or equipment operation;

    b. on a weekly basis in areas with no construction or equipment operation; and

    c. within 24 hours of each 0.5 inch of rainfall;

14. Ensuring the repair of all ineffective temporary erosion control measures within 24 hours of identification, or as soon as conditions allow if compliance with this time frame would result in greater environmental impacts;

15. Keeping records of compliance with the environmental conditions of the FERC's Orders, and the mitigation measures proposed by the project sponsor in the application submitted to the FERC, and other federal or state environmental permits during active construction and restoration;

16. Identifying areas that should be given special attention to ensure stabilization and restoration after the construction phase; and

17. Verifying that locations for any disposal of excess construction materials for beneficial reuse comply with section III.E.

III. PRECONSTRUCTION PLANNING

The project sponsor shall do the following before construction:

A. CONSTRUCTION WORK AREAS

1. Identify all construction work areas (e.g., construction right-of-way, extra work space areas, pipe storage and contractor yards, borrow and disposal areas, access roads) that would be needed for safe construction. The project sponsor must ensure that appropriate cultural resources and biological surveys are conducted, as determined necessary by the appropriate federal and state agencies.

2. Project sponsors are encouraged to consider expanding any required cultural resources and endangered species surveys in anticipation of the need for activities outside of authorized work areas.

3. Plan construction sequencing to limit the amount and duration of open trench sections, as necessary, to prevent excessive erosion or sediment flow into sensitive environmental resource areas.

B. DRAIN TILE AND IRRIGATION SYSTEMS

1. Attempt to locate existing drain tiles and irrigation systems.

2. Contact landowners and local soil conservation authorities to determine the locations of future drain tiles that are likely to be installed within 3 years of the authorized construction.

3. Develop procedures for constructing through drain-tiled areas, maintaining irrigation systems during construction, and repairing drain tiles and irrigation systems after construction.

4. Engage qualified drain tile specialists, as needed to conduct or monitor repairs to drain tile systems affected by construction. Use drain tile specialists from the project area, if available.

C. GRAZING DEFERMENT

Develop grazing deferment plans with willing landowners, grazing permittees, and land management agencies to minimize grazing disturbance of revegetation efforts.

D. ROAD CROSSINGS AND ACCESS POINTS

Plan for safe and accessible conditions at all roadway crossings and access points during construction and restoration.

E. DISPOSAL PLANNING

Determine methods and locations for the regular collection, containment, and disposal of excess construction materials and debris (e.g., timber, slash, mats, garbage, drill cuttings and fluids, excess rock) throughout the construction process. Disposal of materials for beneficial reuse must not result in adverse environmental impact and is subject to compliance with all applicable survey, landowner or land management agency approval, and permit requirements.

F. AGENCY COORDINATION

The project sponsor must coordinate with the appropriate local, state, and federal agencies as outlined in this Plan and/or required by the FERC's Orders.

1. Obtain written recommendations from the local soil conservation authorities or land management agencies regarding permanent erosion control and revegetation specifications.

2. Develop specific procedures in coordination with the appropriate agencies to prevent the introduction or spread of invasive species, noxious weeds, and soil pests resulting from construction and restoration activities.

3. Develop specific procedures in coordination with the appropriate agencies and landowners, as necessary, to allow for livestock and wildlife movement and protection during construction.

4. Develop specific blasting procedures in coordination with the appropriate agencies that address pre- and post-blast inspections; advanced public notification; and mitigation measures for building foundations, groundwater wells, and springs. Use appropriate methods (e.g., blasting mats) to prevent damage to nearby structures and to prevent debris from entering sensitive environmental resource areas.

G. SPILL PREVENTION AND RESPONSE PROCEDURES

The project sponsor shall develop project-specific Spill Prevention and Response Procedures, as specified in section IV of the staff's Procedures. A copy must be filed with the Secretary of the FERC (Secretary) prior to construction and made available in the field on each construction spread. The filing requirement does not apply to projects constructed under the automatic authorization provisions in the FERC's regulations.

H. RESIDENTIAL CONSTRUCTION

For all properties with residences located within 50 feet of construction work areas, project sponsors shall: avoid removal of mature trees and landscaping within the construction work area unless necessary for safe operation of construction equipment, or as specified in landowner agreements; fence the edge of the construction work area for a distance of 100 feet on either side of the residence; and restore all lawn areas and landscaping immediately following clean up operations, or as specified in landowner agreements. If seasonal or other weather conditions prevent compliance with these time frames, maintain and monitor temporary erosion controls (sediment barriers and mulch) until conditions allow completion of restoration.

I. WINTER CONSTRUCTION PLANS

If construction is planned to occur during winter weather conditions, project sponsors shall develop and file a project-specific winter construction plan with the FERC application. This filing requirement does not apply to projects constructed under the automatic authorization provisions of the FERC's regulations.

The plan shall address:

1. winter construction procedures (e.g., snow handling and removal, access road construction and maintenance, soil handling under saturated or frozen conditions, topsoil stripping);

2. stabilization and monitoring procedures if ground conditions will delay restoration until the following spring (e.g., mulching and erosion controls, inspection and reporting, stormwater control during spring thaw conditions); and

3. final restoration procedures (e.g., subsidence and compaction repair, topsoil replacement, seeding).

IV. INSTALLATION

A. APPROVED AREAS OF DISTURBANCE

1. Project-related ground disturbance shall be limited to the construction right-of-way, extra work space areas, pipe storage yards, borrow and disposal areas, access roads, and other areas approved in the FERC's Orders. Any project-related ground disturbing activities outside these areas will require prior Director approval. This requirement does not apply to activities needed to comply with the Plan and Procedures (i.e., slope breakers, energy-dissipating devices, dewatering structures, drain tile system repairs) or minor field realignments and workspace shifts per landowner needs and requirements that do not affect other landowners or sensitive environmental resource areas. All construction or restoration activities outside of authorized areas are subject to all applicable survey and permit requirements, and landowner easement agreements.

2. The construction right-of-way width for a project shall not exceed 75 feet or that described in the FERC application unless otherwise modified by a FERC Order. However, in limited, non-wetland areas, this construction right-of-way width may be expanded by up to 25 feet without Director approval to accommodate full construction right-of-way topsoil segregation and to ensure safe construction where topographic conditions (e.g., side-slopes) or soil limitations require it. Twenty-five feet of extra construction right-of-way width may also be used in limited, non-wetland or non-forested areas for truck turn-arounds where no reasonable alternative access exists.

   Project use of these additional limited areas is subject to landowner or land management agency approval and compliance with all applicable survey and permit requirements. When additional areas are used, each one shall be identified and the need explained in the weekly or biweekly construction reports to the FERC, if required. The following material shall be included in the reports:

   a. the location of each additional area by station number and reference to previously filed alignment sheets, or updated alignment sheets showing the additional areas;

   b. identification of the filing at FERC containing evidence that the additional areas were previously surveyed; and

c. a statement that landowner approval has been obtained and is available in project files.

Prior written approval of the Director is required when the authorized construction right-of-way width would be expanded by more than 25 feet.

B. TOPSOIL SEGREGATION

1. Unless the landowner or land management agency specifically approves otherwise, prevent the mixing of topsoil with subsoil by stripping topsoil from either the full work area or from the trench and subsoil storage area (ditch plus spoil side method) in:

   a. cultivated or rotated croplands, and managed pastures;

   b. residential areas;

   c. hayfields; and

   d. other areas at the landowner's or land managing agency's request.

2. In residential areas, importation of topsoil is an acceptable alternative to topsoil segregation.

3. Where topsoil segregation is required, the project sponsor must:

   a. segregate at least 12 inches of topsoil in deep soils (more than 12 inches of topsoil); and

   b. make every effort to segregate the entire topsoil layer in soils with less than 12 inches of topsoil.

4. Maintain separation of salvaged topsoil and subsoil throughout all construction activities.

5. Segregated topsoil may not be used for padding the pipe, constructing temporary slope breakers or trench plugs, improving or maintaining roads, or as a fill material.

6. Stabilize topsoil piles and minimize loss due to wind and water erosion with use of sediment barriers, mulch, temporary seeding, tackifiers, or functional equivalents, where necessary.

C. DRAIN TILES

1. Mark locations of drain tiles damaged during construction.

2. Probe all drainage tile systems within the area of disturbance to check for damage.

3. Repair damaged drain tiles to their original or better condition. Do not use filter-covered drain tiles unless the local soil conservation authorities and the landowner agree. Use qualified specialists for testing and repairs.

4. For new pipelines in areas where drain tiles exist or are planned, ensure that the depth of cover over the pipeline is sufficient to avoid interference with drain tile systems. For adjacent pipeline loops in agricultural areas, install the new pipeline with at least the same depth of cover as the existing pipeline(s).

D. IRRIGATION

Maintain water flow in crop irrigation systems, unless shutoff is coordinated with affected parties.

E. ROAD CROSSINGS AND ACCESS POINTS

1. Maintain safe and accessible conditions at all road crossings and access points during construction.

2. If crushed stone access pads are used in residential or agricultural areas, place the stone on synthetic fabric to facilitate removal.

3. Minimize the use of tracked equipment on public roadways. Remove any soil or gravel spilled or tracked onto roadways daily or more frequent as necessary to maintain safe road conditions. Repair any damages to roadway surfaces, shoulders, and bar ditches.

F. TEMPORARY EROSION CONTROL

Install temporary erosion controls immediately after initial disturbance of the soil. Temporary erosion controls must be properly maintained throughout construction (on a daily basis) and reinstalled as necessary (such as after backfilling of the trench) until replaced by permanent erosion controls or restoration is complete.

1. Temporary Slope Breakers

   a. Temporary slope breakers are intended to reduce runoff velocity and divert water off the construction right-of-way. Temporary slope

breakers may be constructed of materials such as soil, silt fence, staked hay or straw bales, or sand bags.

b. Install temporary slope breakers on all disturbed areas, as necessary to avoid excessive erosion. Temporary slope breakers must be installed on slopes greater than 5 percent where the base of the slope is less than 50 feet from waterbody, wetland, and road crossings at the following spacing (closer spacing shall be used if necessary):

Slope (%)	Spacing (feet)
5 - 15	300
>15 - 30	200
>30	100

c. Direct the outfall of each temporary slope breaker to a stable, well vegetated area or construct an energy-dissipating device at the end of the slope breaker and off the construction right-of-way.

d. Position the outfall of each temporary slope breaker to prevent sediment discharge into wetlands, waterbodies, or other sensitive environmental resource areas.

2. Temporary Trench Plugs

Temporary trench plugs are intended to segment a continuous open trench prior to backfill.

a. Temporary trench plugs may consist of unexcavated portions of the trench, compacted subsoil, sandbags, or some functional equivalent.

b. Position temporary trench plugs, as necessary, to reduce trenchline erosion and minimize the volume and velocity of trench water flow at the base of slopes.

3. Sediment Barriers

Sediment barriers are intended to stop the flow of sediments and to prevent the deposition of sediments beyond approved workspaces or into sensitive resources.

a. Sediment barriers may be constructed of materials such as silt fence, staked hay or straw bales, compacted earth (e.g., driveable berms across travelways), sand bags, or other appropriate materials.

b. At a minimum, install and maintain temporary sediment barriers across the entire construction right-of-way at the base of slopes greater than 5 percent where the base of the slope is less than 50 feet from a waterbody, wetland, or road crossing until revegetation is successful as defined in this Plan. Leave adequate room between the base of the slope and the sediment barrier to accommodate ponding of water and sediment deposition.

c. Where wetlands or waterbodies are adjacent to and downslope of construction work areas, install sediment barriers along the edge of these areas, as necessary to prevent sediment flow into the wetland or waterbody.

4. Mulch

a. Apply mulch on all slopes (except in cultivated cropland) concurrent with or immediately after seeding, where necessary to stabilize the soil surface and to reduce wind and water erosion. Spread mulch uniformly over the area to cover at least 75 percent of the ground surface at a rate of 2 tons/acre of straw or its equivalent, unless the local soil conservation authority, landowner, or land managing agency approves otherwise in writing.

b. Mulch can consist of weed-free straw or hay, wood fiber hydromulch, erosion control fabric, or some functional equivalent.

c. Mulch all disturbed upland areas (except cultivated cropland) before seeding if:

(1) final grading and installation of permanent erosion control measures will not be completed in an area within 20 days after the trench in that area is backfilled (10 days in residential areas), as required in section V.A.1; or

(2) construction or restoration activity is interrupted for extended periods, such as when seeding cannot be completed due to seeding period restrictions.

d. If mulching before seeding, increase mulch application on all slopes within 100 feet of waterbodies and wetlands to a rate of 3 tons/acre of straw or equivalent.

e. If wood chips are used as mulch, do not use more than 1 ton/acre and add the equivalent of 11 lbs/acre available nitrogen (at least 50 percent of which is slow release).

f. Ensure that mulch is adequately anchored to minimize loss due to wind and water.

g. When anchoring with liquid mulch binders, use rates recommended by the manufacturer. Do not use liquid mulch binders within 100 feet of wetlands or waterbodies, except where the product is certified environmentally non-toxic by the appropriate state or federal agency or independent standards-setting organization.

h. Do not use synthetic monofilament mesh/netted erosion control materials in areas designated as sensitive wildlife habitat, unless the product is specifically designed to minimize harm to wildlife. Anchor erosion control fabric with staples or other appropriate devices.

V. RESTORATION

A. CLEANUP

1. Commence cleanup operations immediately following backfill operations. Complete final grading, topsoil replacement, and installation of permanent erosion control structures within 20 days after backfilling the trench (10 days in residential areas). If seasonal or other weather conditions prevent compliance with these time frames, maintain temporary erosion controls (i.e., temporary slope breakers, sediment barriers, and mulch) until conditions allow completion of cleanup.

   If construction or restoration unexpectedly continues into the winter season when conditions could delay successful decompaction, topsoil replacement, or seeding until the following spring, file with the Secretary for the review and written approval of the Director, a winter construction plan (as specified in section III.I). This filing requirement does not apply to projects constructed under the automatic authorization provisions of the FERC's regulations.

2. A travel lane may be left open temporarily to allow access by construction traffic if the temporary erosion control structures are installed as specified in section IV.F. and inspected and maintained as specified in sections II.B.12 through 14. When access is no longer required the travel lane must be removed and the right-of-way restored.

3. Rock excavated from the trench may be used to backfill the trench only to the top of the existing bedrock profile. Rock that is not returned to the trench shall be considered construction debris, unless approved for use as mulch or for some other use on the construction work areas by the landowner or land managing agency.

4. Remove excess rock from at least the top 12 inches of soil in all cultivated or rotated cropland, managed pastures, hayfields, and residential areas, as well as other areas at the landowner's request. The size, density, and distribution of rock on the construction work area shall be similar to adjacent areas not disturbed by construction. The landowner or land management agency may approve other provisions in writing.

5. Grade the construction right-of-way to restore pre-construction contours and leave the soil in the proper condition for planting.

6. Remove construction debris from all construction work areas unless the landowner or land managing agency approves leaving materials onsite for beneficial reuse, stabilization, or habitat restoration.

7. Remove temporary sediment barriers when replaced by permanent erosion control measures or when revegetation is successful.

B. PERMANENT EROSION CONTROL DEVICES

1. Trench Breakers

a. Trench breakers are intended to slow the flow of subsurface water along the trench. Trench breakers may be constructed of materials such as sand bags or polyurethane foam. Do not use topsoil in trench breakers.

b. An engineer or similarly qualified professional shall determine the need for and spacing of trench breakers. Otherwise, trench breakers shall be installed at the same spacing as and upslope of permanent slope breakers.

c. In agricultural fields and residential areas where slope breakers are not typically required, install trench breakers at the same spacing as if permanent slope breakers were required.

d. At a minimum, install a trench breaker at the base of slopes greater than 5 percent where the base of the slope is less than 50 feet from a waterbody or wetland and where needed to avoid draining a waterbody or wetland. Install trench breakers at wetland boundaries, as specified in the Procedures. Do not install trench breakers within a wetland.

2. Permanent Slope Breakers

a. Permanent slope breakers are intended to reduce runoff velocity, divert water off the construction right-of-way, and prevent sediment deposition into sensitive resources. Permanent slope breakers may be constructed of materials such as soil, stone, or some functional equivalent.

b. Construct and maintain permanent slope breakers in all areas, except cultivated areas and lawns, unless requested by the landowner, using spacing recommendations obtained from the local soil conservation authority or land managing agency.

In the absence of written recommendations, use the following spacing unless closer spacing is necessary to avoid excessive erosion on the construction right-of-way:

Slope (%)	Spacing (feet)
5 - 15	300
>15 - 30	200
>30	100

c. Construct slope breakers to divert surface flow to a stable area without causing water to pool or erode behind the breaker. In the absence of a stable area, construct appropriate energy-dissipating devices at the end of the breaker.

d. Slope breakers may extend slightly (about 4 feet) beyond the edge of the construction right-of-way to effectively drain water off the disturbed area. Where slope breakers extend beyond the edge of the construction right-of-way, they are subject to compliance with all applicable survey requirements.

C. SOIL COMPACTION MITIGATION

1. Test topsoil and subsoil for compaction at regular intervals in agricultural and residential areas disturbed by construction activities. Conduct tests on the same soil type under similar moisture conditions in undisturbed areas to approximate preconstruction conditions. Use penetrometers or other appropriate devices to conduct tests.

2. Plow severely compacted agricultural areas with a paraplow or other deep tillage implement. In areas where topsoil has been segregated, plow the subsoil before replacing the segregated topsoil.

If subsequent construction and cleanup activities result in further compaction, conduct additional tilling.

3. Perform appropriate soil compaction mitigation in severely compacted residential areas.

D. REVEGETATION

1. General

a. The project sponsor is responsible for ensuring successful revegetation of soils disturbed by project-related activities, except as noted in section V.D.1.b.

b. Restore all turf, ornamental shrubs, and specialized landscaping in accordance with the landowner's request, or compensate the landowner. Restoration work must be performed by personnel familiar with local horticultural and turf establishment practices.

2. Soil Additives

Fertilize and add soil pH modifiers in accordance with written recommendations obtained from the local soil conservation authority, land management agencies, or landowner. Incorporate recommended soil pH modifier and fertilizer into the top 2 inches of soil as soon as practicable after application.

3. Seeding Requirements

a. Prepare a seedbed in disturbed areas to a depth of 3 to 4 inches using appropriate equipment to provide a firm seedbed. When hydroseeding, scarify the seedbed to facilitate lodging and germination of seed.

b. Seed disturbed areas in accordance with written recommendations for seed mixes, rates, and dates obtained from the local soil conservation authority or the request of the landowner or land management agency. Seeding is not required in cultivated croplands unless requested by the landowner.

c. Perform seeding of permanent vegetation within the recommended seeding dates. If seeding cannot be done within those dates, use appropriate temporary erosion control measures discussed in section IV.F and perform seeding of permanent vegetation at the beginning of the next recommended seeding season. Dormant seeding or temporary

seeding of annual species may also be used, if necessary, to establish cover, as approved by the Environmental Inspector. Lawns may be seeded on a schedule established with the landowner.

d. In the absence of written recommendations from the local soil conservation authorities, seed all disturbed soils within 6 working days of final grading, weather and soil conditions permitting, subject to the specifications in section V.D.3.a through V.D.3.c.

e. Base seeding rates on Pure Live Seed. Use seed within 12 months of seed testing.

f. Treat legume seed with an inoculant specific to the species using the manufacturer's recommended rate of inoculant appropriate for the seeding method (broadcast, drill, or hydro).

g. In the absence of written recommendations from the local soil conservation authorities, landowner, or land managing agency to the contrary, a seed drill equipped with a cultipacker is preferred for seed application.

Broadcast or hydroseeding can be used in lieu of drilling at double the recommended seeding rates. Where seed is broadcast, firm the seedbed with a cultipacker or roller after seeding. In rocky soils or where site conditions may limit the effectiveness of this equipment, other alternatives may be appropriate (e.g., use of a chain drag) to lightly cover seed after application, as approved by the Environmental Inspector.

VI. OFF-ROAD VEHICLE CONTROL

To each owner or manager of forested lands, offer to install and maintain measures to control unauthorized vehicle access to the right-of-way. These measures may include:

A. signs;

B. fences with locking gates;

C. slash and timber barriers, pipe barriers, or a line of boulders across the right-of-way; and

D. conifers or other appropriate trees or shrubs across the right-of-way.

VII. POST-CONSTRUCTION ACTIVITIES AND REPORTING

A. MONITORING AND MAINTENANCE

1. Conduct follow-up inspections of all disturbed areas, as necessary, to determine the success of revegetation and address landowner concerns. At a minimum, conduct inspections after the first and second growing seasons.

2. Revegetation in non-agricultural areas shall be considered successful if upon visual survey the density and cover of non-nuisance vegetation are similar in density and cover to adjacent undisturbed lands. In agricultural areas, revegetation shall be considered successful when upon visual survey, crop growth and vigor are similar to adjacent undisturbed portions of the same field, unless the easement agreement specifies otherwise.

   Continue revegetation efforts until revegetation is successful.

3. Monitor and correct problems with drainage and irrigation systems resulting from pipeline construction in agricultural areas until restoration is successful.

4. Restoration shall be considered successful if the right-of-way surface condition is similar to adjacent undisturbed lands, construction debris is removed (unless otherwise approved by the landowner or land managing agency per section V.A.6), revegetation is successful, and proper drainage has been restored.

5. Routine vegetation mowing or clearing over the full width of the permanent right-of-way in uplands shall not be done more frequently than every 3 years. However, to facilitate periodic corrosion/leak surveys, a corridor not exceeding 10 feet in width centered on the pipeline may be cleared at a frequency necessary to maintain the 10-foot corridor in an herbaceous state. In no case shall routine vegetation mowing or clearing occur during the migratory bird nesting season between April 15 and August 1 of any year unless specifically approved in writing by the responsible land management agency or the U.S. Fish and Wildlife Service.

6. Efforts to control unauthorized off-road vehicle use, in cooperation with the landowner, shall continue throughout the life of the project. Maintain signs, gates, and permanent access roads as necessary.

B. REPORTING

1. The project sponsor shall maintain records that identify by milepost:

   a. method of application, application rate, and type of fertilizer, pH modifying agent, seed, and mulch used;

   b. acreage treated;

   c. dates of backfilling and seeding;

   d. names of landowners requesting special seeding treatment and a description of the follow-up actions;

   e. the location of any subsurface drainage repairs or improvements made during restoration; and

   f. any problem areas and how they were addressed.

2. The project sponsor shall file with the Secretary quarterly activity reports documenting the results of follow-up inspections required by section VII.A.1; any problem areas, including those identified by the landowner; and corrective actions taken for at least 2 years following construction.

   The requirement to file quarterly activity reports with the Secretary does not apply to projects constructed under the automatic authorization, prior notice, or advanced notice provisions in the FERC's regulations.

WETLAND AND WATERBODY
CONSTRUCTION AND MITIGATION PROCEDURES (PROCEDURES)

I. APPLICABILITY

A. The intent of these Procedures is to assist project sponsors by identifying baseline mitigation measures for minimizing the extent and duration of project-related disturbance on wetlands and waterbodies. Project sponsors shall specify in their applications for a new FERC authorization, and in prior notice and advance notice filings, any individual measures in these Procedures they consider unnecessary, technically infeasible, or unsuitable due to local conditions and fully describe any alternative measures they would use. Project sponsors shall also explain how those alternative measures would achieve a comparable level of mitigation.

Once a project is authorized, project sponsors can request further changes as variances to the measures in these Procedures (or the applicant's approved procedures). The Director of the Office of Energy Projects (Director) will consider approval of variances upon the project sponsor's written request, if the Director agrees that a variance:

1. provides equal or better environmental protection;

2. is necessary because a portion of these Procedures is infeasible or unworkable based on project-specific conditions; or

3. is specifically required in writing by another federal, state, or Native American land management agency for the portion of the project on its land or under its jurisdiction.

Sponsors of projects planned for construction under the automatic authorization provisions in the FERC's regulations must receive written approval for any variances in advance of construction.

Project-related impacts on non-wetland areas are addressed in the staff's Upland Erosion Control, Revegetation, and Maintenance Plan (Plan).

B. DEFINITIONS

1. "Waterbody" includes any natural or artificial stream, river, or drainage with perceptible flow at the time of crossing, and other permanent waterbodies such as ponds and lakes:

   a. "minor waterbody" includes all waterbodies less than or equal to 10 feet wide at the water's edge at the time of crossing;

   b. "intermediate waterbody" includes all waterbodies greater than 10 feet wide but less than or equal to 100 feet wide at the water's edge at the time of crossing; and

   c. "major waterbody" includes all waterbodies greater than 100 feet wide at the water's edge at the time of crossing.

2. "Wetland" includes any area that is not in actively cultivated or rotated cropland and that satisfies the requirements of the current federal methodology for identifying and delineating wetlands.

II. PRECONSTRUCTION FILING

A. The following information must be filed with the Secretary of the FERC (Secretary) prior to the beginning of construction, for the review and written approval by the Director:

1. site-specific justifications for extra work areas that would be closer than 50 feet from a waterbody or wetland; and

2. site-specific justifications for the use of a construction right-of-way greater than 75-feet-wide in wetlands.

B. The following information must be filed with the Secretary prior to the beginning of construction. These filing requirements do not apply to projects constructed under the automatic authorization provisions in the FERC's regulations:

1. Spill Prevention and Response Procedures specified in section IV.A;

2. a schedule identifying when trenching or blasting will occur within each waterbody greater than 10 feet wide, within any designated coldwater fishery, and within any waterbody identified as habitat for federally-listed threatened or endangered species. The project sponsor will revise the schedule as necessary to provide FERC staff at least 14 days advance notice. Changes within this last 14-day period must provide for at least 48 hours advance notice;

3. plans for horizontal directional drills (HDD) under wetlands or waterbodies, specified in section V.B.6.d;

4. site-specific plans for major waterbody crossings, described in section V.B.9;

5. a wetland delineation report as described in section VI.A.1, if applicable; and

6. the hydrostatic testing information specified in section VII.B.3.

III. ENVIRONMENTAL INSPECTORS

A. At least one Environmental Inspector having knowledge of the wetland and waterbody conditions in the project area is required for each construction spread. The number and experience of Environmental Inspectors assigned to each construction spread shall be appropriate for the length of the construction spread and the number/significance of resources affected.

B. The Environmental Inspector's responsibilities are outlined in the Upland Erosion Control, Revegetation, and Maintenance Plan (Plan).

IV. PRECONSTRUCTION PLANNING

A. The project sponsor shall develop project-specific Spill Prevention and Response Procedures that meet applicable requirements of state and federal agencies. A copy must be filed with the Secretary prior to construction and made available in the field on each construction spread. This filing requirement does not apply to projects constructed under the automatic authorization provisions in the FERC's regulations.

1. It shall be the responsibility of the project sponsor and its contractors to structure their operations in a manner that reduces the risk of spills or the accidental exposure of fuels or hazardous materials to waterbodies or wetlands. The project sponsor and its contractors must, at a minimum, ensure that:

a. all employees handling fuels and other hazardous materials are properly trained;

b. all equipment is in good operating order and inspected on a regular basis;

c. fuel trucks transporting fuel to on-site equipment travel only on approved access roads;

d. all equipment is parked overnight and/or fueled at least 100 feet from a waterbody or in an upland area at least 100 feet from a wetland boundary. These activities can occur closer only if the Environmental Inspector determines that there is no reasonable alternative, and the

project sponsor and its contractors have taken appropriate steps (including secondary containment structures) to prevent spills and provide for prompt cleanup in the event of a spill;

e. hazardous materials, including chemicals, fuels, and lubricating oils, are not stored within 100 feet of a wetland, waterbody, or designated municipal watershed area, unless the location is designated for such use by an appropriate governmental authority. This applies to storage of these materials and does not apply to normal operation or use of equipment in these areas;

f. concrete coating activities are not performed within 100 feet of a wetland or waterbody boundary, unless the location is an existing industrial site designated for such use. These activities can occur closer only if the Environmental Inspector determines that there is no reasonable alternative, and the project sponsor and its contractors have taken appropriate steps (including secondary containment structures) to prevent spills and provide for prompt cleanup in the event of a spill;

g. pumps operating within 100 feet of a waterbody or wetland boundary utilize appropriate secondary containment systems to prevent spills; and

h. bulk storage of hazardous materials, including chemicals, fuels, and lubricating oils have appropriate secondary containment systems to prevent spills.

2. The project sponsor and its contractors must structure their operations in a manner that provides for the prompt and effective cleanup of spills of fuel and other hazardous materials. At a minimum, the project sponsor and its contractors must:

a. ensure that each construction crew (including cleanup crews) has on hand sufficient supplies of absorbent and barrier materials to allow the rapid containment and recovery of spilled materials and knows the procedure for reporting spills and unanticipated discoveries of contamination;

b. ensure that each construction crew has on hand sufficient tools and material to stop leaks;

c. know the contact names and telephone numbers for all local, state, and federal agencies (including, if necessary, the U. S. Coast Guard and the National Response Center) that must be notified of a spill; and

d. follow the requirements of those agencies in cleaning up the spill, in excavating and disposing of soils or other materials contaminated by a spill, and in collecting and disposing of waste generated during spill cleanup.

B. AGENCY COORDINATION

The project sponsor must coordinate with the appropriate local, state, and federal agencies as outlined in these Procedures and in the FERC's Orders.

V. WATERBODY CROSSINGS

A. NOTIFICATION PROCEDURES AND PERMITS

1. Apply to the U.S. Army Corps of Engineers (COE), or its delegated agency, for the appropriate wetland and waterbody crossing permits.

2. Provide written notification to authorities responsible for potable surface water supply intakes located within 3 miles downstream of the crossing at least 1 week before beginning work in the waterbody, or as otherwise specified by that authority.

3. Apply for state-issued waterbody crossing permits and obtain individual or generic section 401 water quality certification or waiver.

4. Notify appropriate federal and state authorities at least 48 hours before beginning trenching or blasting within the waterbody, or as specified in applicable permits.

B. INSTALLATION

1. Time Window for Construction

Unless expressly permitted or further restricted by the appropriate federal or state agency in writing on a site-specific basis, instream work, except that required to install or remove equipment bridges, must occur during the following time windows:

a. coldwater fisheries - June 1 through September 30; and

b. coolwater and warmwater fisheries - June 1 through November 30.

2. Extra Work Areas

a. Locate all extra work areas (such as staging areas and additional spoil storage areas) at least 50 feet away from water's edge, except where

the adjacent upland consists of cultivated or rotated cropland or other disturbed land.

b. The project sponsor shall file with the Secretary for review and written approval by the Director, site-specific justification for each extra work area with a less than 50-foot setback from the water's edge, except where the adjacent upland consists of cultivated or rotated cropland or other disturbed land. The justification must specify the conditions that will not permit a 50-foot setback and measures to ensure the waterbody is adequately protected.

c. Limit the size of extra work areas to the minimum needed to construct the waterbody crossing.

3. General Crossing Procedures

a. Comply with the COE, or its delegated agency, permit terms and conditions.

b. Construct crossings as close to perpendicular to the axis of the waterbody channel as engineering and routing conditions permit.

c. Where pipelines parallel a waterbody, maintain at least 15 feet of undisturbed vegetation between the waterbody (and any adjacent wetland) and the construction right-of-way, except where maintaining this offset will result in greater environmental impact.

d. Where waterbodies meander or have multiple channels, route the pipeline to minimize the number of waterbody crossings.

e. Maintain adequate waterbody flow rates to protect aquatic life, and prevent the interruption of existing downstream uses.

f. Waterbody buffers (e.g., extra work area setbacks, refueling restrictions) must be clearly marked in the field with signs and/or highly visible flagging until construction-related ground disturbing activities are complete.

g. Crossing of waterbodies when they are dry or frozen and not flowing may proceed using standard upland construction techniques in accordance with the Plan, provided that the Environmental Inspector verifies that water is unlikely to flow between initial disturbance and final stabilization of the feature. In the event of perceptible flow, the project sponsor must comply with all applicable Procedure requirements for "waterbodies" as defined in section I.B.1.

4. Spoil Pile Placement and Control

   a. All spoil from minor and intermediate waterbody crossings, and upland spoil from major waterbody crossings, must be placed in the construction right-of-way at least 10 feet from the water's edge or in additional extra work areas as described in section V.B.2.

   b. Use sediment barriers to prevent the flow of spoil or silt-laden water into any waterbody.

5. Equipment Bridges

   a. Only clearing equipment and equipment necessary for installation of equipment bridges may cross waterbodies prior to bridge installation. Limit the number of such crossings of each waterbody to one per piece of clearing equipment.

   b. Construct and maintain equipment bridges to allow unrestricted flow and to prevent soil from entering the waterbody. Examples of such bridges include:

      (1) equipment pads and culvert(s);
      (2) equipment pads or railroad car bridges without culverts;
      (3) clean rock fill and culvert(s); and
      (4) flexi-float or portable bridges.

      Additional options for equipment bridges may be utilized that achieve the performance objectives noted above. Do not use soil to construct or stabilize equipment bridges.

   c. Design and maintain each equipment bridge to withstand and pass the highest flow expected to occur while the bridge is in place. Align culverts to prevent bank erosion or streambed scour. If necessary, install energy dissipating devices downstream of the culverts.

   d. Design and maintain equipment bridges to prevent soil from entering the waterbody.

   e. Remove temporary equipment bridges as soon as practicable after permanent seeding.

   f. If there will be more than 1 month between final cleanup and the beginning of permanent seeding and reasonable alternative access to the right-of-way is available, remove temporary equipment bridges as soon as practicable after final cleanup.

g. Obtain any necessary approval from the COE, or the appropriate state agency for permanent bridges.

6. Dry-Ditch Crossing Methods

a. Unless approved otherwise by the appropriate federal or state agency, install the pipeline using one of the dry-ditch methods outlined below for crossings of waterbodies up to 30 feet wide (at the water's edge at the time of construction) that are state-designated as either coldwater or significant coolwater or warmwater fisheries, or federally-designated as critical habitat.

b. Dam and Pump

(1) The dam-and-pump method may be used without prior approval for crossings of waterbodies where pumps can adequately transfer streamflow volumes around the work area, and there are no concerns about sensitive species passage.

(2) Implementation of the dam-and-pump crossing method must meet the following performance criteria:

(i) use sufficient pumps, including on-site backup pumps, to maintain downstream flows;
(ii) construct dams with materials that prevent sediment and other pollutants from entering the waterbody (e.g., sandbags or clean gravel with plastic liner);
(iii) screen pump intakes to minimize entrainment of fish;
(iv) prevent streambed scour at pump discharge; and
(v) continuously monitor the dam and pumps to ensure proper operation throughout the waterbody crossing.

c. Flume Crossing

The flume crossing method requires implementation of the following steps:

(1) install flume pipe after blasting (if necessary), but before any trenching;

(2) use sand bag or sand bag and plastic sheeting diversion structure or equivalent to develop an effective seal and to divert stream flow through the flume pipe (some modifications to the stream bottom may be required to achieve an effective seal);

(3) properly align flume pipe(s) to prevent bank erosion and streambed scour;

(4) do not remove flume pipe during trenching, pipelaying, or backfilling activities, or initial streambed restoration efforts; and

(5) remove all flume pipes and dams that are not also part of the equipment bridge as soon as final cleanup of the stream bed and bank is complete.

d. Horizontal Directional Drill

For each waterbody or wetland that would be crossed using the HDD method, file with the Secretary for the review and written approval by the Director, a plan that includes:

(1) site-specific construction diagrams that show the location of mud pits, pipe assembly areas, and all areas to be disturbed or cleared for construction;

(2) justification that disturbed areas are limited to the minimum needed to construct the crossing;

(3) identification of any aboveground disturbance or clearing between the HDD entry and exit workspaces during construction;

(4) a description of how an inadvertent release of drilling mud would be contained and cleaned up; and

(5) a contingency plan for crossing the waterbody or wetland in the event the HDD is unsuccessful and how the abandoned drill hole would be sealed, if necessary.

The requirement to file HDD plans does not apply to projects constructed under the automatic authorization provisions in the FERC's regulations.

7. Crossings of Minor Waterbodies

Where a dry-ditch crossing is not required, minor waterbodies may be crossed using the open-cut crossing method, with the following restrictions:

a. except for blasting and other rock breaking measures, complete instream construction activities (including trenching, pipe installation, backfill, and restoration of the streambed contours) within 24 hours.

Streambanks and unconsolidated streambeds may require additional restoration after this period;

b. limit use of equipment operating in the waterbody to that needed to construct the crossing; and

c. equipment bridges are not required at minor waterbodies that do not have a state-designated fishery classification or protected status (e.g., agricultural or intermittent drainage ditches). However, if an equipment bridge is used it must be constructed as described in section V.B.5.

8. Crossings of Intermediate Waterbodies

Where a dry-ditch crossing is not required, intermediate waterbodies may be crossed using the open-cut crossing method, with the following restrictions:

a. complete instream construction activities (not including blasting and other rock breaking measures) within 48 hours, unless site-specific conditions make completion within 48 hours infeasible;

b. limit use of equipment operating in the waterbody to that needed to construct the crossing; and

c. all other construction equipment must cross on an equipment bridge as specified in section V.B.5.

9. Crossings of Major Waterbodies

Before construction, the project sponsor shall file with the Secretary for the review and written approval by the Director a detailed, site-specific construction plan and scaled drawings identifying all areas to be disturbed by construction for each major waterbody crossing (the scaled drawings are not required for any offshore portions of pipeline projects). This plan must be developed in consultation with the appropriate state and federal agencies and shall include extra work areas, spoil storage areas, sediment control structures, etc., as well as mitigation for navigational issues. The requirement to file major waterbody crossing plans does not apply to projects constructed under the automatic authorization provisions of the FERC's regulations.

The Environmental Inspector may adjust the final placement of the erosion and sediment control structures in the field to maximize effectiveness.

10. Temporary Erosion and Sediment Control

Install sediment barriers (as defined in section IV.F.3.a of the Plan) immediately after initial disturbance of the waterbody or adjacent upland.

Sediment barriers must be properly maintained throughout construction and reinstalled as necessary (such as after backfilling of the trench) until replaced by permanent erosion controls or restoration of adjacent upland areas is complete. Temporary erosion and sediment control measures are addressed in more detail in the Plan; however, the following specific measures must be implemented at stream crossings:

a. install sediment barriers across the entire construction right-of-way at all waterbody crossings, where necessary to prevent the flow of sediments into the waterbody. Removable sediment barriers (or driveable berms) must be installed across the travel lane. These removable sediment barriers can be removed during the construction day, but must be re-installed after construction has stopped for the day and/or when heavy precipitation is imminent;

b. where waterbodies are adjacent to the construction right-of-way and the right-of-way slopes toward the waterbody, install sediment barriers along the edge of the construction right-of-way as necessary to contain spoil within the construction right-of-way and prevent sediment flow into the waterbody; and

c. use temporary trench plugs at all waterbody crossings, as necessary, to prevent diversion of water into upland portions of the pipeline trench and to keep any accumulated trench water out of the waterbody.

11. Trench Dewatering

Dewater the trench (either on or off the construction right-of-way) in a manner that does not cause erosion and does not result in silt-laden water flowing into any waterbody. Remove the dewatering structures as soon as practicable after the completion of dewatering activities.

C. RESTORATION

1. Use clean gravel or native cobbles for the upper 1 foot of trench backfill in all waterbodies that contain coldwater fisheries.

2. For open-cut crossings, stabilize waterbody banks and install temporary sediment barriers within 24 hours of completing instream construction activities. For dry-ditch crossings, complete streambed and bank stabilization before returning flow to the waterbody channel.

3. Return all waterbody banks to preconstruction contours or to a stable angle of repose as approved by the Environmental Inspector.

4. Install erosion control fabric or a functional equivalent on waterbody banks at the time of final bank recontouring. Do not use synthetic monofilament

mesh/netted erosion control materials in areas designated as sensitive wildlife habitat unless the product is specifically designed to minimize harm to wildlife. Anchor erosion control fabric with staples or other appropriate devices.

5. Application of riprap for bank stabilization must comply with COE, or its delegated agency, permit terms and conditions.

6. Unless otherwise specified by state permit, limit the use of riprap to areas where flow conditions preclude effective vegetative stabilization techniques such as seeding and erosion control fabric.

7. Revegetate disturbed riparian areas with native species of conservation grasses, legumes, and woody species, similar in density to adjacent undisturbed lands.

8. Install a permanent slope breaker across the construction right-of-way at the base of slopes greater than 5 percent that are less than 50 feet from the waterbody, or as needed to prevent sediment transport into the waterbody. In addition, install sediment barriers as outlined in the Plan.

   In some areas, with the approval of the Environmental Inspector, an earthen berm may be suitable as a sediment barrier adjacent to the waterbody.

9. Sections V.C.3 through V.C.7 above also apply to those perennial or intermittent streams not flowing at the time of construction.

D. POST-CONSTRUCTION MAINTENANCE

1. Limit routine vegetation mowing or clearing adjacent to waterbodies to allow a riparian strip at least 25 feet wide, as measured from the waterbody's mean high water mark, to permanently revegetate with native plant species across the entire construction right-of-way. However, to facilitate periodic corrosion/leak surveys, a corridor centered on the pipeline and up to 10 feet wide may be cleared at a frequency necessary to maintain the 10-foot corridor in an herbaceous state. In addition, trees that are located within 15 feet of the pipeline that have roots that could compromise the integrity of the pipeline coating may be cut and removed from the permanent right-of-way. Do not conduct any routine vegetation mowing or clearing in riparian areas that are between HDD entry and exit points.

2. Do not use herbicides or pesticides in or within 100 feet of a waterbody except as allowed by the appropriate land management or state agency.

3. Time of year restrictions specified in section VII.A.5 of the Plan (April 15 – August 1 of any year) apply to routine mowing and clearing of riparian areas.

VI. WETLAND CROSSINGS

A. GENERAL

1. The project sponsor shall conduct a wetland delineation using the current federal methodology and file a wetland delineation report with the Secretary before construction. The requirement to file a wetland delineation report does not apply to projects constructed under the automatic authorization provisions in the FERC's regulations.

   This report shall identify:

   a. by milepost all wetlands that would be affected;

   b. the National Wetlands Inventory (NWI) classification for each wetland;

   c. the crossing length of each wetland in feet; and

   d. the area of permanent and temporary disturbance that would occur in each wetland by NWI classification type.

   The requirements outlined in this section do not apply to wetlands in actively cultivated or rotated cropland. Standard upland protective measures, including workspace and topsoiling requirements, apply to these agricultural wetlands.

2. Route the pipeline to avoid wetland areas to the maximum extent possible. If a wetland cannot be avoided or crossed by following an existing right-of-way, route the new pipeline in a manner that minimizes disturbance to wetlands. Where looping an existing pipeline, overlap the existing pipeline right-of-way with the new construction right-of-way. In addition, locate the loop line no more than 25 feet away from the existing pipeline unless site-specific constraints would adversely affect the stability of the existing pipeline.

3. Limit the width of the construction right-of-way to 75 feet or less. Prior written approval of the Director is required where topographic conditions or soil limitations require that the construction right-of-way width within the boundaries of a federally delineated wetland be expanded beyond 75 feet. Early in the planning process the project sponsor is encouraged to identify site-specific areas where excessively wide trenches could occur and/or where spoil piles could be difficult to maintain because existing soils lack adequate unconfined compressive strength.

4. Wetland boundaries and buffers must be clearly marked in the field with signs and/or highly visible flagging until construction-related ground disturbing activities are complete.

5. Implement the measures of sections V and VI in the event a waterbody crossing is located within or adjacent to a wetland crossing. If all measures of sections V and VI cannot be met, the project sponsor must file with the Secretary a site-specific crossing plan for review and written approval by the Director before construction. This crossing plan shall address at a minimum:

   a. spoil control;

   b. equipment bridges;

   c. restoration of waterbody banks and wetland hydrology;

   d. timing of the waterbody crossing;

   e. method of crossing; and

   f. size and location of all extra work areas.

6. Do not locate aboveground facilities in any wetland, except where the location of such facilities outside of wetlands would prohibit compliance with U.S. Department of Transportation regulations.

B. INSTALLATION

1. Extra Work Areas and Access Roads

   a. Locate all extra work areas (such as staging areas and additional spoil storage areas) at least 50 feet away from wetland boundaries, except where the adjacent upland consists of cultivated or rotated cropland or other disturbed land.

   b. The project sponsor shall file with the Secretary for review and written approval by the Director, site-specific justification for each extra work area with a less than 50-foot setback from wetland boundaries, except where adjacent upland consists of cultivated or rotated cropland or other disturbed land. The justification must specify the site-specific conditions that will not permit a 50-foot setback and measures to ensure the wetland is adequately protected.

   c. The construction right-of-way may be used for access when the wetland soil is firm enough to avoid rutting or the construction right-of-way has been appropriately stabilized to avoid rutting (e.g., with timber riprap, prefabricated equipment mats, or terra mats).

      In wetlands that cannot be appropriately stabilized, all construction equipment other than that needed to install the wetland crossing shall

use access roads located in upland areas. Where access roads in upland areas do not provide reasonable access, limit all other construction equipment to one pass through the wetland using the construction right-of-way.

d. The only access roads, other than the construction right-of-way, that can be used in wetlands are those existing roads that can be used with no modifications or improvements, other than routine repair, and no impact on the wetland.

2. Crossing Procedures

a. Comply with COE, or its delegated agency, permit terms and conditions.

b. Assemble the pipeline in an upland area unless the wetland is dry enough to adequately support skids and pipe.

c. Use "push-pull" or "float" techniques to place the pipe in the trench where water and other site conditions allow.

d. Minimize the length of time that topsoil is segregated and the trench is open. Do not trench the wetland until the pipeline is assembled and ready for lowering in.

e. Limit construction equipment operating in wetland areas to that needed to clear the construction right-of-way, dig the trench, fabricate and install the pipeline, backfill the trench, and restore the construction right-of-way.

f. Cut vegetation just above ground level, leaving existing root systems in place, and remove it from the wetland for disposal.

The project sponsor can burn woody debris in wetlands, if approved by the COE and in accordance with state and local regulations, ensuring that all remaining woody debris is removed for disposal.

g. Limit pulling of tree stumps and grading activities to directly over the trenchline. Do not grade or remove stumps or root systems from the rest of the construction right-of-way in wetlands unless the Chief Inspector and Environmental Inspector determine that safety-related construction constraints require grading or the removal of tree stumps from under the working side of the construction right-of-way.

h. Segregate the top 1 foot of topsoil from the area disturbed by trenching, except in areas where standing water is present or soils are

saturated. Immediately after backfilling is complete, restore the segregated topsoil to its original location.

i. Do not use rock, soil imported from outside the wetland, tree stumps, or brush riprap to support equipment on the construction right-of-way.

j. If standing water or saturated soils are present, or if construction equipment causes ruts or mixing of the topsoil and subsoil in wetlands, use low-ground-weight construction equipment, or operate normal equipment on timber riprap, prefabricated equipment mats, or terra mats.

k. Remove all project-related material used to support equipment on the construction right-of-way upon completion of construction.

3. Temporary Sediment Control

Install sediment barriers (as defined in section IV.F.3.a of the Plan) immediately after initial disturbance of the wetland or adjacent upland. Sediment barriers must be properly maintained throughout construction and reinstalled as necessary (such as after backfilling of the trench). Except as noted below in section VI.B.3.c, maintain sediment barriers until replaced by permanent erosion controls or restoration of adjacent upland areas is complete. Temporary erosion and sediment control measures are addressed in more detail in the Plan.

a. Install sediment barriers across the entire construction right-of-way immediately upslope of the wetland boundary at all wetland crossings where necessary to prevent sediment flow into the wetland.

b. Where wetlands are adjacent to the construction right-of-way and the right-of-way slopes toward the wetland, install sediment barriers along the edge of the construction right-of-way as necessary to contain spoil within the construction right-of-way and prevent sediment flow into the wetland.

c. Install sediment barriers along the edge of the construction right-of-way as necessary to contain spoil and sediment within the construction right-of-way through wetlands. Remove these sediment barriers during right-of-way cleanup.

4. Trench Dewatering

Dewater the trench (either on or off the construction right-of-way) in a manner that does not cause erosion and does not result in silt-laden water flowing into any wetland. Remove the dewatering structures as soon as practicable after the completion of dewatering activities.

C. RESTORATION

1. Where the pipeline trench may drain a wetland, construct trench breakers at the wetland boundaries and/or seal the trench bottom as necessary to maintain the original wetland hydrology.

2. Restore pre-construction wetland contours to maintain the original wetland hydrology.

3. For each wetland crossed, install a trench breaker at the base of slopes near the boundary between the wetland and adjacent upland areas. Install a permanent slope breaker across the construction right-of-way at the base of slopes greater than 5 percent where the base of the slope is less than 50 feet from the wetland, or as needed to prevent sediment transport into the wetland. In addition, install sediment barriers as outlined in the Plan. In some areas, with the approval of the Environmental Inspector, an earthen berm may be suitable as a sediment barrier adjacent to the wetland.

4. Do not use fertilizer, lime, or mulch unless required in writing by the appropriate federal or state agency.

5. Consult with the appropriate federal or state agencies to develop a project-specific wetland restoration plan. The restoration plan shall include measures for re-establishing herbaceous and/or woody species, controlling the invasion and spread of invasive species and noxious weeds (e.g., purple loosestrife and phragmites), and monitoring the success of the revegetation and weed control efforts. Provide this plan to the FERC staff upon request.

6. Until a project-specific wetland restoration plan is developed and/or implemented, temporarily revegetate the construction right-of-way with annual ryegrass at a rate of 40 pounds/acre (unless standing water is present).

7. Ensure that all disturbed areas successfully revegetate with wetland herbaceous and/or woody plant species.

8. Remove temporary sediment barriers located at the boundary between wetland and adjacent upland areas after revegetation and stabilization of adjacent upland areas are judged to be successful as specified in section VII.A.4 of the Plan.

D. POST-CONSTRUCTION MAINTENANCE AND REPORTING

1. Do not conduct routine vegetation mowing or clearing over the full width of the permanent right-of-way in wetlands. However, to facilitate periodic corrosion/leak surveys, a corridor centered on the pipeline and up to 10 feet wide may be cleared at a frequency necessary to maintain the 10-foot corridor in an herbaceous state. In addition, trees within 15 feet of the pipeline with roots that could compromise the integrity of pipeline coating may be selectively cut and removed from the permanent right-of-way. Do not conduct any routine vegetation mowing or clearing in wetlands that are between HDD entry and exit points.

2. Do not use herbicides or pesticides in or within 100 feet of a wetland, except as allowed by the appropriate federal or state agency.

3. Time of year restrictions specified in section VII.A.5 of the Plan (April 15 – August 1 of any year) apply to routine mowing and clearing of wetland areas.

4. Monitor and record the success of wetland revegetation annually until wetland revegetation is successful.

5. Wetland revegetation shall be considered successful if all of the following criteria are satisfied:

   a. the affected wetland satisfies the current federal definition for a wetland (i.e., soils, hydrology, and vegetation);

   b. vegetation is at least 80 percent of either the cover documented for the wetland prior to construction, or at least 80 percent of the cover in adjacent wetland areas that were not disturbed by construction;

   c. if natural rather than active revegetation was used, the plant species composition is consistent with early successional wetland plant communities in the affected ecoregion; and

   d. invasive species and noxious weeds are absent, unless they are abundant in adjacent areas that were not disturbed by construction.

6. Within 3 years after construction, file a report with the Secretary identifying the status of the wetland revegetation efforts and documenting success as defined in section VI.D.5, above. The requirement to file wetland restoration reports with the Secretary does not apply to projects constructed under the automatic authorization, prior notice, or advance notice provisions in the FERC's regulations.

   For any wetland where revegetation is not successful at the end of 3 years after construction, develop and implement (in consultation with a

professional wetland ecologist) a remedial revegetation plan to actively revegetate wetlands. Continue revegetation efforts and file a report annually documenting progress in these wetlands until wetland revegetation is successful.

VII. HYDROSTATIC TESTING

A. NOTIFICATION PROCEDURES AND PERMITS

1. Apply for state-issued water withdrawal permits, as required.

2. Apply for National Pollutant Discharge Elimination System (NPDES) or state-issued discharge permits, as required.

3. Notify appropriate state agencies of intent to use specific sources at least 48 hours before testing activities unless they waive this requirement in writing.

B. GENERAL

1. Perform 100 percent radiographic inspection of all pipeline section welds or hydrotest the pipeline sections, before installation under waterbodies or wetlands.

2. If pumps used for hydrostatic testing are within 100 feet of any waterbody or wetland, address secondary containment and refueling of these pumps in the project's Spill Prevention and Response Procedures.

3. The project sponsor shall file with the Secretary before construction a list identifying the location of all waterbodies proposed for use as a hydrostatic test water source or discharge location. This filing requirement does not apply to projects constructed under the automatic authorization provisions of the FERC's regulations.

C. INTAKE SOURCE AND RATE

1. Screen the intake hose to minimize the potential for entrainment of fish.

2. Do not use state-designated exceptional value waters, waterbodies which provide habitat for federally listed threatened or endangered species, or waterbodies designated as public water supplies, unless appropriate federal, state, and/or local permitting agencies grant written permission.

3. Maintain adequate flow rates to protect aquatic life, provide for all waterbody uses, and provide for downstream withdrawals of water by existing users.

4. Locate hydrostatic test manifolds outside wetlands and riparian areas to the maximum extent practicable.

D. DISCHARGE LOCATION, METHOD, AND RATE

1. Regulate discharge rate, use energy dissipation device(s), and install sediment barriers, as necessary, to prevent erosion, streambed scour, suspension of sediments, or excessive streamflow.

2. Do not discharge into state-designated exceptional value waters, waterbodies which provide habitat for federally listed threatened or endangered species, or waterbodies designated as public water supplies, unless appropriate federal, state, and local permitting agencies grant written permission.

WBI ENERGY TRANSMISSION, INC.
NORTH BAKKEN EXPANSION PROJECT

1.0 INTRODUCTION

This Spill Prevention, Control, and Countermeasure Plan (SPCC Plan) was prepared for WBI Energy Transmission, Inc.'s (WBI Energy) proposed North Bakken Expansion Project (Project) to be implemented during construction of the Project. This SPCC Plan outlines specific preventive measures and practices to reduce the likelihood of an accidental release of a hazardous or regulated liquid and, in the event such a release occurs, to expedite the response to and remediation of the release.

This SPCC Plan restricts the location of fuel storage, fueling activities, and construction equipment maintenance along the construction right-of-way and provides procedures for these activities. Training and lines of communication to facilitate the prevention, response, containment, and cleanup of spills during construction activities are also described.

All contractor personnel working on the Project are responsible for implementation of the measures and procedures defined in this SPCC Plan. Contractors are expected to meet or exceed WBI Energy's standards for spill response, reporting, and cleanup. Contractors whose activities could result in a spill of fuel or other regulated or hazardous materials on the right-of-way will adopt the measures identified in this SPCC Plan. All measures outlined in this SPCC Plan are consistent with the applicable requirements of the Federal Energy Regulatory Commission's *Wetland and Waterbody Construction and Mitigation Procedures*.

This SPCC Plan will be updated to include information specific to the horizontal directional drill crossing of Lake Sakakawea once a contractor has been selected for the Project. A complete copy of the SPCC Plan shall be maintained on site. A copy of the SPCC Plan will be available for a review during normal working hours. *[Note: An updated version of this plan will be filed with the Federal Energy Regulatory Commission and the U.S. Army Corps of Engineers as more detailed information is finalized.]*

1.1 TRAINING

Experienced, well-trained staff are essential for the successful implementation of the SPCC Plan. Contractors will provide spill prevention training as well as safety training to their work crews. The training program will be designed to improve awareness of safety requirements, pollution control laws, and proper operation and maintenance of equipment. Contractors will train all employees who handle fuels and other regulated substances to prevent spills and to quickly and effectively contain and clean up spills in accordance with applicable regulations and the provisions of this plan.

1.2 ROLES AND RESPONSIBILITIES

1.2.1 Spill Coordinator

Contractors will appoint a Spill Coordinator who will be responsible for coordinating Contractor Work Crews for spill cleanup, conducting site investigations, and assisting with completing spill reports. The Spill Coordinator will report all spills to an Environmental Inspector

(EI). The Spill Coordinator will be responsible for completing WBI Energy's internal Spill Report Form as soon as possible but no later than the end of the work day that the spill occurred, regardless of the size of the spill. The Spill Report Form will be submitted to the WBI Energy Designated Representative.

Spill Coordinator:	[To Be Determined Prior to Construction]
Phone Number:	[To Be Determined Prior to Construction]

1.2.2 Contractor Work Crews

Contractor Work Crews will comply with this SPCC Plan and will notify the Spill Coordinator immediately of any spill of fuel or other regulated or hazardous material, regardless of the volume of the spill. Contractor Work Crews will assist with the cleanup of the spill as directed by the Spill Coordinator, if trained to do so.

1.2.3 Environmental Inspectors

The EIs will monitor the Contractors' compliance with the provisions of the SPCC Plan to ensure that spill resources are allocated and cleanup accomplished in accordance with this plan and any applicable regulatory requirements. The EIs will work in conjunction with WBI Energy's Designated Representative to promptly report spills to appropriate federal, state, and local agencies, as required, and to coordinate with these agencies regarding contacting additional parties or agencies.

Environmental Inspector:	[To Be Determined Prior to Construction]
Phone Number:	[To Be Determined Prior to Construction]

1.2.4 WBI Energy's Designated Representative

The Designated Representative has the authority to commit resources to implement this SPCC Plan. The Designated Representative will work in conjunction with the EIs to promptly report spills to appropriate federal, state, and local agencies.

ALL SPILLS, REGARDLESS OF SIZE, MUST BE REPORTED TO THE SPILL COORDINATOR AND ENVIRONMENTAL INSPECTORS

2.0 PREVENTATIVE MEASURES

Contractors will minimize the potential for a spill during construction activities at WBI Energy's facilities and on its right-of-way by implementing appropriate measures to prevent and contain spills. Equipment and materials will be located on site to meet the provisions of this SPCC Plan. The Contractor shall supply each construction crew with a quantity of absorbent and barrier materials sufficient to contain and recover spills that could potentially occur from the equipment with the largest on-board volume of fuel and lubricant. These materials may include, but are not limited to, drip pans, buckets, absorbent pads, containment booms, straw bales, absorbent clay, saw dust, floor drying agents, spill containment barriers, plastic sheeting, skimmer pumps, covered holding tanks, and fire extinguishers.

The Contractor shall make known to all construction personnel the locations of staging areas where spill response equipment and materials are stored, and have them readily accessible during construction. Contractors will comply with applicable environmental and safety laws and regulations and will ensure that a copy of this plan is available on site to all Construction Work Crew members.

In addition, periodic discussions between construction personnel and their supervisors must be held. These are conversations where problems in field operations are discussed and solved. This SPCC Plan, together with specific techniques, will be reviewed with the appropriate employees at a safety meeting before construction starts.

The contractor will provide, maintain, and make available the appropriate Safety Data Sheets for vehicle and equipment fuel, lubricating oil, and any other regulated or hazardous materials utilized for the Project.

The following sections describe spill prevention measures to be taken on Project locations.

2.1 PETROLEUM AND HAZARDOUS LIQUID STORAGE, REFUELING, AND EQUIPMENT MAINTENANCE

2.1.1 Staging Areas and Facility Sites:

- Contractors will construct temporary liners and seamless impermeable berms, or other appropriate containment, around aboveground storage containers so that liquids will be contained and collected in specified areas isolated from waterbodies in the event of a leak or spill. Storage containers will not be placed in areas subject to periodic flooding and washout.

- Contractors will visually inspect aboveground storage containers for leaks and spills frequently and whenever containers are refilled.

- Secondary containment structures must provide a containment volume equal to a minimum of 110 percent of the maximum storage volume of the largest storage container in the containment structure.

- Secondary containment structures must be constructed so that no outlet is provided and any spill will be contained within the containment structure. Accumulated rainwater may be removed if authorized by an EI. Accumulated water with a visible sheen will be collected for proper storage, transport and disposal.

- Contractors will remove all secondary containment structures at the conclusion of the Project. Contractors also will be responsible for returning any storage impoundment areas to original contours and appearance upon completion of the Project.

- Fuels and lubricants will be stored only at designated staging areas and in appropriate service vehicles. The storage areas will be located at least 100 feet away from edges of wetlands and waterbodies, at least 100 feet away from

designated municipal watershed areas, at least 200 feet away from private water supply wells, and at least 400 feet away from municipal water-supply wells unless a larger buffer is required by regulatory agencies.

- Storage containers will display labels that identify the contents of the container and whether the contents are hazardous. Contractors will maintain and provide to WBI Energy, when requested, copies of all Safety Data Sheets.

- Contractors will conduct routine equipment maintenance such as oil changes in staging areas, or as necessary in additional temporary workspace, and will dispose of waste oil in an appropriate manner (e.g. the Contractors will collect the waste oil in labeled, sealed containers and transport the waste oil to a recycling facility).

- Contractors will correct visible leaks in storage containers as soon as possible. Leaks outside of secondary containment, regardless of volume, will be reported to an EI.

- All fuel nozzles will be equipped with functional automatic shut-off valves.

- The drivers of tank trucks will be responsible for spill prevention and secondary containment during loading and unloading operations. Procedures for loading and unloading tank trucks will meet the minimum requirements established by applicable regulations. Drivers will observe and control the fueling operations at all times to prevent overfilling. Contractors will be responsible for training drivers of tank trucks to comply with these provisions.

- Prior to departure of any tank truck, all outlets of the vehicle will be closely examined by the driver for leakage and tightened, adjusted, or replaced, as necessary, to prevent liquid leakage while in transit. Contractors will be responsible for training drivers of tank trucks to comply with these provisions.

2.1.2 Project Right-of-Way

- All machinery will arrive on the right-of-way in a clean, washed condition, and free of fluid leaks.

- Contractors will wash, refuel, and service machinery at locations well away from any wetlands and waterbodies to prevent petroleum or chemical substances from entering surface waters.

- Overnight parking of equipment, as well as refueling and lubricating of construction equipment, will be restricted to upland areas at least 100 feet away from stream channels and wetlands, at least 200 feet from private water-supply wells, and at least 400 feet from municipal water-supply wells. Where this is not possible, and where an EI finds in advance no reasonable alternative, the equipment will be fueled by designated personnel with specific training in refueling, spill containment, and cleanup, under the supervision of an EI. Prior to refueling, appropriate steps will be taken (including deployment of secondary containment structures) to prevent spills and provide for prompt cleanup in the event of a spill.

- Fuel trucks transporting fuels to construction areas will only travel on approved access roads.

- Contractors will keep a spill kit on site in case of machinery leaks or spills.

2.1.3 Restricted Refueling Areas

Restricted refueling areas include areas where the appropriate buffer (e.g., 100 feet from a wetland or waterbody) cannot be maintained. All restricted refueling areas will be identified in the field with flagging or signs. A site-specific plan and written approval from an EI will be required to refuel in restricted areas.

- Approval must be received from an EI and, where necessary, appropriate regulatory permits must be obtained, prior to refueling in restricted refueling areas.

- In large wetlands where no upland site is available for refueling, auxiliary fuel tanks may be mounted to equipment to minimize the need for refueling.

- Trained personnel must be available for refueling, and an EI must be present unless a case-specific exemption is obtained in writing from WBI Energy's Designated Representative.

- Equipment such as large, stationary pumps will be fitted with auxiliary tanks as appropriate. The auxiliary tanks will be placed within secondary containment which provides for a containment volume equal to a minimum of 110 percent of the volume of the largest tank in the containment structure.

- Refueling within restricted refueling areas will take place only in areas designated by an EI. Fuel trucks with a capacity in excess of 300 gallons will not be allowed within a restricted refueling area unless adequate secondary containment is provided.

- Refueling of dewatering pumps, generators, and other small, portable equipment will be performed using approved containers with a maximum volume of 5 gallons.

- Fuel trucks will be prohibited from traveling on temporary equipment bridges at stream crossings. An EI may waive this restriction on a site-specific basis if a reasonable refueling option is not available. Such case-specific exemptions must be approved in writing by WBI Energy's Designated Representative.

2.2 SPILL RESPONSE EQUIPMENT

2.2.1 Staging Areas and Facility Sites

- Contractors will stock a sufficient supply of sorbent and barrier materials at construction staging areas to allow the rapid containment and recovery of spilled material. Sorbent and barrier materials will also be used to contain runoff from spill areas.

- Shovels and labeled drums will be kept at each of the individual staging areas. If small quantities of soil become contaminated within the staging area, they will be collected and placed in the drums. Large quantities of contaminated soil will be collected using heavy equipment and will be stored in drums, lined bermed areas, or other suitable containment, prior to disposal. The Contractors will dispose of all contaminated soil in accordance with applicable state and federal regulations.

2.2.2 Project Right-of-Way

- Each construction crew must have adequate absorbent materials and containment booms on hand to enable the rapid and complete cleanup of spills, as well as sufficient tools and materials to stop leaks.

- Contractors must maintain spill kits containing a sufficient quantity of absorbent and barrier materials to adequately contain and recover foreseeable spills. These kits may include, but are not limited to, absorbent pads, straw bales, absorbent clay, saw dust, floor drying agents, spill containment barriers, plastic sheeting, skimmer pumps, and drums. The equipment will be located near fuel storage areas and other locations as necessary to be readily available in the event of a spill.

- All fuel, and where possible, service trucks, will carry adequate spill response materials. Spill response materials present on trucks should consist of absorbent pads, absorbent material, plastic bags, and a shovel.

- The Spill Coordinator will inform an EI, and all Contractor personnel of the location of spill control equipment and materials, and have them readily accessible while construction activities are occurring.

2.3 CONCRETE COATING

Concrete coating activities will not be performed within 100 feet of a wetland or waterbody unless the location is an existing industrial site designated for such use.

3.0 STORAGE, CONTAINMENT AND FACILITY TRANSFER

All chemical storage containers, tanks, or barrels will be made of compatible materials with the appropriate temperature and pressure rating, overpressure protection, valving, and equalization lines necessary to comply with the appropriate state and federal regulations regarding storage of regulated substances. All chemicals, regardless of container size, will be stored in secondary containment or designated storage areas when not actively in use.

Fuel valves used for the final control of flow shall be of the self-closing type and shall be manually held open except were automatic means are provided for shutting off the flow when the vehicle is full.

Contaminated liquids inside containment areas will not be allowed to be drained outside the containment structures onto the ground or into any open water course. These liquids will be pumped or wiped out of containment structures and disposed of appropriately.

4.0 SPILL RESPONSE

Any employee who detects a spill incident while it is occurring should take the necessary measures to stop the flow but only if that employee has been trained to do so. If the employee is unprepared to effectively control the spill, caution and good judgment should be used as to personal safety until a cleanup crew arrives. Immediate containment by the discovering person can reduce the extent of the spill damage.

4.1 FIRST PRIORITIES

The first priorities after discovering a spill are to protect the safety of personnel and the public, minimize damage to the environment, and control costs associated with cleanup and reclamation. Actions to be taken immediately following a spill include the following:

1. Assess the safety of the situation (including the surrounding public).
2. Sources of ignition will be removed from the area, **if safe to do so**.
3. The source of the spill will be shut off, **if safe to do so**.
4. Efforts to contain the spill immediately will be initiated, **if safe to do so**.

Cleanup activities will be initiated as soon as possible after the spill is contained using properly trained and protected personnel with adequate spill cleanup materials and equipment.

5.0 SPILL REPORTING

All spills will be reported immediately to the Spill Coordinator who will in turn work with an EI and WBI Energy's Designated Representative to address and report the spill as necessary. The Spill Coordinator will record at a minimum the following information (found on the Spill Report Form in appendix A):

1. Date, time, and location of the spill.
2. Type of material spilled.
3. Amount of material spilled.
4. Extent of spill area.
5. Whether the material has reached or has the potential to reach a waterbody.
6. Status of spill containment and cleanup.
7. Circumstances leading up to the spill.

WBI Energy's Designated Representative will report the spill to the appropriate regulatory agencies if the spill meets or exceeds a reportable threshold. Appropriate agencies include, but may not be limited to, the following:

1. North Dakota Department of Health at 1-701-328-5210 for non-emergencies or North Dakota Department of Emergency Services at 1-800-472-2121 (24 hour hotline) for emergencies. The North Dakota Department of Health also requires completion of an online "General Environmental Incident" form available at http://www.ndhealth.gov/ehs/eir/eirform.htm for any spill of any volume.

2. National Spill Response Center (Washington D.C.) at 1-800-424-8802 (24 hours).

3. U.S. Army Corp of Engineers – Jeremy Thury (701-654-7761) and Reece Nelson (402-995-2505) for any spills occurring on U.S. Army Corp of Engineers owned land.

4. U.S. Forest Service Little Missouri National Grasslands– McKenzie Ranger District (701-842-8500) Cale Bickerdyke or Kim Grotte for any spills occurring on U.S Forest Service owned land.

Contractors are responsible for assisting WBI Energy with preparing follow-up written incident reports to regulatory agencies upon request and with accommodating any inspections performed by regulatory agencies.

WBI Energy's internal Spill Report Form will be completed by the Spill Coordinator and provided to WBI Energy's Designated Representative as soon as possible but no later than the end of the day on the day the spill event occurred so agencies can be notified in a timely manner and pertinent information is available for reporting. State and federal agencies must be notified within 24 hours of a reportable spill event. Field personnel will report the spill to the state and federal agencies only if the WBI Energy's Designated Representative is unavailable to do so. All Spill Report Forms and other reporting documentation will be kept on file by WBI Energy's Designated Representative.

6.0 SPILL CONTROL AND CLEANUP

Spill control should only be done by employees trained and prepared to effectively control the spill. Good judgment should be made by employees as to their personal role in the containment actions; however, prompt action can often prevent extensive spill damage. Employees engaged in spill control will use the proper precautions and safety equipment as specified in the Safety Data Sheet(s). The Designated Representative and EI will devise a cleanup plan, as necessary, based on location, quantity, and type of substance spilled.

Upon learning of the spill, the Spill Coordinator will implement the measures in the following sections.

6.1 LAND SPILL

- As necessary, berms will be constructed with available equipment to physically contain the spill and sorbent materials will be applied to the spill area. Traffic on contaminated soils will be minimized.

- Contaminated soils and vegetation will be removed and disposed of at a licensed waste disposal facility.

- Waste materials from the spill will be disposed of according to state and federal regulatory requirements.

- The following information will be provided to the EI and the WBI Energy Designated Representative:

    - The amount of spilled material that was recovered during cleanup.

- Proposed reclamation of remaining contaminated areas.
- Storage method for the contaminated waste material before transport and disposal.
- Transport and disposal documentation for the contaminated waste material.

6.2 WETLAND AND WATERBODY SPILL

Regardless of size, the following conditions apply if a spill occurs near or into a stream, wetland, or an open surface water source.

- For spills in standing water, floating booms, skimmer pumps, and holding tanks shall be used as appropriate by the contractor to recover and contain released materials on the surface of the water.
- For a spill threatening a waterbody, berms and/or trenches will be constructed to contain the spill before it reaches the waterbody. Deployment of booms, sorbent materials, and skimmers may be necessary if the spill reaches the water. The spilled product will be collected and the affected area cleaned up in accordance with appropriate state or federal regulations.
- Contaminated soils in wetlands must be excavated from the wetland. The soils must be placed on and covered by plastic sheeting in approved containment areas a minimum of 100 feet away from wetlands or waterbodies. Contaminated soil will be disposed of as soon as possible in accordance with appropriate state or federal regulations.

All cleanup activities will be conducted according to this SPCC Plan. Personnel involved in cleanup activities will meet the minimum requirements for hazardous materials training and will use approved Occupational Safety and Health Administration safety equipment.

WBI Energy's contractor responsible for the HDD has also developed an activity-specific SPCC plan for the HDD of Lake Sakakawea. In event of a spill or inadvertent release of drilling fluid during the HDD crossing of Lake Sakakawea, the SPCC plan included as Appendix B will be implemented.

I. Introduction

This Spill Prevention Control and Countermeasure Plans (SPCC) have been developed by Michels Corporation (Michels) to serve as a guideline for horizontal directional drilling (HDD) operations. This plan is intended to ensure that the equipment utilized to perform the work and the fuel, oil, and lubricant products used in the day to day operation of the equipment will have no long-term adverse environmental impact on the staging areas required for construction. The guidelines contained in this plan will be implemented by field personnel to prevent accidental releases of hazardous material to the environment and to outline measures taken should an accidental release occur. The drilling project manager for the project is experienced in these matters and is typically the designated Spill Coordinator for Michels.

This SPCC plan was developed using Federal Energy Regulatory Commission (FERC) guidelines for construction activities along a pipeline right-of-way. This plan is intended to comply with all applicable requirements of FERC and local State and County authorities. Since HDD operations are generally confined to two distinct locations, the rig (entry) side and pipe (exit) side, this SPCC plan addresses construction operations at these specific locations only for hazardous materials. This SPCC plan consists of three sections:

- Preventative measures to be taken prior to initiating construction with hazardous materials;
- Preventative procedures to be followed while using hazardous materials during construction;
- Procedures to be implemented should an accidental spill of hazardous material occur;

II. Pre-Construction Hazardous Material Spill Prevention

Prior to construction, all Michels' personnel who will be performing work on site will have attended a FERC-approved environmental training program within the last year. This training program will serve to indoctrinate the personnel and make them aware of the pollution control laws, rules, and regulations applicable to the pipeline right-of-ways. Michels' personnel are highly experienced with the equipment to be used in HDD operations and have worked on numerous FERC governed projects in the past. However all personnel will be refreshed by the project manager and drill superintendent in the operation and maintenance of construction equipment to prevent the accidental discharge or spill of fuel, oil, or lubricants.

Through the environmental training program and the project manager's guidance along with knowledge obtained from past experience, all Michels' personnel will be thoroughly educated on the following topics:

© Copyright, Michels Directional Crossings, a Division of Michels Corporation, 2020

- Precautionary measures to prevent spills;
- Potential sources of spills, such as equipment failure or malfunction and re-fueling procedures;
- Standard operating procedures in case of a spill, including applicable notification requirements;
- Equipment, Materials, and Supplies available for clean-up of a spill;
- Review of known spill events, if any.

Prior to mobilizing equipment to the proposed alignment R.O.W., Michels will thoroughly inspect and if necessary repair or replace equipment components that could potentially leak hazardous material. The equipment will be cleaned of any debris or material observed to be hazardous. All hazardous material storage containers and secondary containment devices will be inspected and if necessary repaired or replaced.

The spill containment and clean-up materials used by Michels will be inventoried and if necessary re-stocked prior to initiating construction operations. At a minimum, the following spill containment and clean-up materials will be located in a central location at each side of the HDD crossings where equipment is in use or hazardous materials are stored in sufficient quantities to contain and clean-up a spill or release should one occur:

- Spill containment kits typically consisting of the following items
  - 1 x 55 gal poly drum
  - 50 x 18” x 18” absorbent pads
  - 8 x 3” x 4’ absorbent socks
  - 6 x 18” x 18” absorbent pillows
  - 3 x 5” x 10’ absorbent booms
  - 4 Disposable plastic bags with ties
  - 4 pair nitrile gloves
- Plastic sheeting
- Floor Dry absorbent material (50 pound bag-typical)
- Personal protective equipment (i.e. gloves and safety glasses)
- Replacement parts and equipment for repair of tanks, hoses, nozzles, etc.
- Equipment and tools to divert spilled fluids and create earthen barriers

III. HDD Construction Operations Hazardous Material Spill Prevention

Once construction activities for the HDD are underway, hazardous material spill prevention will be a continuous element of the operations. During equipment set up, potential sources of hazardous material releases, i.e. fuel tanks, hydraulic oil tanks and hoses, antifreeze tanks, and lubricant storage bins will be located as far away as practicably possible from streams, wetlands, and drainage ways. If necessary, and if practicable, temporary barriers may be constructed or placed between the potential sources of spills and areas identified as extremely sensitive to accidental

© Copyright, Michels Directional Crossings, a Division of Michels Corporation, 2020

spills. Spill containment and clean-up materials/kits will be located in a central location at each side of the drill site location where equipment is in operation or hazardous materials are stored and all personnel will be made aware of the location.

Secondary containment devices will be placed to enclose major sources of potential hazardous spill locations (i.e. fuel storage tanks and hazardous materials storage areas). A site layout drawing for entry locations and exit locations showing the placement of significant sources of hazardous material releases and secondary containment measures are attached in **Appendix A** of this plan. The exact location of the equipment will vary to address specific site conditions after the temporary work space has been prepared for equipment set-up. Access to the sites will be limited by the Project Manager to only authorized personnel and visitors.

During construction, spill refresher briefings will be scheduled quarterly and conducted by Michels. The briefings will refresh Michels' personnel on the topics covered during the pre-construction environmental training as well as review operations to date, including any accidental spills that may have occurred and measures taken for prevention of future spills.

Michels will store, handle and transfer hazardous materials used during HDD operations in a manner to prevent accidental releases or spills of these materials. **Table-1** attached in **Appendix-A** to this plan summarizes the hazardous materials, combined expected volumes, and storage methods for both the entry and exit locations. The Material Safety Data Sheets (MSDS) for every product used by Michels are maintained on file in the drilling survey trailer on site should they be required to assess the hazard potential of a spill. The list of primary hazardous materials (petroleum-based products) to be used by Michels over the course of each HDD crossing is as follows:

- Gasoline
- Diesel Fuel
- Hydraulic Oil
- Lubricants
- Penetrating Oils
- Antifreeze

Michels' personnel will follow specific guidelines set forth in this plan during operation and maintenance of equipment and vehicles used in support of the HDD operations. All waste oil or fuel collected during routine maintenance of the equipment will be contained and disposed of in accordance with state and federal requirements.

© Copyright, Michels Directional Crossings, a Division of Michels Corporation, 2020

IV. Potential Sources of Hazardous Spill-Preventative Measures to be Implemented

For day to day operations, Michels' personnel will follow these guidelines to prevent the accidental release or spill of hazardous materials:

Potential Source of Hazardous Spill	Preventative Measures To be Implemented
Fuel stored in a storage tank	• Except as specified in **Attachment-A** of Appendix-B, locate storage tank at least 100 feet from wetlands or surface waters, at least 200 feet from private water supplies, and at least 400 feet from public water supplies. • Install secondary containment devices around tank in excess of 150% of the maximum volume to be stored. • Inspect tank and secondary containment daily and before filling, implement corrective action upon discovery of deterioration that could cause a spill or result in a leak. Record inspection results weekly on log attached in the appendix to this plan. • Remove any precipitation found within the secondary containment. Prior to removing the precipitation, inspect for film, sheen, discoloration, sludge, emulsion or tarry residue, if present then collect the liquid for disposal. Do not discharge to land or surface waters. • Plug or close all tank openings when not in use. • Maintain sufficient quantities of spill control and clean-up materials in a central location near the storage tank, inspect supply daily. • Provide security measures to protect against vandalism of stored materials
Liquid material stored in a container	• Except as specified in **Attachment-A** of Appendix-B, store container at least 100 feet from wetlands or surface waters, at least 200 feet from private water supplies, and at least 400 feet from public water supplies. • If practicable and if room allows, store containers in a central location within a common secondary containment device. All significant container storage (i.e. greater than 5 gallon) will have secondary containment in excess of 150% of the maximum volume proposed to be stored. • Use small containers which are in good condition (maximum 55 gallon drum). • Take measures to protect the containers from the elements or physical damage. • Inspect containers daily, replace immediately if damaged or leaking. Record inspection results weekly on log attached in **Attachment-B** of Appendix-B to this plan • Close containers when not in use. • Maintain sufficient quantities of spill control and clean-up materials in a central location where the containers are regularly used, inspect supply daily. • Provide security measures to protect against vandalism of stored materials

© Copyright, Michels Directional Crossings, a Division of Michels Corporation, 2020

Liquid material transferred from a storage tank or container to vehicles or equipment	• Except as specified in **Attachment-A** of Appendix-B**,** transfer materials at least 100 feet from wetlands or surface waters, at least 200 feet from private water supplies, and at least 400 feet from public water supplies. Exercise extreme caution for transfers in areas where set-back distances from sensitive areas cannot be met such as placement of absorbent pads or drip pans beneath transfer points, creating temporary earthen berms, or other similar precautionary spill measures. • Transfer during daylight hours or where lighting is adequate to illuminate the area. • Monitor transfer operations at all times. • Maintain sufficient quantities of spill control and clean-up materials in a central location where transfers regularly occur, inspect supply daily. • Provide security measures to protect against vandalism of stored materials

© Copyright, Michels Directional Crossings, a Division of Michels Corporation, 2020

Liquid material used in vehicles and equipment	• Except as specified in **Attachment-A** of Appendix-B, park at least 100 feet from wetlands or surface waters, at least 200 feet from private water supplies, and at least 400 feet from public water supplies. • Inspect daily for leaks or signs of deterioration that could result in a leak. • Repair or replace defective tanks, hoses, fittings, etc. • Maintain sufficient quantities of spill control and clean-up materials in a central location where equipment or vehicles are in use, inspect supply daily. • Provide security measures to protect against vandalism of stored materials

© Copyright, Michels Directional Crossings, a Division of Michels Corporation, 2020

Liquid material transferred from tank vehicle to vehicles & equipment	• Except as specified in **Attachment A** of Appendix-B, tank vehicle used during re-fueling operations shall be specifically designed for supplying fuel to vehicle or equipment tanks and will comply with the requirements of NFPA 385 and other applicable state and federal requirements. • Tank vehicle and its equipment shall be maintained in good repair. • Drivers to be thoroughly trained in the proper method and operation of tank vehicles and in acceptable unloading procedures. • The driver or operator will not leave vehicle unattended during re-fueling operations • All engines to be shut off and operators not on the equipment during refueling operations. • Smoking is to be forbidden on or near any vehicle involved in re-fueling operations. Extreme precaution shall be exercised to prevent people in the vicinity from smoking, lighting matches, or carrying any flame or lighted device. Signs prohibiting smoking or open flames to be prominently displayed in open view on the tank vehicle. • Re-fueling procedures will not be initiated until precautions have been taken to prevent the motion of vehicles involved. Parking brakes to be utilized if available. • Length of refueling hose is typically limited to 50-feet from the hose reel. Tank vehicle to be positioned with respect to vehicles being fueled in order to prevent unwanted traffic between the tank vehicle and vehicle/equipment being fueled. • Each vehicle must contain one portable fire extinguisher that has a minimum rating of 4A, or 4-B,C. Ratings to be in accordance with NFPA-10. Signage on vehicles shall clearly indicate location of fire extinguisher. • Fueling/Re-fueling operations should typically take place during daylight hours. Nighttime fueling operations conducted in adequately lighted areas. • Documentation of training to be made available upon request. • Provide security measures to protect against vandalism of stored materials

Should these guidelines prove to be inadequate to prevent the accidental release or spill of hazardous material, they will be revised and implemented as required to ensure that every possible preventative effort is being taken. All personnel will be made aware of any such revisions at the time of the revision and at the environmental refresher meetings.

V. HDD Construction Operations Hazardous Material Spill Procedures

A spill is an unintentional release of hazardous material to the environment. In the unlikely event that an inadvertent spill of a hazardous material occurs the following steps will be followed at a minimum:

- Step 1 - Containment: Assess the situation prior to attempting to control the spill. Secure the spill scene and attempt to identify and stop the source of spill and

© Copyright, Michels Directional Crossings, a Division of Michels Corporation, 2020

contain at source. Limit access to the site in order to prevent/limit personal and/or property damage. Responders must have knowledge of the spilled material and immediately utilize all available resources (i.e. equipment, personnel, and materials), to contain spill. If adequate resources are not available, expedite mobilization of additional resources from other construction activities as required to fully contain the spill. If the spill cannot be adequately handled by additional resources, Michels will arrange for an approved spill response contractor to mobilize to the site and contain, clean up, and perform required sampling and disposal of spilled materials and residual contaminated debris.

- Step 2 - Remediation: Properly trained personnel shall clean up hazardous material immediately after spill is contained to prevent further migration of hazardous materials into the environment. Responders should consult with proper governmental resource agencies as required. In no case shall containment equipment be used to permanently store contaminated material. Containerize in DOT-approved containers, label, and remove all contaminated material from the construction area and dispose of material in accordance with applicable regulatory guidelines (i.e. transport to hazardous waste disposal facility by licensed waste hauler). The Owner will be provided with proper documentation showing that material was disposed of in a proper manner.

- Step 3 - Notification: Reporting requirements will depend on the quantity of spill. A spill constituting less than a significant spill event will be reported to Owner and/or Owner's representative Chief Inspector **(CI)-_____: ( ) - (office), or ( ) - (cell).**

  Significant spills are defined as: any amount of petroleum, oils, or lubricants discharged to a receiving stream that causes a film, sheen, or discoloration of surface water or adjoining shoreline; or any reportable quantity of hazardous material as defined by 40CFR320. If a significant spill should take place, Michels' Project Manager (PM), will notify the Prime Contractors' Project Manager and Owner's representative Chief Inspector **(CI)-_____( ) - (office), or ( ) - (cell)** of the spill as soon as he has confirmed that the spill has been completely contained. Michels' PM will assist the Owner's representative in submitting the regulatory-required information for hazardous spill notification in accordance with Governing Agency procedures. At the very minimum the project superintendent will provide the CI with the information required on the "Spill Report" included as **Attachment C** in Appendix C.

- Step 4 – Michels' Project Manager will be responsible for any applicable agency reporting requirements. The notification requirements for petroleum and hazardous materials spills are as follows:

  - Federal Contacts:
    National Spill Response Center 1-800-424-8802

© Copyright, Michels Directional Crossings, a Division of Michels Corporation, 2020

- State Contacts:
  State Department of Environmental
  Quality - Spill Notification ( ) - (Business Hours)
  ( ) - (After Hours)

- Local Contacts:
  Local Fire Department _____

- A completed Petroleum and Hazardous Materials Spill Report must be submitted to OWNER & Governmental Agencies within 48 hours.
- Prior to continuing work, Michels will determine the cause of the spill and implement measures to ensure that further spills will not occur.

A More detailed list of Local Emergency Response Personnel and Hospital Location will be attached and filled out as **Attachment D** in Appendix C.

APPENDIX-A

TABLE I

HAZARDOUS SUBSTANCE INVENTORY

Material	Quantity (gallons)	Storage Location	Reportable Quantity (include reference)
Oil/Fuel:			
Unleaded Gasoline	**10 Gallons**	**5 Gallon DOT-Approved Re-fill able Cans - Storage Trailer**	
	80 Gallons	**Fuel Tank in Bed of Pick-Up Truck**	
Diesel Fuel	**120 Gallons**	**Fuel Tank in Bed of Pick-Up Truck**	
	500 Gallons	**Fuel Tank w/Secondary Containment on Site in excess of 150% of maximum volume**	
Motor Oil	**1 or 5 Gallons**	**Reinforced Plastic Container - Storage Trailer**	
Hydraulic Oil	**110-Gallons**	**Two 55-gallon drums w/Secondary Containment on Site in excess of 150% of maximum volume**	
Commercial Chemicals:			
Ethylene Glycol	**40-Gallons**	**1 or 5 Gallon Reinforced Plastic Containers - Storage Trailer**	
Hazardous Wastes:			

APPENDIX-B

Attachment A

The setbacks specified for refueling, fuel storage, and parking of equipment may not be practicable for certain construction activities, including horizontal directional drilling. Exceptions to the setback requirements may be allowed for:

- Areas where removing equipment from a wetland for servicing or overnight parking would increase adverse impacts to the wetland and/or result in significant construction delays;
- Construction sites where moving equipment to refueling stations from pre-fabricated equipment pads is impracticable or where there is a natural barrier from the water-body or wetland (i.e., dike, road or railroad);
- Locations where the water-body or wetland is located adjacent to a road crossing (from which the equipment can be serviced);
- Refueling and fuel storage for immobile equipment including, but not limited to, bending and boring machines, air compressors, padding machines, and hydro-test fill pumps.

ATTACHMENT B
WEEKLY HAZARDOUS MATERIALS/WASTE INSPECTION LOG

For each item listed below, Contractor will indicate whether existing conditions are acceptable (A) or unacceptable (U). Resolution of all unacceptable conditions must be documented. Contractor will inspect all storage facilities on a regular basis, but not less than weekly. Contractor will keep records of all inspections on file. Contractor will provide a coy of the completed form to the Chief Inspector and Environmental Inspector on a weekly basis.

I. STORAGE AREAS FOR FUELS, LUBRICANTS AND CHEMICALS

General

A/U

_____ Construction yard or storage areas secured

_____ National Fire Protection Association symbol posted in storage area or at yard entrance

_____ Storage areas properly prepared and signed

_____ Material Safety Data Sheets available

_____ Hazardous Materials Management Plan/Spill Prevention and Countermeasure Plan available

Hazardous Materials Management

A/U

_____ No evidence of spilled or leaking materials

_____ Incompatible materials separated

_____ All containers labeled properly

_____ All containers securely closed

_____ All containers upright

_____ No evidence of container bulging, damage, rust or corrosion

Secondary Containment Areas

A/U

_____ Containment berm intact and capable of holding 110% of material stored plus precipitation

_____ Lining intact

_____ No materials overhanging berms

_____ No materials stored on berms

_____ No flammable materials used for berms

Compressed Gases

A/U

_____ Cylinders labeled with contents

_____ Cylinders secured from falling

_____ Oxygen stored at least 25 feet away from fuel

_____ Cylinders in bulk storage are separated from incompatible materials by fire barriers or by appropriate distance

II. HAZARDOUS WASTE MANAGEMENT

Waste Container Storage

A/U

_____ No evidence of spilled or leaking wastes

_____ Adequate secondary containment for all wastes

_____ Separate containers for each waste stream—no piles

_____ Waste area not adjacent to combustibles or compressed gases

_____ All containers securely closed

_____ Bungs secured tightly

_____ Open-top drum hoops secured

_____ All containers upright

_____ No evidence of container bulging, corrosion

_____ No severe container damage or rust

_____ Containers are compatible with waste (e.g. plastic liner for corrosives, metal liner for solvents)

_____ No smoking and general danger/warning signs posted

Waste Container Labeling

A/U

_____ Containers properly labeled

_____ Name, address and EPA ID number or ID Number of generator listed (Not required if Contractor is an exempt small quantity generator.)

_____ Accumulation start date listed

_____ Storage start date listed

_____ Chemical and physical composition of waste listed

_____ Hazardous property listed

Nonhazardous Waste Areas

A/U

_____ No litter in yard

_____ No hazardous wastes or used oil mixed with trash (e.g., contaminated soil, oily rags, diapers, or other oily materials)

_____ Empty oil and aerosol containers for disposal are completely emptied

III. EMERGENCY RESPONSE EQUIPMENT

A/U

_____ Shovels

_____ Absorbent materials (booms, pads, pillows, socks, “Speedy Dry”

_____ Personal protective equipment (goggles, gloves)

_____ Fire-fighting equipment

_____ First aid supplies (e.g. medical supplies, squeeze bottle eye wash)

_____ DOT-approved containers

_____ Plastic sheeting, bags and ties

_____ Communication equipment

_____ Bung wrench (non-sparking)

(Required for all unacceptable conditions)

IV. CORRECTIVE ACTIONS TAKEN

_____

_____

_____

_____

_____

_____

_____

APPENDIX-C

ATTACHMENT C

Petroleum and Hazardous Material Spill Report

Date of spill: _____ Incident No: _____ Date of spill discovery: _____

Time of spill: _____ Time of spill recovery: _____

Location Name: _____ Spread: _____ County: _____

Section: _____ Township: _____ Range: _____

Name and Title of Discoverer: _____

Type of material spilled and product name: _____

Manufacturer's Name: _____

Legal description of spill location: _____

Directions from nearest community: _____

_____

_____

Estimated volume of spill: _____ Estimated material recovered: _____

Weather Conditions: _____

Topography and surface conditions of spill site: _____

Spill medium (pavement, sandy soil, water, etc.): _____

Proximity of spill to surface waters or wetland: _____

Did the spill reach a water body? _____ Yes _____ No

If so, was a sheen present? _____ Yes _____ No

Direction and time of travel (if in stream): _____

Responsible party (name, phone number): _____

Describe the causes and circumstances resulting in the spill: _____

_____

_____

Describe the extent of observed contamination, both horizontal and vertical (i.e., spill-stained soil in a 5'' radius to a depth of 1"):

_____

_____

Resources and installations that may be affected: _____

_____

_____

Potential impact on human health: _____

Describe immediate spill control and/or cleanup methods used and implementation schedule: _____

Current status of cleanup actions: _____

Name/Company/Address/Phone Number for the following:

Construction Superintendent: _____

OWNER
Representative: _____

Environmental Director: _____

Person Who Reported the Spill: _____

Environmental Inspector: _____

On-Scene Agency Coordinator (where applicable): _____

Form completed by: _____ Date: _____

The Contractor must complete this for any petroleum or hazardous material spill regardless of size, and submit the form to OWNER or OWNER's designated representative for construction observation within 48 hours of the occurrence.

ATTACHMENT D
LOCAL Emergency RESPONSE PERSONNEL-HOSPITAL LOCATION

The contractor should provide a listing by municipality of the local emergency response organizations near the HDD project site, and the name and phone number of a contact person for each. For example, list fire and police departments, emergency management organizations, etc. The contractor should update and complete this information as required for his/her work locations. Additions will be made by the Project Manager once they become available prior to drilling operations.

Local Emergency Contacts

- Federal Contacts:

National Spill Response Center	1-800-424-8802

Surface Use Plan of Operation

Attachment 5

Emergency Response Plan, Facility Response Plan, Geographical Response Plan

WBI ENERGY TRANSMISSION, INC.
North Bakken Expansion Project
Section 408 Application

Attachment 5
Emergency Response Plan, Facility Response Plan, and Geographical Response Plan

August 2020

WBI ENERGY TRANSMISSION, INC.
NORTH BAKKEN EXPANSION PROJECT
EMERGENCY RESPONSE PLAN, FACILITY RESPONSE PLAN, AND GEOGRAPHICAL RESPONSE PLAN

1.0 PROJECT DESCRIPTION

WBI Energy Transmission, Inc. (WBI Energy) proposes to construct and operate the North Bakken Expansion Project (or Project), which consists of an approximately 61.9-mile-long, new 24-inch-diameter natural gas pipeline from new facilities at WBI Energy's Tioga Compressor Station near Tioga, North Dakota, to a new compressor station (Elkhorn Creek Compressor Station) southeast of Watford City, North Dakota.

The Project also involves construction of approximately 0.3 mile of new 24-inch-diameter natural gas pipeline between the proposed Elkhorn Creek Compressor Station to a new interconnect with Northern Border Pipeline Company, approximately 20.4 miles of new 12-inch-diameter natural gas pipeline looping along WBI Energy's Line Section 25, approximately 9.4 miles of new 12-inch-diameter natural gas pipeline looping along WBI Energy's Line Section 30, approximately 0.5 mile of new 20-inch-diameter receipt lateral to the Tioga Compressor Station, and uprating of WBI Energy's Line Section 25. The Project includes additional horsepower at the Tioga Compressor Station; the installation of new and modifications to existing delivery, receipt and transfer stations along WBI Energy's pipeline routes; the replacement of small segments of pipeline facilities; and the installation of block valves, pig launcher/receiver stations and other associated appurtenances.

2.0 EMERGENCY REPONSE PLAN

WBI Energy will manage potential sources of gas releases by implementing WBI Energy's Gas System Operations and Maintenance Manual and Control Room Management Manual (CUI/PRIV – DO NOT RELEASE). These are Pipeline Hazardous Materials Safety Administration (PHMSA) approved manuals for the entire WBI Energy system. Copies of these manuals are provided as Appendix A and B in Attachment 6 of the Section 408 application. Once the Project becomes operational, these manuals will be updated to include the required notification procedures and points of contact for the U.S. Army Corps of Engineers.

3.0 FACILITY RESPONSE PLAN

As noted in section 2.0, WBI Energy prepares Operation and Maintenance Plans that include emergency response procedures according to and approved by the U.S. Department of Transportation, Pipeline and Hazardous Materials Safety Administration. In addition, Per 40 CFR 112.20, the EPA Facility Response Planning Compliance Assistance Guide, the North Bakken Expansion Project is not an oil pipeline and does not trigger the need for a Facility Response Plan. Furthermore, the portion of the Project that will be installed below U.S. Army Corps of Engineers owned property and below Lake Sakakawea is a natural gas pipeline, and will not require storage or transport of oil.

4.0 GEOGRAPHICAL RESPONSE PLAN

Most natural gas used in the United States is delivered to consumers through approximately 319,400 miles of gathering and transmission pipelines, providing about 25 percent of the total energy consumption in the United States. Because of the critical role transmission

pipelines play in supplying a large portion of the country's energy needs, it is imperative that they are safe and reliable. Pipelines and related facilities are designed and maintained with strict adherence to Pipeline and Hazardous Materials Safety Administration regulations, which are intended to provide public safety and reliability and minimize the risk of system failure.

The natural gas transmission industry has an excellent record of public safety and reliability. Nevertheless, the transportation of natural gas by pipeline involves some risk to the public in the event of an accidental release of natural gas. The Project will transport natural gas that contains primarily methane, but also smaller amounts of ethane, propane, and higher hydrocarbon gases such as butane. This product is a colorless, practically odorless gas. If natural gas is breathed in high concentrations, oxygen deficiency can occur, resulting in serious injury or suffocation. Natural gas has an auto-ignition temperature of approximately 1,000 degrees Fahrenheit and is flammable at methane concentrations between 5 and 15 percent in air. These concentrations can be reached when natural gas is in a confined space, and could result in a hazard in the presence of an ignition source. Unconfined mixtures of natural gas and air become highly diluted and are not usually explosive. Lighter components of natural gas such as methane are buoyant at atmospheric temperatures and, if released, rise and disperse rapidly in air. Higher hydrocarbon components of natural gas such as propane are heavier than air and, although unlikely, may form a potentially flammable cloud near the ground until sufficiently dispersed in air.

The Pipeline and Hazardous Materials Safety Administration administers the national regulatory program to provide for the safe transportation of natural gas and other hazardous materials by pipeline. Safety regulations and other approaches to risk management provide for safety in the design, construction, testing, operation, and maintenance of pipeline facilities. These standards are specified in Title 49 of the Code of Federal Regulations (CFR) Part 192 (49 CFR 192).

WBI Energy is committed to protecting the safety of those living or working near its pipeline system and working proactively to keep its system operating safely and effectively. Accordingly, the Project will be designed, constructed, tested, operated, inspected, and maintained to meet or exceed the DOT's Minimum Federal Safety Standards specified in 49 CFR 192. These regulations are intended to ensure adequate protection of the public from natural gas pipeline facility accidents and failures; in addition, 49 CFR 192 specifies the minimum material, design, welding, construction, testing, protection from corrosion, operations, maintenance, and personnel qualifications for pipelines. Further, Subpart O requires each pipeline operator to have a detailed integrity management program. As a part of the integrity management program, high-resolution in-line inspection tools (i.e., smart pigs), pressure tests, or direct assessments are periodically performed on the line to assess the pipe for any features requiring remediation (e.g., corrosion, dents, gouges).

As the Project is not an oil pipeline, WBI Energy is not required to develop a Facility Response Plan per 49 CFR 194.101 and 194.103.3. As noted in section 2.0 above, WBI Energy will implement the company-wide Gas System Operations and Maintenance Manual and the Control Room Management Manual (CUI/PRIV – DO NOT RELEASE), which are PHMSA approved documents. Appropriate points of contact and procedures for notifications to the U.S. Army Corps of Engineers will be included in these manuals once the Project becomes operational. Copies of these manuals are included with Attachment 6 of the Section 408 application.

Attachment 6

Operation and Maintenance Plan

(CUI/PRIV - DO NOT RELEASE - WBI Energy's Gas System Operation and Maintenance Manual and Control Room Management Manual**)**

Attachment 7

Reclamation and Monitoring Plan

WBI ENERGY TRANSMISSION, INC.
North Bakken Expansion Project
Section 408 Application

Attachment 7
Reclamation and Monitoring Plan

August 2020

WBI ENERGY TRANSMISSION, INC.
NORTH BAKKEN EXPANSION PROJECT
RECLAMATION AND MONITORING PLAN

WBI Energy Transmission, Inc. (WBI Energy) proposes to construct and operate the North Bakken Expansion Project (or Project), which consists of an approximately 61.9-mile-long, new 24-inch-diameter natural gas pipeline from new facilities at WBI Energy's Tioga Compressor Station near Tioga, North Dakota, to a new compressor station (Elkhorn Creek Compressor Station) southeast of Watford City, North Dakota.

The Project also involves construction of approximately 0.3 mile of new 24-inch-diameter natural gas pipeline between the proposed Elkhorn Creek Compressor Station to a new interconnect with Northern Border Pipeline Company, approximately 20.4 miles of new 12-inch-diameter natural gas pipeline looping along WBI Energy's Line Section 25, approximately 9.4 miles of new 12-inch-diameter natural gas pipeline looping along WBI Energy's Line Section 30, approximately 0.5 mile of new 20-inch-diameter receipt lateral to the Tioga Compressor Station, and uprating of WBI Energy's Line Section 25. The Project includes additional horsepower at the Tioga Compressor Station; the installation of new and modifications to existing delivery, receipt and transfer stations along WBI Energy's pipeline routes; the replacement of small segments of pipeline facilities; and the installation of block valves, pig launcher/receiver stations and other associated appurtenances.

The Project will require crossing of the Lake Sakakawea Reservoir, which is managed by the U.S. Army Corps of Engineers (USACE), along with USACE-owned lands adjacent to Lake Sakakawea. WBI Energy proposes to install the natural gas pipeline under Lake Sakakawea and USACE lands using the horizontal directional drill (HDD) construction method, a trenchless method designed to avoid direct impacts to sensitive features. The HDD workspaces will be located adjacent to USACE-owned lands on the north side of the lake, and approximately 800 feet from USACE-owned lands on the south side of Lake Sakakawea. No surface impact to USACE lands is anticipated for this Project during installation and operation of the pipeline; all temporary surface impacts will be located outside of USACE lands. Access in the area of the proposed HDD will be along public and private roads.

WBI Energy has acquired Michels Corporation (Michels) to perform the horizontal direction drilling operations for installation of the pipeline beneath Lake Sakakawea. Two drilling rigs will be used (both on private land), located on either side of Lake Sakakawea. The drilling rigs will be installed on matting and minimal surface disturbance outside of the proposed drill box locations is anticipated to occur.

No excavation will occur on USACE lands and no tracked equipment is anticipated to be used on USACE lands. Based on the technical analysis completed to date, WBI Energy does not anticipate an inadvertent return of drilling fluid into Lake Sakakawea. In the unlikely event of an inadvertent return of drilling fluid within Lake Sakakawea, WBI Energy would implement emergency procedures outlined in Michels' Horizontal Direction Drilling Installation Plan filed as Attachment 1 of the Section 408 Application. Notifications would be made to the appropriate federal and state contacts within one hour of identification. Specialized crews would mobilize utilizing agreed upon routes from the Project workspace if the return is located on USACE owned property and deploy turbidity curtains (as appropriate) to contain the release to the smallest impact.

WBI Energy is requesting that the post-construction monitoring requirement be waived on USACE lands, assuming no inadvertent return occurs on USACE property. No surface improvements (e.g., fencing, recreation facilities) will be impacted by the proposed Project. No land disturbance occurring on USACE land is anticipated to occur, however in the unlikely event of an inadvertent return, any land disturbance occurring on USACE land will be restored and revegetated according to the FERC Plan and Procedures and additional requests beyond those outlined in the Plan and Procedures would be address in coordination with the USACE Garrison Project Office.

On lands impacted by typical pipeline construction (outside of the HDD path) WBI Energy will restore Project work areas to pre-construction conditions as required in the Federal Energy Regulatory Commission's (FERC) *Upland Erosion Control, Revegetation, and Maintenance Plan* (Plan) and *Wetland and Waterbody Construction and Mitigation Procedures* (Procedures), which have been provided for reference as attachments to the Erosion and Sediment Control Plan included for the Project.

Risk Assessment Plan

August 2020

WBI ENERGY TRANSMISSION, INC.
NORTH BAKKEN EXPANSION PROJECT
RISK ASSESSMENT PLAN

1.0 PROJECT DESCRIPTION

WBI Energy Transmission, Inc. (WBI Energy) proposes to construct and operate the North Bakken Expansion Project (or Project), which consists of an approximately 61.9-mile-long, new 24-inch-diameter natural gas pipeline from new facilities at WBI Energy's Tioga Compressor Station near Tioga, North Dakota, to a new compressor station (Elkhorn Creek Compressor Station) southeast of Watford City, North Dakota.

The Project also involves construction of approximately 0.3 mile of new 24-inch-diameter natural gas pipeline between the proposed Elkhorn Creek Compressor Station to a new interconnect with Northern Border Pipeline Company, approximately 20.4 miles of new 12-inch-diameter natural gas pipeline looping along WBI Energy's Line Section 25, approximately 9.4 miles of new 12-inch-diameter natural gas pipeline looping along WBI Energy's Line Section 30, approximately 0.5 mile of new 20-inch-diameter receipt lateral to the Tioga Compressor Station, and uprating of WBI Energy's Line Section 25. The Project includes additional horsepower at the Tioga Compressor Station; the installation of new and modifications to existing delivery, receipt and transfer stations along WBI Energy's pipeline routes; the replacement of small segments of pipeline facilities; and the installation of block valves, pig launcher/receiver stations and other associated appurtenances.

The Project will require crossing of the Lake Sakakawea Reservoir, which is managed by the U.S. Army Corps of Engineers (USACE), along with USACE-owned lands adjacent to Lake Sakakawea. WBI Energy proposes to install the natural gas pipeline under Lake Sakakawea and USACE lands using the horizontal directional drill (HDD) construction method, a trenchless method designed to avoid direct impacts to sensitive features. The HDD workspaces will be located adjacent to USACE-owned lands on the north side of the lake, and approximately 800 feet from USACE-owned lands on the south side of Lake Sakakawea. No surface impact to USACE lands is anticipated for this Project during installation and operation of the pipeline; all temporary surface impacts will be located outside of USACE lands. Access in the area of the proposed HDD will be along public and private roads.

2.0 RISK ASSESSMENT OVERVIEW

WBI Energy and their contractors have prepared a HDD Design Report that addresses the engineering design for the HDD of Lake Sakakawea and evaluates the factor of safety for the HDD. The HDD Design Report is attached as Appendix A. The sections below provide additional information on the regulatory safety framework for natural gas pipelines and WBI Energy's operating and emergency response measures

2.1 NATURAL GAS TRANSMISSION PIPELINE SAFETY STANDARDS

Most natural gas used in the United States is delivered to consumers through approximately 319,400 miles of gathering and transmission pipelines, providing about 25 percent of the total energy consumption in the United States (U.S. Department of Transportation [DOT], Pipeline and Hazardous Materials Safety Administration [PHMSA], 2019a,b). Because of the critical role transmission pipelines play in supplying a large portion of the country's energy needs,

it is imperative that they are safe and reliable. Pipelines and related facilities are designed and maintained with strict adherence to PHMSA regulations, which are intended to provide public safety and reliability and minimize the risk of system failure.

The natural gas transmission industry has an excellent record of public safety and reliability. Nevertheless, the transportation of natural gas by pipeline involves some risk to the public in the event of an accidental release of natural gas. The Project will transport natural gas that contains primarily methane, but also smaller amounts of ethane, propane, and higher hydrocarbon gases such as butane. This product is a colorless, practically odorless gas. Project facilities will be odorized as appropriate per Title 49 of the CFR Part 192 (49 CFR 192) part 625. If natural gas is breathed in high concentrations, oxygen deficiency can occur, resulting in serious injury or suffocation. Natural gas has an auto-ignition temperature of approximately 1,000 degrees Fahrenheit and is flammable at methane concentrations between 5 and 15 percent in air. These concentrations can be reached when natural gas is in a confined space, and could result in a hazard in the presence of an ignition source. Unconfined mixtures of natural gas and air become highly diluted and are not usually explosive. Lighter components of natural gas such as methane are buoyant at atmospheric temperatures and, if released, rise and disperse rapidly in air. Higher hydrocarbon components of natural gas such as propane are heavier than air and, although unlikely, may form a potentially flammable cloud near the ground until sufficiently dispersed in air.

The PHMSA administers the national regulatory program to provide for the safe transportation of natural gas and other hazardous materials by pipeline. Safety regulations and other approaches to risk management provide for safety in the design, construction, testing, operation, and maintenance of pipeline facilities. These standards are specified in 49 CFR 192.

2.1.1 Pipeline Design, Construction, and Operating Standards

WBI Energy is committed to protecting the safety of those living or working near its pipeline system and working proactively to keep its system operating safely and effectively. Accordingly, the Project will be designed, constructed, tested, operated, inspected, and maintained to meet or exceed the DOT's Minimum Federal Safety Standards specified in 49 CFR 192. These regulations are intended to ensure adequate protection of the public from natural gas pipeline facility accidents and failures; in addition, 49 CFR 192 specifies the minimum material, design, welding, construction, testing, protection from corrosion, operations, maintenance, and personnel qualifications for pipelines. Further, Subpart O requires each pipeline operator to have a detailed integrity management program (IMP). As a part of the IMP, high-resolution in-line inspection tools (i.e., smart pigs), pressure tests, or direct assessments are periodically performed on the line to assess the pipe for any features requiring remediation (e.g., corrosion, dents, gouges).

DOT regulations in 49 CFR 192 define area classifications (called class location units) based on population density in the vicinity of a pipeline, and specify more rigorous safety requirements for populated areas. Each class location unit covers the area extending 220 yards on either side of the centerline of any continuous 1-mile length of pipeline. The proposed Project will fall under a Class 1 designation for its entire length, which is specified by any class location unit that has 10 or fewer buildings intended for human occupancy.

WBI Energy will monitor population changes in the vicinity of the pipeline over the life of the pipeline system. If an increase in population density adjacent to the right-of-way is detected,

WBI Energy will evaluate whether a change in class location is required and respond accordingly while meeting requirements of 49 CFR 192.

DOT regulations (49 CFR 192, Subpart O) additionally specify how pipeline operators must identify, prioritize, assess, evaluate, repair, and validate the integrity of natural gas transmission pipelines that could affect High Consequence Areas (HCAs) in the event of a leak or failure. The regulations require pipeline operators to develop and follow a written IMP that contains all the elements described in 49 CFR 192.911 and addresses the risks on each covered segment of the transmission pipeline. The criteria for an HCA in regards to a natural gas pipeline is the area within the potential impact circle containing 20 or more buildings intended for human occupancy, or any area within a potential impact circle that contains an identified site.[1]

No HCAs have been identified along the proposed Project route. However, the Project will be incorporated into WBI Energy's existing IMP and use the following criteria to determine HCA locations if conditions change along the pipeline system:

- identification of a site with 20 or more buildings intended for human occupancy; or
- location of an identified site.

On October 1, 2019, PHMSA issued a final rule amending the Federal Pipeline Safety Regulations in 49 CFR 191 and 192 to address integrity management requirements and improve the safety of onshore gas transmission lines (84 Federal Register 52180). The amendments, which will become effective July 1, 2020, focus on reconfirmation of MAOP for existing pipelines and the expansion of assessment requirements for pipelines in areas not designated as HCAs. The criteria for a moderate consequence area (MCA) as defined in the new amendments is an area that is within the potential impact circle of the pipeline that contains five or more buildings intended for human occupancy, or any portion of the paved surface including shoulders of a designated interstate, freeway, expressway, or any other principal arterial roadway with four or more lanes that lies within the potential impact circle. WBI Energy has identified one MCA that will exist where the new Tioga-Elkhorn Creek pipeline will cross 64th Street NW/Highway 2. WBI Energy will install additional launching and receiving facilities on both sides of this MCA that will allow for assessing the area.

2.2 OPERATING AND EMERGENCY RESPONSE MEASURES TO PROTECT THE PUBLIC

WBI Energy maintains operating policies and procedures that are periodically reviewed by the DOT. The policies provide specific directions in regular preventive maintenance and vigilant patrols of facilities, as well as procedures to follow in the event of an accident or natural catastrophe. All operating personnel are trained to perform operations and maintenance activities in accordance with these policies and procedures. Further, periodic training sessions are conducted for operations employees to review typical operating and emergency response procedures or to update employees on changes in procedures. This training includes safe operation of pipeline and aboveground facilities; hazardous material handling procedures;

[1] An identified site is defined as an outside area or open structure that is occupied by 20 or more persons on at least 50 days in any 12-month period; a building that is occupied by 20 or more persons on at least 5 days a week for any 10 weeks in any 12-month period; or a facility that is occupied by persons who are confined, are of impaired mobility, or would be difficult to evacuate.

firefighting; public liaison; and general operating procedures. The proposed Project will be operated and maintained in accordance with each of these policies and procedures.

2.2.1 Line Patrols

WBI Energy will inspect the pipelines periodically on foot, by all-terrain vehicle, or by other vehicle as required by applicable regulatory requirements to identify potential concerns that may affect the safety and operation of the pipelines. Pipeline markers and signs will be inspected and maintained or replaced, as necessary, to ensure that pipeline locations are clearly identified. Field personnel will advise the appropriate operations personnel of new construction along or near the pipeline system. Issues identified are investigated and appropriately remediated based on risk assessment.

2.2.2 Integrity Management

The proposed Project will be hydrostatically tested throughout its entire length before it is put into service. In this procedure, water or test media is introduced into the pipelines and pressurized to a specified level above the maximum allowable operating pressure for a specified amount of time. This test is used to confirm that the facility will operate safely at the designed pressure.

WBI Energy will also conduct a baseline assessment using in-line inspection of the proposed pipelines to check for damage, deformities, or other factors that could affect the integrity of the pipelines. If potential problems are identified, repairs will be made to the affected segment of pipe.

2.2.3 System Control

The proposed Project will be incorporated into WBI Energy's extensive Supervisory, Control, and Data Acquisition System (SCADA). The Gas Control Center is located at WBI Energy's headquarters in Bismarck, North Dakota, and is staffed 24 hours a day, 365 days a year. Gas controllers use SCADA to monitor the pipeline system, which includes a wide range of activities such as monitoring gas pressures and flows along the pipeline, physical startup and shutdown of compressor sites, and operating system valves along the pipeline.

Data acquisition occurs at many locations along the mainline, such as compressor stations, and meter stations. This data is transmitted to Gas Control through SCADA. If system parameters fall outside a predetermined range, an alarm is activated at Gas Control and corrective action is taken by the gas controller as needed. Local WBI Energy personnel are dispatched in response to these alarms if intervention is required outside Gas Control.

2.2.4 Corrosion and Cathodic Protection

49 CFR 192 Subpart I prescribes minimum requirements for the protection of metallic pipelines from external, internal, and atmospheric corrosion. Line pipe used to construct the Project will be externally coated at the pipe mill with fusion bond epoxy. A compatible coating will be applied in the field over circumferential welds and assembly piping will be coated with epoxy-based or tape style coatings.

In accordance with PHMSA requirements, WBI Energy will install cathodic protection systems at various points along the proposed pipelines to inhibit external corrosion of the

underground facilities. This cathodic protection system imparts a low-voltage current to the pipeline to offset natural soil corrosion potential should the coating become damaged over the life of the pipeline. WBI Energy will inspect the cathodic protection system at regular intervals to ensure proper operating conditions consistent with PHMSA requirements for corrosion mitigation.

2.2.5 Pipeline Markers

WBI Energy will install markers at road and railroad crossings, as well as other locations (e.g., fence lines and stream crossings) to indicate the pipeline location and convey emergency information in accordance with DOT safety requirements.

2.2.6 Emergency Preparedness and Procedures

DOT regulations prescribe minimum standards for operating and maintaining pipeline facilities, including a requirement to establish a written plan governing these activities. Additionally, pipeline operators are required to establish an emergency plan that identifies procedures to minimize hazards in a natural gas pipeline emergency to protect the public and the environment. Key elements of the plan include procedures for the following tasks:

- receiving, identifying, and classifying emergency events, gas leakage, fires, explosions, and natural disasters;
- establishing and maintaining communications with local fire, police, and public officials, and coordinating emergency response;
- emergency system shutdown and safe restoration of service;
- making personnel, equipment, tools, and materials available at the scene of an emergency; and
- protecting people first and then property, and making them safe from actual or potential hazards.

WBI Energy currently has an emergency response plan (ERP) for its existing pipeline system in accordance with DOT regulations. WBI Energy will update its ERP, as necessary, to incorporate the proposed Project. The ERP will be made available prior to and during construction and will contain the appropriate emergency contacts (e.g., names and telephone numbers).

2.2.7 Liaison with Local Authorities

The DOT requires that pipeline operators establish and maintain liaison with local fire, police, and other emergency responders to plan for and coordinate emergency response efforts in the event of an incident during construction or operation of the proposed facilities. Each operator must also establish a continuing education program to enable customers, the public, government officials, and those engaged in excavation activities to recognize a gas pipeline emergency and report it to the appropriate public officials. The proposed Project is located within WBI Energy's existing operating counties. As such, WBI Energy will continue to work with the local public officials and emergency responders, and provide appropriate training to responders.

2.2.8 Public Awareness

WBI Energy's public awareness program for its existing pipeline system provides information to the affected public, emergency officials, and public officials, as well as excavators. The messaging includes but is not limited to:

- pipeline purpose and reliability;
- awareness of hazards and prevention measures undertaken;
- emergency preparedness communications;
- damage prevention awareness;
- one-call requirements;
- leak recognition and response;
- pipeline location and operator information;
- National Pipeline Mapping System information; and
- how to get additional information.

WBI Energy will incorporate the Project into its public awareness program.

2.2.9 Damage Prevention

WBI Energy is a member of "One Call" and related pre-excavation notification organizations in the states where it operates, including North Dakota. Through "One Call," contractors or private individuals provide notification of proposed excavations to a central agency that, in turn, will notify WBI Energy of the excavation locations. If WBI Energy facilities are located in the area of proposed excavation, company representatives will mark the pipeline location, consult with the excavator as needed, and observe the excavation as necessary to prevent damage to the pipeline. WBI Energy supports enforceable one-call legislation in all of the states crossed by its pipeline facilities.

1 INTRODUCTION

WBI Energy Transmission, Inc. (WBI) is planning to construct a pipeline crossing of the Missouri River (Lake Sakakawea) within North Dakota, between the cities of Tioga and Watford City as part of the North Bakken Expansion Project. The project involves approximately 60 miles of new NPS 24 (24" O.D.) natural gas pipeline that will connect WBI Energy's Tioga Compressor Station near Tioga, North Dakota, with Northern Border Pipeline Company's mainline at a new interconnection point south of Watford City, North Dakota. The pipeline is for natural gas takeaway to help reduce natural gas flaring in the area. The pipeline alignment crosses the Missouri River approximately 24 miles north of Watford City and 23 miles east of Williston, ND. At the crossing location, the Missouri River forms Lake Sakakawea, which contains a historic channel traversing the lake, and is a United States Army Corps of Engineers (USACE) monitored navigable waterway. This report will focus on the feasibility of the North Bakken Missouri River crossing utilizing the Horizontal Directional Drill (HDD) trenchless construction method. The proposed HDD crossing will cross beneath the entire width of the lake, measuring 15,393 ft in length from entry to exit.

This report is provided as a feasibility assessment of site conditions, incorporating the available geotechnical information and a geometric review of the proposed HDD alignment and design along with annular pressure analysis and pipe stress analysis. Also included are some challenges the contractor may face and some mitigation strategies that may be implemented to minimize the project risks. This assessment is also intended to provide verification that the HDD design meets USACE requirements.

2 DESIGN PARAMETERS

The parameters utilized in the design of the crossing are as follows:

a) The Pipeline Research Council International (PRCI) design guidelines (PR-277-144507-R01) and ASME B31.8 requirements, as applicable, were utilized to model the bending, external hoop, tensile, and combined stress cases for the installation and operating conditions imposed on the pipe.
b) The calculations consider the pipe material, diameter, wall thickness, grade, depth, and the geometric design of the crossing.
c) The geotechnical conditions at the site were analyzed to design the drill for progression through formations that are favorable for horizontal directional drills, where possible, with consideration given to potential borehole instability and surficial casing installation.
d) The HDD crossing was designed by completing an assessment of the annular pressure to minimize the risk of hydraulic fracture to the surface or water body during drilling of the pilot hole. The HDD crossing was designed to have a factor of safety against hydraulic fracture beneath the Missouri River (Lake Sakakawea) of greater than 2.0, as per USACE calculations. The annular pressure calculation models the potential fracture pressure of the overburden formation versus the downhole pressures created during the pilot hole phase of the construction.
e) Space limitations associated with points of inflection (PI), topographical features, and achievable temporary workspace (TWS) were considered. Temporary workspace has been selected to ensure that the required equipment can be set up on site to complete the work and to minimize grading requirements and disturbance.
f) The entry and exit positions have been identified based on the location of the pipe section lay out for installation, generally at the exit location. The drill is designed as an intersect and will have a drill rig set up at both the entry and exit locations.
g) The crossing has been designed with consideration of the pullback section and available layout. These plans will be updated (if required) to allow for multiple sections and/or contractor input.

h) All elevations and topographic survey data utilized are based off North American Vertical Datum 88 (NAVD 88) and State Plane North Dakota North coordinate system.

3 MISSOURI RIVER CROSSING LOCATION

3.1 SITE DESCRIPTION

The proposed HDD crosses the Missouri River (Lake Sakakawea) within McKenzie and Williams County, North Dakota. The proposed pipeline alignment is located approximately 24 miles north of Watford City and 23 miles east of Williston, ND, and is shown in Figure 1, below. The length of the proposed HDD measures approximately 15,393 ft.

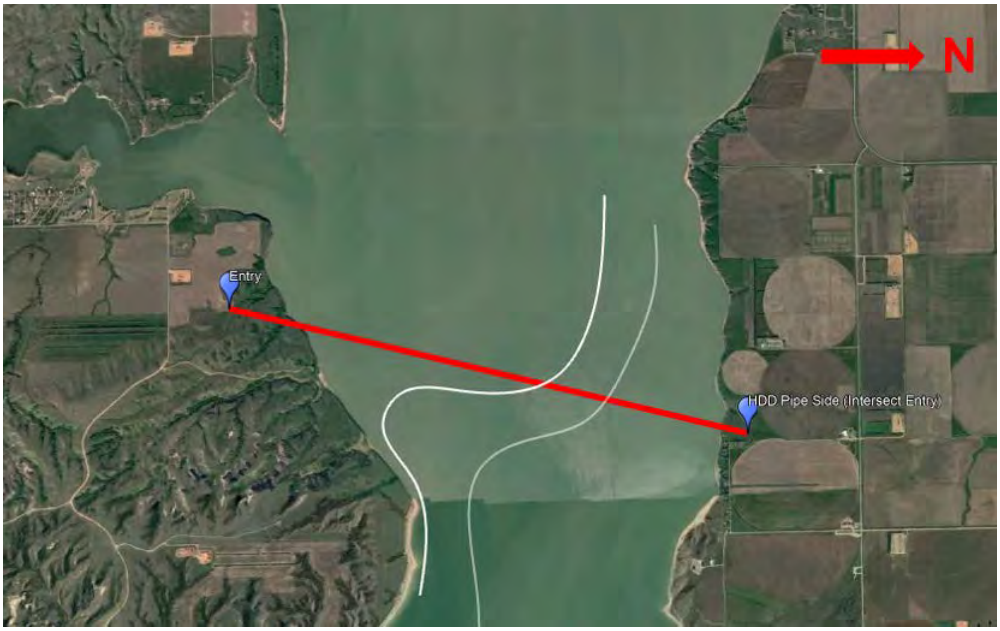

Figure 1. Proposed HDD Alignment Location

The proposed HDD entry location is situated in a relatively level, cultivated grass field, southwest of rugged terrain along the edge of the Missouri River and east of Tobacco Garden Bay. From entry, the HDD alignment follows the proposed pipeline right-of-way down rolling, sloped terrain towards the south bank, crosses the Missouri River (Lake Sakakawea) and climbs the north bank to the location of the HDD exit. The exit location is situated within a maintained grass field, west of several houses along the lake. The pipe string staging and preparation area, shown in Figure 2, is located to the north of the exit point (pipe side) within a proposed temporary workspace area. The planned pipe string and pullback alignment continues to the north, crossing 52nd Street NW and a cultivated field before roping to parallel Highway 17A, ending at Highway 1804 (54th Street NW).

The land near the proposed HDD consists of primarily agricultural fields and grassed areas with several residential buildings in proximity of the northern work site.

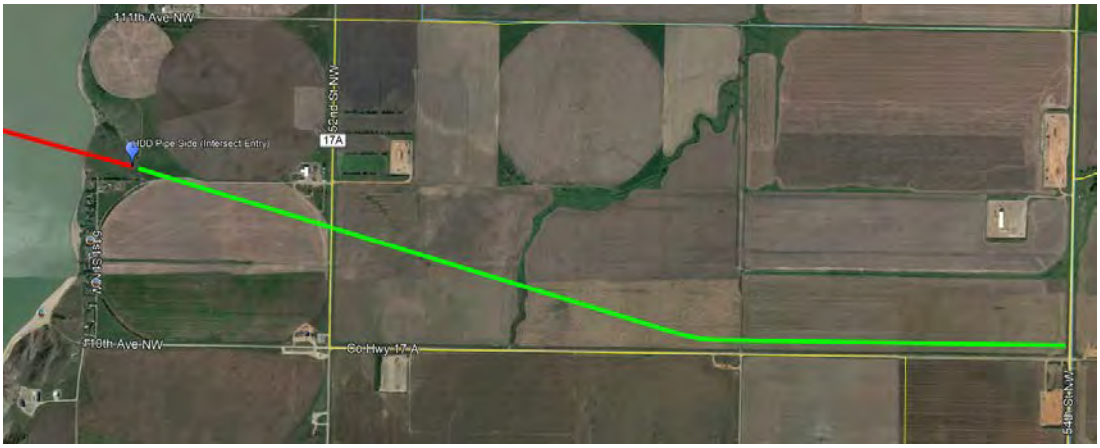

Figure 2. Proposed HDD Pipe Stringing Location

3.2 GEOLOGICAL SETTING

The geology in the area consists of glacial deposits overlying the Sentinel Butte Formation followed by the Bullion Creek Formation, both of the Paleocene Age. The Sentinel Butte Formation consists of layers of silt, clay, sand, lignite, carbonaceous shale, and mudstone. The Bullion Creek Formation comprises primarily silt, clay, sand with interbedded sandstone, lignite, baked clay, and limestone. Both formations are poorly lithified and form rolling topography over areas of Western North Dakota. It is expected that the proposed HDD bore path will be encompassed within the Sentinel Butte Formation and not encounter the Bullion Creek Formation.

3.3 GEOTECHNICAL REVIEW

To form a basis on evaluating the site specific subsurface conditions, CCI sub-contracted Groundwater & Environmental Services, Inc. (GES) to perform a subsurface exploration and laboratory testing program at the proposed HDD site to support the feasibility evaluation and design of the Lake Sakakawea crossing. As part of the geotechnical program, two investigations were completed: one (1) land-based investigation and one (1) water-based investigation. Associated subsequent geotechnical reports entitled "Geotechnical Investigation Report – WBI North Bakken Expansion Project", dated June 14, 2019 and "Geotechnical Investigation Report, Water-Based Borings – WBI North Bakken Expansion Project", dated July 9, 2020 were completed. As part of the land-based investigation, three (3) exploratory land borings, LB-1 to LB-3, were drilled/sampled to depths between 372 and 403 ft below ground surface. As part of the water-based investigation, six (6) additional water-based borings, WB-1 to WB-6, were drilled/sampled to depths between 300 and 315 ft below the Lake Sakakawea thalweg.

The locations of the nine (9) geotechnical borings relative to the HDD alignment are shown in Figure 2, below, and depicted in the design drawing attached in Appendix A.

Figure 3. Borings Location Plan

The borehole coordinates were obtained during the geotechnical investigation by GES using a handheld GPS. The borehole depths and coordinates are shown below in Table 1.

Table 1. Geotechnical Boring Locations and Depths

Borehole	Depth (ft)	Latitude	Longitude
LB -1	403	48.115647°	-103.092842°
LB-2	400	48.117656°	-103.092611°
LB-3	372	48.156139°	-103.077672°
WB-4	300	48.123139°	-103.090536°
WB-5	300	48.128400°	-103.087644°
WB-6	300	48.133994°	-103.086317°
WB-7	315	48.138314°	-103.083792°
WB-8	300	48.146003°	-103.081647°
WB-9	310	48.150150°	-103.079189°

A summary of the encountered subsurface conditions encountered during the geotechnical program, as well as some concerns regarding the geotechnical conditions as they relate to HDD construction operations is listed below in Table 2 and 3. A copy of the detailed geotechnical boring logs from GES' geotechnical investigation is located within the Geotechnical Reports provided in Appendix E.

Table 1. Generalized Summary of the Boring Logs for Missouri River

Borehole	Location	Geologic Description[1, 2]	Primary Geotechnical Concerns
LB -1	Approx. 130 ft NE of entry point, near NE corner of entry pad TWS	0 – 25 ft: Med. Dense Sand 25 – 110 ft: V. Stiff to Hard Lean/Fat Clay and Silt 110 – 211 ft: Hard Fat/Lean Clay 211 – 233 ft: Coal 233 – 288 ft: Highly Weathered, Hard Shale 288 – 403 ft: Hard Silt	Thick coal layer encountered from 211 to 233 ft. Intermittent coal layers/lenses frequently encountered below 233 ft. Fat clays/shale could contain high swell potential.
LB-2	Approx. 930 ft NE of entry point, west side of HDD CL	0 –35 ft: Loose to Med. Dense Silt/Silty Sand. 35-55 ft: V. Stiff Fat Clay 55 – 120 ft: Loose to Dense Sand 120 – 153 ft: Hard Silt and Lean Clay 153 – 215 ft: Highly Weathered Shale and Siltstone	Loose granular materials encountered poses slough risk. Thick coal layer encountered from 215 to 238 ft. Intermittent coal layers/lenses frequently

Borehole	Location	Geologic Description[1, 2]	Primary Geotechnical Concerns
		215 – 238: Coal 238 – 350 ft: Hard Silt 350 – 380 ft: Dense Sand 380 – 400 ft: Highly Weathered Shale	encountered below 238 ft. Fat clays/shale could contain high swell potential.
LB-3	Approx. 100 ft from exit point, along southern edge of exit pad TWS	0 – 115 ft: V. Loose to V. Dense Sand and Silty Sand 115 – 140 ft: Coal 140 – 202 ft: V Dense/Hard Sand, Silt and Lean Clay 202 – 252 ft: Hard Silt with coal lenses 252 – 290 ft: V. Dense Sand 290 – 336 ft: Highly Weathered, Hard Shale 347 – 372 ft: V. Dense Silty Sand	Loose granular materials encountered poses slough risk. Thick coal layer encountered from 115 to 140 ft. Intermittent coal layers/lenses frequently encountered below 140 ft. Shale contains swell potential.
WB-4	Approx. 2,900 ft from entry point, west side of HDD CL	0 – 45 ft: Soft/Loose Lean Clay and Sand 45 – 53 ft: Loose Gravelly Sand 53 – 81 ft: Hard Lean Clay 81 – 102 ft: Highly Weathered, Hard Shale 102 – 127 ft: Coal 127 – 277 ft: Highly Weathered, Hard Shale and Weakly Cemented, V. Dense Sandstone 287 – 300 ft: Highly Weathere, Hard Shale	Granular (alluvial) materials encountered poses slough risk. Thick coal layer encountered from 102 to 127 ft. Intermittent coal layers/lenses frequently encountered below 127 ft. Shale could contain high swell potential.
WB-5	Approx. 4,950 ft from entry point, east side of HDD CL	0 – 35 ft: Med. Stiff/Loose Silt and Sand 35 – 85 ft: Med. to V. Dense Sand and Gravel 85 – 140 ft: Hard/Dense Lean Clay and Sand 140 – 245 ft: Highly Weathered, Hard Shale 245 – 267 ft: Weakly Cemented, V. Dense Sand 267 – 280 ft: Coal 280 – 300 ft: Hard Lean Clay	Thick coal layer encountered from 267 to 280 ft. Intermittent coal layers/lenses frequently encountered below 140 ft. Shale could contain high swell potential.
WB-6	Approx. 7,000 ft from entry point, west side of HDD CL	0 – 70 ft: V. Loose to Med. Dense Sand 70 – 115 ft: V. Stiff Lean/Fat Clay and Silt 115 – 220 ft: Dense to V. Dense Sand 220 – 300 ft: Highly Weathered, Hard Shale	Frequent coal layers/lenses encountered below 220 ft. Fat clays/shale could contain high swell potential.
WB-7	Approx. 8,690 ft from entry point, east side of HDD CL	0 – 56 ft: V. Loose to Med. Dense Sand 56 – 120 ft: Med. Dense/V. Stiff Sand and Lean Clay 120 – 210 ft: Dense to V. Dense Sand 210 – 235 ft: Highly Weathered, Hard Shale 235 – 253 ft: Coal 253 – 315 ft: Highly Weathered, Hard Shale	Thick coal layer encountered from 235 to 253 ft. Intermittent coal layers/lenses frequently encountered below 253 ft. Shale could contain high swell potential.
WB-8	Approx. 3,840 ft from exit point, west side of HDD CL	0 – 35 ft: V. Soft to Med. Stff Lean Clay and Silt 35 – 150 ft: V. Loose to V. Dense Sand 150 – 230 ft: Highly Weathered, Hard Shale 230 – 240 ft: Coal 240 – 290 ft: Highly Weathered, Hard Shale 290 – 300 ft: Coal	Thick coal layers encountered in the bedrock. As well, thinner intermittent coal layers/lenses frequently encountered. Shale could contain high swell potential.
WB-9	Approx. 2,230 ft from exit point, west side of HDD CL	0 – 140 ft: V. Loose to V. Dense Sand and Gravelly Sand 140 – 225 ft: Highly Weathered, Hard, Shale 225 – 235 ft: Coal 235 – 290 ft: Highly Weathered, Hard, Shale 290 – 305 ft: Coal 305 – 310 : Highly Weathered, Hard, Shale	Thick coal layers encountered in the bedrock. As well, thinner intermittent coal layers/lenses frequently encountered. Shale could contain high swell potential.

Note 1: Soil descriptions as per United Soil Classification System (USCS)
Note 2: Soil Consistency and Relative Density determined as per in-situ SPT N-Value

Although variations exist, the subsurface conditions were similar in the nine (9) borings. In general, the subsurface conditions comprised overburden glacial and alluvial deposits to depths between 127 and 290 ft below the surface/thalweg overlying the Sentinel Butte Formation to the depth of the investgation. The glacial and alluvial deposits predominantly consisted of variable deposits of fat/lean clay, sand and silt with thin, frequent interbedded layers of gravel and coal. The consistency of the overburden material increased with depth, starting as soft/loose and becoming hard/very dense. As noted, the bedrock of the Sentinel Butte Formation consisted of primarily poorly lithified shale and sand. Within the formation, two

(2) relatively continuous coal layers were identified along the length of the drill. The coal layers varied in thickness from approximately 5 to 30 ft, with frequently encountered thinner layers/lenses.

Although not encountered in the geotechnical investigation, there is potential to encounter cobbles and/or boulders along the drill path. By definition, glacial deposits consists of a variations of all soil types, including a random distribution of cobble and boulder sized materials, and granular layers/lenses.

No standpipes were installed. Rather, groundwater conditions were inferred from seepages noted and measurements taken during drilling. For the land-based borings, water was observed at 24 ft in LB-3 whereas LB-1 and LB-2 remained dry; however, in each of these borings mud-rotary drilling commenced at a depth of 25 ft, precluding deeper measurements. No groundwater measurements were obtainable in the water-based borings since a perfect seal was not feasible on the casing through the lake. It is expected that the groundwater is situated at an elevation equivalent to the elevation of Lake Sakakawea.

The proposed HDD is anticipated to be within shale of the Sentinel Butte Formation for most of its length, passing through overburden/alluvial deposits as it nears surface at the entry and exit locations. As noted, the overburden/alluvial deposits consist of variations of fat/lean clay, sand and silt. Two relatively continuous coal layers, approximately 5 to 30 ft thick, are proximate to the bottom tangent of the bore path.

4 HDD CROSSING CONSIDERATIONS

4.1 PIPE SPECIFICATIONS

The pipeline specifications provided by WBI are summarized in Table 3. These parameters were used in the engineering design of the Missouri River HDD crossing.

Table 3. Pipe Specifications for the Missouri River HDD Crossing

Parameter	NPS 24 HDD
Outside Diameter (inch)	24
Wall Thickness (inch)	0.99
Pipe Material	Steel
Carried Product	Natural Gas
Specification	API 5L
Grade	X60
Specified Minimum Yield Strength (SMYS) (psi)	60,000
Chosen Design Radius (ft)	5,000
Minimum Allowable Design Radius (MADR) (ft)	1,500
Entry Angle	15°
Exit Angle	14°
Borehole Diameter (inch)	36
Maximum Operating Temperature (°F)	100
Minimum Installation Temperature (°F)	60
Maximum Operating Pressure (psi)	1,480

4.2 HDD ALIGNMENT

The proposed crossing follows a southwest to northeast alignment with the proposed entry and exit (pipe layout) points located approximately 2,100 ft south and 850 ft north of the Missouri River edge of water, respectively. The crossing passes beneath the lake for approximately 12,300 ft. Temporary workspace (TWS) is required at both ends of the crossing to facilitate entry and exit-side construction spreads, which are planned to have workspace dimensions of 300 ft x 300 ft (on the south) and 270 ft x 300 ft (on the north).

The proposed crossing is planned to be completed by intersect methodology, approximately 6000-9000 ft will be competed from either direction, the drill paths will intersect within a 3200 ft "intersect zone". The details of the design are shown on the Issued for Permit (IFP) HDD design drawing [2386-EG-0101, Rev G, dated July 31, 2020] provided in Appendix A.

4.3 BOREHOLE SIZE

The final borehole diameter must be larger than pipe outer diameter to facilitate pipeline installation and reduce the drag forces acting on the pipe while allowing for proper drilling fluid circulation within the annulus. The general industry standard for pipes with diameter more than 20 inches is a final borehole diameter 12 inches larger than the pipe outer diameter. For the proposed NPS 24 HDD crossing, the minimum final borehole diameter is expected to be 36 inches.

4.4 ENTRY AND EXIT ANGLES

The entry and exit angles have been selected based on expected geologic formations and casing requirements, bending restrictions, topography and the support of the pullback section. The entry angle (south) has both been selected to be 15° for this crossing to minimize casing requirements while adhering to geometric constraints and depth. The exit angle was selected to minimize casing requirements on exit while considering the overbend support height and support equipment requirements. The exit angle has been designed to be 14° for the proposed crossing. Due to the pipe size and specification, significant equipment is still required to lift and safely support the pipe above ground during installation. The risks associated with above-ground pipe support equipment requirements on site will be discussed further in the construction risk assessment.

4.5 HDD DEPTH OF COVER

Selection of an HDD depth is based on several parameters including geological formation, casing requirements, required overburden pressure to overcome the drilling fluid annular pressure (while maintaining an adequate factor of safety), and watercourse geometric parameters. The proposed installation depth considered should maximize the length of drill advancing through favorable materials for directional drilling to maximizing borehole stability during hole opening and pipe installation. The drill path is designed to avoid the coal layers identified in the geotechnical investigation for as much of the drill path as possible.

The bottom tangent depth for the proposed NPS 24 HDD is around 250 ft below the bottom of the lake. It is expected that the majority of the drill path will be within shale of the Sentinel Butte Formation based on the 9 geotechnical borings described above. The design depth for the proposed crossing is expected to provide adequate overburden pressure to counteract the expected drilling fluid pressures while utilizing the HDD pilot hole intersect method. Further details about annular pressure modeling are discussed in Section 5.1.

4.6 DESIGN RADIUS

The standard practice in the HDD industry is to utilize 1,200 times the nominal pipe diameter (in ft) as the design radius of curvature (ROC). For example, an NPS 24 (2 ft O.D.) pipe would utilize a 2,400 ft ROC. This is a general "Rule of Thumb" for quick calculations which has been developed over the years based on constructability as opposed to pipe stress limitations. The minimum vertical curve chosen for the proposed HDD is 5,000 ft, which is much larger than the minimum based on the above criteria. This increased design radius has been chosen to assist in ease of steering for the contractor during construction. Applying the design radius, the bending stress and operational shear stress have been calculated to be 13.1% and 48.1%, of allowable, respectively.

An essential part of the design of HDD crossings is providing the contractor with minimum steering tolerances during pilot-hole based on an acceptable level of stress on the pipe. These tolerances are designed to allow the contractor to follow the designated drill path as closely as possible while avoiding any variation that may result in overstressing the product pipe. CCI has calculated the minimum allowable design radius (MADR) for the pipe based on limiting the bending stress to less than 45% of allowable (as per PRCI). For this crossing, an additional design factor has been added to this typical MADR calculation, in order to ensure major variations from the design radius which may negatively affect installation pull-forces are avoided. In addition to the calculated 3-joint minimum allowable design radius (MADR), CCI recommends the additional minimum 1-joint radius specification as shown in Table 4.

Table 4. Minimum Radius Allowances

	Radius Specification
30ft (single-joint)	Minimum ROC – 1,100 ft
100ft Average (3-joint) / MADR	Minimum ROC – 2,000 ft
Design Radius	5,000 ft

If the contractor adheres to these minimum radius specifications, the product pipe will be within allowable stress limits during installation and operation. It should be noted that a recommended single-joint minimum radius has been included, which is sometimes not specified within HDD designs. Without a single-joint radius specification, it is possible that the contractor may be able to include an excessive steer within a single joint, yet still adhere to the provided 3-joint minimum radius average. In order to avoid overstressing of the pipe that may occur in such an instance, adherence to the single-joint radius specification is recommended.

4.7 LAYDOWN AREA

The design proposes that the product pipe be laid out in one (1) continuous section. The proposed pullback workspace is 100 ft wide and crosses an unnamed road and 52nd Street NW (Highway 17A). The proposed pullback alignment also crosses an un-named creek which would likely require two (2) additional side booms to support the pipe from either side of the creek bed. The creek may need to be diverted, bridged, or infilled within the temporary workspace to support machinery traffic and equipment. From an initial desktop study, most of the designated workspace that is planned to be used during pullback will travel through cleared land, so minimal clearing will be required. Near the end of the pullback section, the workspace turns and parallels Co Highway 17A. To accommodate this curve, the pullback includes a 4000 ft radius horizontal curve.

Due to the usage of 52nd Street, it is expected that it will not be possible to close for pullback and it is expected the pipe will be lifted and supported over the road during pullback operations after final welds.

Due to the pipe size, a significant excavation length would be required if the pipe were to be strung under the road in a culvert. The culvert option could be investigated if permission to support the pipe over the road are not granted.

Based on CCI's stress analysis, the minimum allowable overbend radius of the pullback section is roughly 1,600 ft for the NPS 24 pipe. The stress analysis also yielded a maximum crane/side boom support spacing of 80 ft (based on typical roller-cradle capacities) and roller spacing of 40 ft, assuming adequately sized supports will be used. It is also recommended the maximum unsupported overhang not exceed 60 ft. The overbend radius and maximum support spacing was selected to maintain the imposed stress on the product pipe below 80% of allowable stress as per PRCI and with consideration of roller-cradle capacities.

The pullback alignment described above encounters a relatively level topography, with one geographically noticeable hill approximately 2,800 ft north along the pipe stringing alignment. The hill is gradual and should not affect pullback operations. Given the 14° exit angle, the height of the pullback overbend will reach approximately 35 ft above ground surface. This overbend results in approximately 6 cranes and 3 side booms to support the pipe within the overbend.

At the end of the existing 100 ft wide workspace, CCI has proposed an additional 40' of workspace, ending at the road surface of 54th Street NW. This additional workspace is to allow the pipe to be laid out in one section. Due to the topographical elevation changes within the layout, it is expected the pipe will not be as close to the road as is conservatively shown on the Issued for Permit (IFP) HDD design drawing [2386-EG-0102, Rev D, dated July 31, 2020] provided in Appendix A.

5 HDD ENGINEERING ANALYSES

The proposed HDD design has incorporated supplied topographical information, geotechnical information, and ROW alignment. In addition to these considerations, detailed annular pressure analysis and pipe stress analysis calculations have been completed as outlined below.

5.1 ANNULAR PRESSURE MODELING

The annular pressure (AP) was modeled to simulate the downhole pressure during the pilot hole phase of construction and compare it with the limiting pressure of the substrata above the drill path. The AP simulation was conducted with CCI's analysis tools, which have been developed with industry standard calculation models (Bingham Plastic, General Overburden, and USACE/Delft model) and additional modified safety factors based on our experience from over 15,000 completed HDD crossings. CCI developed geotechnical parameters for the crossing that are closely representative of the soil formations observed in the land boring logs and water boring logs completed by GES at the crossing.

Drilling fluid properties, used to model the downhole pressure during drilling, are dependent on construction practices of the HDD contractor, field conditions, and interpretations of the drilling fluid technician. Annular drilling fluid pressures can significantly change with changes in drilling fluid properties. Therefore, it is important to re-evaluate drilling fluid pressures based on fluid properties during HDD operations and compare them with estimated limiting pressures of the formation. Additionally, annular pressure measurement tools should be used to monitor annular pressure during the HDD installation.

The drilling parameters utilized by CCI for this analysis are based on tooling specifications provided by the drilling contractor and are as follows:

- 13 1/2" drill bit (pilot)
- 7 5/8" drill pipe

- 650 gpm (2.5 m^3/min) fluid pump rate
- 9.6 lb/gal fluid density
- 25 lb/100ft^2 yield point of fluid
- 20 cP plastic viscosity of fluid

Calculated expected annular pressure graphs for each drill direction were produced with the above drilling parameters and are modeled in Figure 3 and Figure 4. These annular pressure graphs form the basis for establishing whether a proposed HDD crossing is at risk for hydraulic fracture during the pilot hole phase. This graph shows a calculated expected downhole pressure, as well as an *Operating Zone* above the expected downhole pressure, shown as 125% of the calculated pressure. According to this model, drilling pressures that exceed the overburden fracture pressure do not necessarily indicate a fracture will occur, but rather a higher risk that hydraulic fracture may occur in those areas.

CCI has reviewed and incorporated the geotechnical program laboratory testing results from the geotechnical investigation and developed three geotechnical parameter sets for this crossing. These geotechnical parameter sets represent a “Firm CL-CI Clay” layer at surface, a variable thickness “Compact Sand” layer, and a “Shale Bedrock” layer in which the drill progresses for the majority of the crossing. The Parameters utilized by CCI are listed below.

Firm CL-CI:

- 26° Internal Angle of Friction
- 200 psf Cohesion Coefficient
- 120 pcf Unit weight of Soil
- 0.4 ksi Shear Modulus of the Soil
- Variable Radius of Plastic Zone based on soil parameters

Compact Sand:

- 32° Internal Angle of Friction
- 0 psf Cohesion Coefficient
- 125 pcf Unit weight of Soil
- 2.2 ksi Shear Modulus of the Soil
- Variable Radius of Plastic Zone based on soil parameters

Shale Bedrock:

- 26° Internal Angle of Friction
- 902 psf Cohesion Coefficient
- 131 pcf Unit weight of Bedrock
- 6.7 ksi Shear Modulus of the Bedrock
- Variable Radius of Plastic Zone based on soil parameters

Due to the length of the Missouri River HDD crossing, the crossing will be completed by intersect methodology. Figure 3 and 4 represent the annular pressure curves for the north and south portions of the HDD pilot hole. The Intersect Zone is shown on both drills, and represents the maximum length drilled from either side. The graphs shown are based on a modified CCI Delft equation. The modified Delft equation used here utilizes a smaller Radius of Plastic Zone than the standard Delft equation which results in much lower limiting pressure outputs, equating to more conservative allowable pressures in the curves shown below than would be shown in typical Delft model outputs.

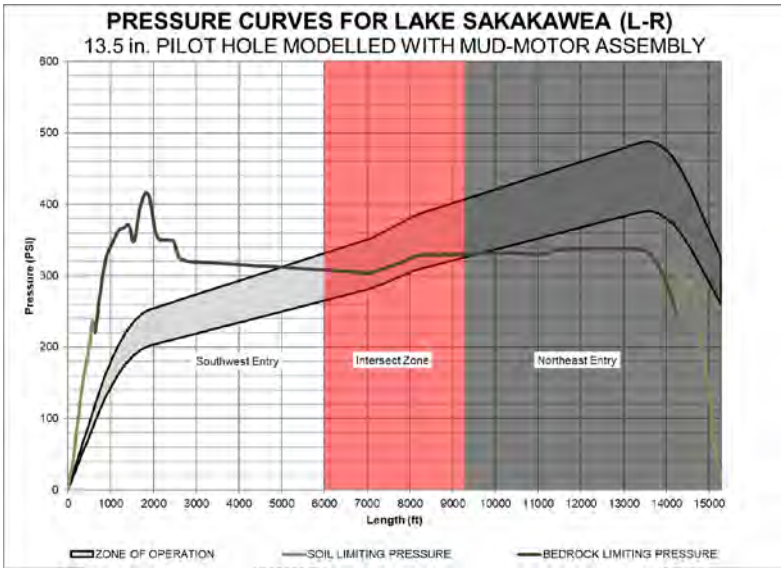

Figure 3. Modeled Annular Pressure During South Pilot Hole

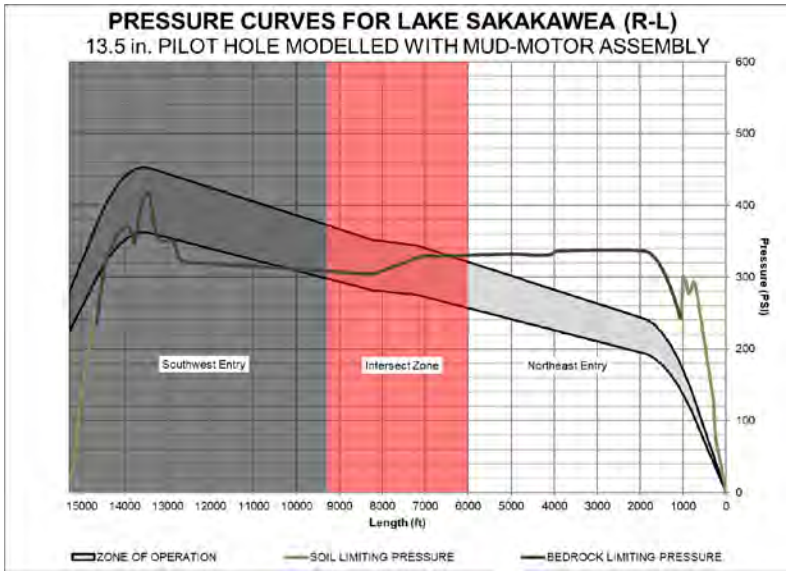

Figure 4. Modeled Annular Pressure During North Pilot Hole

The modified CCI annular pressure graphs above suggest that the drilling pressures remain below the limiting pressures of the overburden along the first 5000-6000 ft of the drill from either side. Within the 5000-8000 ft measured depth range, the lower operating pressures are below or slightly over the limiting over burden pressures. Once past the planned intersect zones, the drilling pressures greatly exceed the overburden pressure, illustrating the need for an intersect based on annular pressure considerations. Within the middle section of the drill, near the intersect zone, the risk of hydraulic fracture for the HDD is moderate.

The annular pressure graphs in Figures 5 and 6, below, have been run using the standard USACE Delft equation. These annular pressure graphs correspond to the factor of safety graphs seen in Figures 7 and 8.

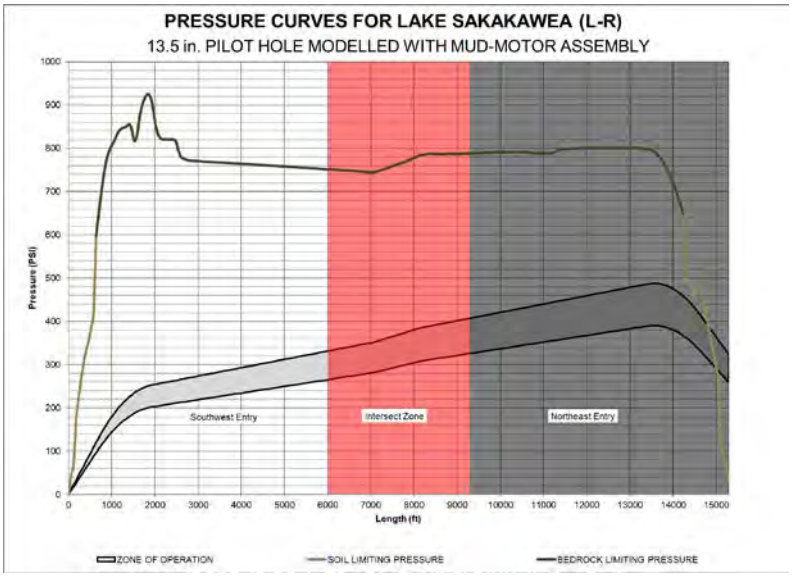

Figure 5. USACE Modeled Annular Pressure During South Pilot Hole

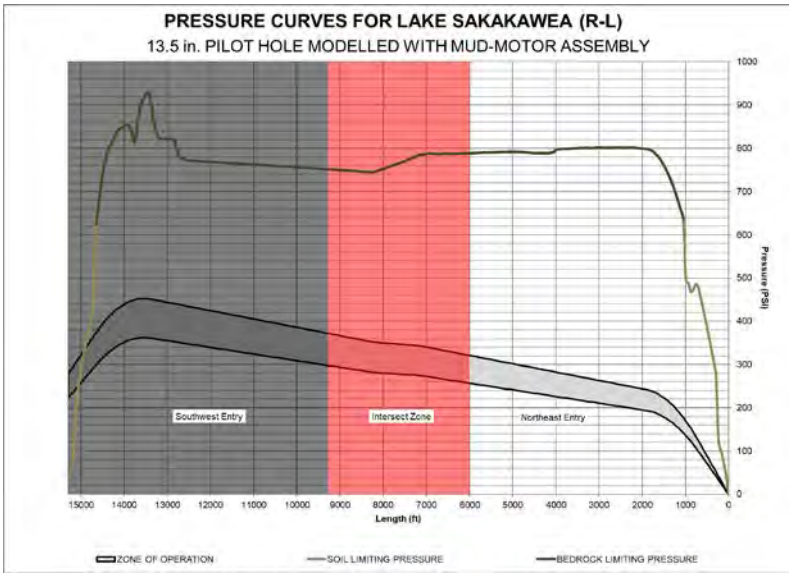

Figure 6. USACE Modeled Annular Pressure During North Pilot Hole

USACE requires a factor of safety against hydraulic fracturing, generally in the 2.0 range, for the portion of the drill passing beneath a regulated waterbody. The factor of safety is calculated by dividing the calculated limiting pressure of the formation by the expected annular pressure along the length of the drill path. Figure 7 and 8 shows the factor of safety against hydraulically fracturing the formation during pilot hole installations utilizing the standard USACE calculation models without any additional factor of safety applied to the equations at the design depth.

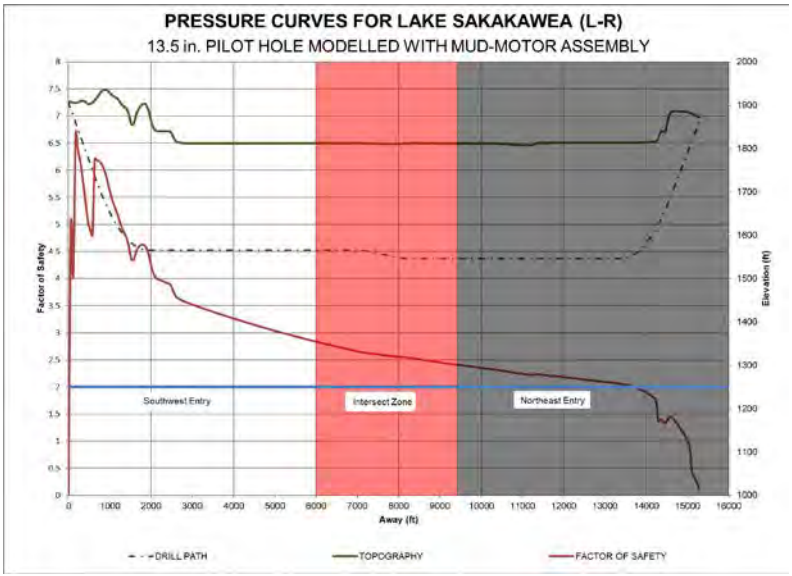

Figure 7. Factor of Safety Against Hydraulic Fracture South Pilot Hole

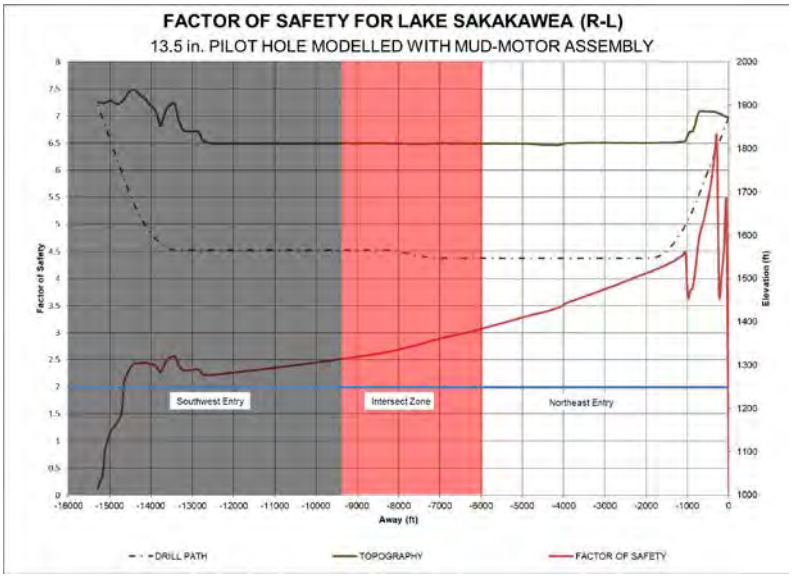

Figure 8. Factor of Safety Against Hydraulic Fracture North Pilot Hole

Figure 7 and 8 indicate that the Factor of Safety (FOS) against hydraulic fracture is above 2.0 for the entire planned pilot hole from the south and north sides. Utilizing USACE calculations, the FOS is roughly 2.5-4 below the Missouri River. Based on the results of the analysis, the HDD design meets the USACE minimum requirements for factor of safety against hydraulic fracture.

During construction, the risk and impact of hydraulic fracture and inadvertent returns (IR) to surface can be reduced by implementing preventative measures during pilot hole. It is recommended that the contractor reduce pump rates as the drills approach the intersect location. It is also recommended that contractor maintain drilling fluid densities at the low end of what is industry standard. An annular pressure

tool should be used during construction to monitor pressures as the drill progresses, avoiding exceeding containment pressures under any critical locations, as required by the USACE. The contractor should review the drilling fluid parameters and tooling and ensure the proposed equipment is in alignment. It may be preferential to utilize a larger drill bit to increase the annular space and decrease the expected pressures.

5.2 HDD STRESS ANALYSIS

The installation and operating conditions imposed on the product pipe during and after installation have been modelled against the respective code requirements as laid out in Section 2. The HDD stress modeling determines if given pipe specifications are adequate for the design.

5.2.1 Pulling Load

To pull the product line inside the borehole, the pull force must overcome several resisting forces including effective weight of the pipe, fluidic drag, frictional drag between the pipe and the borehole walls and between the pipe and the rollers, drag due to length of drill string in the hole, and the reamer assembly in front of the pull section.

The pull force has been calculated with the assumption that the pipe will be installed in one continuous section with no mid-welds as it is suspected there will be sufficient, or nearly sufficient, workspace. It is expected a small section of pipe may need to be pulled into the borehole prior to a single, final weld. This portion of the pipe would be expected to be in the surface casing, and it is not anticipated increased pull forces will be experienced due to this stop near the beginning of pull. If the pipeline installation requires multiple sections beyond this short initial section, the pull forces should be reevaluated to account for the effects of downtime due to intermittent welds during pullback. The soil around the borehole could slough or swell while the pipe remains stationary downhole during the welding process which would result in increased friction on the pipe during pulling.

The calculated expected installation pull force is dependent on the geometry of the HDD, geologic formations present along the drill path, drilling mud properties, and pipe size and weight. CCI has calculated the expected range of pull forces for the product pipe installation, accounting for typical ranges of downhole mud densities. In this analysis, 9.5 ppg (pounds per gallon) drilling fluid is applicable for relatively clean drilling fluid with minimal suspended cuttings, while 12 ppg fluid would be applicable for relatively “dirty” drilling fluid containing significant suspended solids and cuttings. CCI utilizes a safety factor of 1.5 when calculating pull force to account for variations in drilling practices, geology, etc. and addition of the reamer and swivel in the pullback bottom hole assembly. CCI has calculated pull forces for the proposed HDD crossings with and without the additional factor of safety. The calculated pull forces are shown in Table 5. Due to the wall thickness of the product pipe and its associated weight, the pipe is relatively close to neutrally buoyant and therefore buoyancy control is not required for this installation.

Table 5. Pullforce Calculation Analysis

	Drilling Fluid (9.5 ppg)	Drilling Fluid (12 ppg)
Pull force	502,000 lbs	640,000 lbs
Pull force incl. 1.5 x S.F.	752,000 lbs	960,000 lbs

5.2.2 Installation & Operating Stresses

As the pipeline is installed through the final borehole, it is subjected to three primary loading conditions: tension, bending, and external (hoop) pressure. As part of the design process, the individual stresses and their combined effect on the pipe were evaluated to check the pipeline potential for failure.

During operation, the stress imposed on a pipeline installed by HDD is similar to a conventionally installed pipe with the exception of the elastic bending resulting from a continually welded pipeline pulled through a curved borehole. The operating loads including bending, net hoop stress (difference between external and internal pressures), thermal expansion, and combined stresses were checked to evaluate the risk of failure for the NPS 24 product pipe.

The stress analysis completed by CCI based on the design geometry, pipe specifications, and operating conditions for the proposed HDD installation is summarized in Table 6.

A summary of the maximum expected installation and operating stresses and their allowable limits are presented in Appendix B.

Table 6. Installation & Operating Stresses

	Missouri River HDD Crossing	
	Installation Stresses	**% of Allowable (PRCI)**
Maximum Tensile Stress (PRCI 5.1.1, 5.5)	8,935 psi	16.5%
Maximum Bending Stress (PRCI 5.2.2)	5,900 psi	13.1%
Maximum Hoop Stress (PRCI 5.2.3)	2,642 psi	11.3%
Maximum Operating Stress (PRCI 5.4.4.2)	13,000 psi	48.1%
Maximum Combined Installation Stress (tensile and bending) (PRCI 5.2.4)	0.29	29%
Maximum Combined Installation Stress (tensile, bending, and hoop) (PRCI 5.2.4)	0.10	10%

5.2.3 Pipe Lifting Stress Modeling

An analysis was completed to evaluate stresses and imposed loading on the product pipe and supporting equipment during lifting and pullback operations. Minimum support spacing was determined based on pipe specifications and capacity of expected equipment. Summaries of the maximum expected support loading and stresses on the pipe and supports are presented in Appendix B.

The lifting plan requirements including minimum allowable overbend radii, maximum support spacing and maximum allowable overhang to not overstress the pipe or supporting equipment are shown in Table 7. The stresses imposed on the pipeline and loadings on supporting equipment during pullback are also shown. The stress analysis assumes that the pipe is installed empty without buoyancy control.

Table 7. Pullback Support Stresses & Loading

Parameter	
Tensile Stress / % SMYS	10,412 psi / 20%
Bending Stress / % SMYS	18,718 psi / 36%
Combined Tensile & Bending Stress / % SMYS	28,400 psi / 55%
Vertical Load at Support	55,400 lbs
Longitudinal Load At Support	5,540 lbs

Parameter	
Vertical Load at Roller Support	9,700 lbs
Support Spacing	80 ft
Roller Spacing	40 ft
Maximum Unsupported Overhang	60 ft
Overbend Radius	1,600 ft

CCI recommends that designed stresses imposed on the product pipe during pullback are limited to 80% SMYS to account for mishandling in the field during maneuvering and installation. The results from the stress analysis completed for the pullback show that the pipe will be subjected to stresses that are below the recommended limit and are therefore considered acceptable.

CCI recommends that the contractor selects adequately sized lifting equipment and rollers that can handle the expected loadings while providing an adequate factor of safety as per OSHA requirements. CCI recommends that the selected contractor independently evaluate the pullback and pipe lifting plan and account for weather conditions such as snow, rain, and winds to ensure that the equipment and product pipe do not become overloaded or overstressed during pipe handling and pullback.

5.2.4 Design Summary

For this crossing, the operating stresses govern the design of the pipe, and not the installation stresses. Calculations carried out by CCI indicate that the provided pipe specifications are suitable for the HDD installation, based upon the installation and operating conditions supplied.

5.3 HDD CONSTRUCTION RISK ASSESSMENT

The main construction risks and challenges for the Missouri River HDD crossing were identified in the risk assessment conducted by CCI, based on available data and previous experience. The risk items are ranked into the risk categories ranging from low risk to very high risk based on the probability and the consequence of each risk factor.

The descriptions of risk items and a summary of the risk assessment for the crossing detailing the risks prior to any mitigation and after mitigation is presented in Appendix C. The following are major risks and the main mitigation strategies developed.

Casing Installation / Removal:

Casing not Being Installed to Depth

Risk: Geotechnical conditions near surface can pose a problem when driving casing to a designed depth. It is expected both the entry and exit locations will require casing. The entry (south) is expected to be cased to the shale/siltstone bedrock, and the exit location will be cased past the coal layer. The proposed lengths of casing install, although expected to be achievable, are quite considerable.

Mitigation: Achievable casing installation lengths should be investigated prior to construction. The casing should be installed in 160-200ft lengths of telescoped casing. The final casing size shall be 48" and the initial casing should be sized to ensure the final casing will reach the required depth for seating.

Casing Not Being Fully Removed Upon Completion

Risk: Due to the proposed lengths of casing install, the makeup of the subsurface material traversed by the casing, and the expected length of time the casing will remain stationary, there is a risk that the full lengths of casing on either end may not be easily or successfully removed after completion of the product pipe installation.

Mitigation: Contractor shall submit casing plan that includes proper welding specifications to ensure integrity of the casing. Contractor shall also have a mitigation plan for grouting off any portions of casing left below-ground. Owner's integrity management personnel shall evaluate impact of casing left downhole and have a suitable cathodic protection mitigation plan prepared to address any possible related concerns.

Pilot Hole Operations:

Fracture to Water Body

Risk: Fractured formations (including coal seams as identified within the bedrock formation) or high annular pressures could result in release of fluid to surface. The length of the Missouri River crossing results in high pressures due to the building friction forces. The bedrock layer is inconsistent and dips significantly in the middle of the Missouri River, reducing the expected strength of the overburden formation.

Mitigation: The crossing is designed to be completed as an intersect which will limit the expected drilling pressures. The crossing has been designed with significant depth to limit the potential for fracture. Casing will also help with circulation back to entry/exit locations, which should reduce the potential for climbing annular pressures. Contractor shall utilize an Annular Pressure Tool to measure actual downhole pressures during drilling of the pilot hole to ensure any significant increases in pressure beyond planned ranges can be addressed and reduced to within expected ranges with mechanical tripping or additional circulation as applicable.

Large Fluid Loss to the Formation

Risk: Drilling fluid has the potential to migrate outside of the designed drill path in fractures. The crossing location is characterized by several coal seams, including two thick coal seams above and below the bottom tangent of the drill path, which may act as preferential path for drilling fluid.

Mitigation: The drill depth has been chosen to limit the risk of fracture to surface. Casing is included in the design to minimize the amount of coal seams the drill path will encounter. The contractor shall develop a mitigation plan for reducing significant losses where possible, including the use of Loss Circulation Material (LCM) pills to try to plug off any encountered zones of significant fluid loss.

Steering Control Issues

Risk: The crossing is 15,393ft long and each rig will need to drill approximately 7,000 – 8,000 ft. Maintaining weight on bit in order to be able to steer at this length is expected to be difficult, complicating the intersect operations.

Mitigation: The crossing is designed with a large radius which will reduce the steering requirements. The Contractor is utilizing 7 5/8" drill string and gyro steering systems to ensure accuracy and a successful intersect. The bottom tangent is very long and will allow the drills

sufficient time to align for intersect operations. Casing at the entry and exit locations may help to maintain weight on bit.

Annular Pressure Issues

Risk: Drilling operations require soil cuttings to be cleaned out of the bore and hydro-transported back to the rig by the drilling fluid. This process requires large volumes of pressurized drilling fluid to be pumped downhole. The length of the crossing will increase the risk of annular pressure issues.

Mitigation: The Contractor shall maintain returns to both entry pits and monitor annular pressures. A mud engineer shall be on site to monitor adherence to the crossing specific Engineered Drilling Fluid Plan (EDFP). A bottoms up procedure (circulating the calculated amount of fluid that it takes to flow from the bit downhole back up to the entry pit) should be in place and followed when necessary to clean the hole.

Over Schedule Risk

Risk: Geotechnical conditions, permitting, and environmental issues can all contribute to delays in the schedule. The crossing is long with a large borehole size. Over schedule could significantly increase costs. Significant delays could have a large financial impact due to delay to in-service date.

Mitigation: All requirements of the permits should be strictly followed. The Contractor shall ensure proper drilling procedures are in place. Encountered geotechnical conditions should be monitored and reported during drilling so modifications can be made to execution strategy, as required, to ensure no negative impacts. It is recommended construction proceed 24/7 with 2 12hr rotational shifts per day.

Disposal of Drilling Fluid

Risk: Drilling fluid needs to be stored and disposed of. Running out of temporary storage can lead to schedule delays and environmental concerns. The length and large borehole size will result in significant volumes of drilling fluid. Drilling fluid may be contaminated due to coal seams.

Mitigation: Adequate storage should be on site. An EDFP should be followed and an adequate recycling system will be on site. An approved disposal plan should be developed prior to construction. Facility disposal should be expected.

Reaming Operations:

Over Schedule Risk

Risk: Geotechnical conditions, permitting, and environmental issues can all contribute to delays in the schedule. The crossing is long with a large borehole size. Over schedule could significantly increase costs. Significant delays could have a large financial impact due to delay to in-service date.

Mitigation: All requirements of the permits should be strictly followed. The Contractor shall ensure proper drilling procedures are in place. Encountered geotechnical conditions should be monitored and reported during drilling so modifications can be made to execution strategy, as required, to ensure no negative impacts. Using two rigs will split the workload which would be normally be placed upon a single rig.

Loss of Equipment in the Borehole

Risk: Reaming or enlarging the bore to the desired diameter may cause instability areas. These areas may cause downhole tooling to get stuck or lost. Loss of equipment within the borehole is a larger risk than with a shorter crossing.

Mitigation: The utilization of intersect methodology will mitigate the risk of losing equipment within the borehole. Using two rigs will split the workload which would be normally be placed upon a single rig. If problems arise on one side of the reamer, the opposite rig will maintain contact with the downhole tooling and be able to trip to surface. Drill string management plan should be provided by the contractor, which should include regularly switching out drill stem on either side of the reamers.

Poor Removal of Cuttings

Risk: Due to the large ream pass and length a large volume of cuttings will be created and therefore will have to be removed from the borehole.

Mitigation: Drilling fluid parameters will be optimized for maximum cutting transportation, through adherence to the EDFP. High pump rates throughout the ream passes of the HDD will increase the annular velocity and therefore carrying capacity. Additional trips will be necessary to mechanically remove cuttings from the borehole. The number of trips required will be based on the borehole conditions. The cut size should ensure that cuttings can be removed.

Drilling Fluid Control

Risk: As the volume of drilling fluid within the borehole increases, it becomes more difficult to change its properties with drilling fluid additives. The large diameter borehole combined with the length will impact the quality and makeup of the drilling fluid. Coal seams may contaminate drilling fluid. Contractor will be hauling in water.

Mitigation: The Contractor should prepare and adhere to an approved EDFP which will outline the steps required to ensure the highest quality of drilling fluid is used for the crossing. A premix tank should be made available in addition to the mud tank. Contractor should continue to adhere to the EDFP throughout reaming operations even if they are experiencing fluid losses.

Pullback Operations:

Stuck Pipe

Risk: There is a risk that the pipe section becomes stuck in the borehole due to borehole length, instability, blockages, or irregularities. The pullforce for this length is between approximately 502,000 and 960,000lbs.

Mitigation: One or more wiper trips shall be completed to ensure a clean hole. Required force should be monitored during the wiper passes. It is recommended that a Pipe Thruster (with custom inserts for NPS 24) be available on exit side to assist the rig with pullback in the event pullforces start to become exceedingly high.

Pull Forces Exceeding Theoretical Model

Risk: There is a risk that pull forces exceed the theoretical model, especially with the length of the drill. Contributing factors can include cuttings in the borehole, having to temporarily halt line pull, borehole instability, and heavy drilling fluid.

Mitigation: A swab pass should be completed and downtime during installation should be minimized. It is expected pipe pull will continue overnight as required. This should be planned for with crews in advance, lighting shall be sufficient to allow overnight operations for pull. Pipe thruster should be available on exit side to assist the rig will pullback.

Coating Damage

Risk: Gravel, cobbles, boulders, and bedrock interfaces within the bore path pose a risk that the pipe coating is damaged during line pull.

Mitigation: Wiper passes shall be completed to gauge any possible areas of issue, and additional passes may be used to ensure minimized risk prior to pullback. FBE and ARO coated pipe shall be used.

Pipe Handling

Risk: The exit angle, wall thickness, and size of the pipe result in a large radius overbend that reaches a height of 35 ft. The pipe section requires significant support equipment.

Mitigation: A pullback lift plan should be created prior to construction for review and approval. The equipment capacities should be sufficient for the anticipated loads. Spreader bars may reduce crane requirements. A traffic plan should be created for Highway 17A (52nd Street NW) and 54th Street NW (if required).

Pipe Preparation:

Over Schedule Risk

Risk: There is significant support equipment required for pullback. If pullback is delayed this could be a large cost to keep the equipment on site. If the pipe section is not ready for pull the hole could tighten.

Mitigation: A pullback lift plan should be created prior to construction for review and approval. The equipment capacities should be sufficient for the anticipated loads. Spreader bars may reduce crane requirements. A traffic plan should be created for Highway 17A (52nd Street NW) and 54th Street NW (if required). Progress of the HDD should be tracked closely.

Other Risks:

Crossing Length

Risk: The crossing is 15,393ft long, approaching record lengths for an HDD crossing. There is a risk that the crossing could encounter compounding issues that lead to the crossing not being completed successfully.

Mitigation: A competent contractor with adequate tooling and relevant experience with similarly large installations has been selected. The risks should be highlighted to all stakeholders.

Access to Water

Risk: Water sources should be investigated/confirmed. Water transport should be a major consideration.

Mitigation: Additional transport and water sources should be investigated prior to construction. Transport should include contingency to ensure a lack of water does not lead to any delays with progress of the drill, particularly in the event of significant fluid losses during drilling, where large volumes of make-up water may be required.

Public Attention

Risk: Scrutiny is possible in the area. There is a risk of negative public perception issues. The summer season will see high levels of lake use.

Mitigation: The contractor shall ensure all procedures are being followed and their impact is minimized. The contractor shall ensure all correspondence with the public is completed by WBI representation.

6 RECOMMENDATIONS

The following recommendations outline the main action items that should be completed in order to ensure smooth progression of the project into the construction phase:

a) Review of information by all stakeholders and issuance of the Issued for Construction (IFC) drawings incorporating any changes from the Owner, environment, or other consultants.

b) Ensure that all the requirements of the USACE Omaha district are met, and an open line of communication is maintained throughout design and construction.

c) Ensure all required ROW and TWS, environmental notifications and permits, and water withdrawal and disposal sites are acquired.

d) Review the Construction Execution Plan, including but not limited to Pullback Plan, Water Management and Drilling Fluid Disposal Plan, Drilling Rig Anchoring Plan, Casing Plan, and Site-Specific Environmental Plan.

e) Scope of construction inspection, turbidity monitoring and fluid disposal management services should be identified.

f) Review any new environmental concerns with respect to the crossings and develop contingency plans if required.

g) Select an appropriate level of qualified supervision on site for all stages of the drill to ensure that the drill profile is adhered to within the radius limits set forth on the IFC drawing, the proper drilling techniques and equipment are utilized, and schedule and costs are controlled.

h) Select a qualified drilling contractor with experience completing HDD installations of similar size and scope in the area who is familiar with the local geologic formations and associated risks.

7 CONCLUSIONS

This assessment shows the risks identified on the Missouri River NPS 24 HDD crossing and if adequately mitigated, reduces the overall impact on the project. Based on the available data, it is deemed feasible to construct the Missouri River HDD crossing along the proposed North Bakken Expansion Pipeline project

successfully. The crossing is one of the longest HDD crossings completed, and there is potential for an unsuccessful HDD installation, however, this risk will be minimized if the recommendations included within this report are followed.

8 LIMITATIONS

This report has been prepared based on the available site-specific information for the exclusive use of WBI in the construction of the proposed Missouri River HDD crossing. No other warranty is expressed or implied and the information presented within this report shall not be applied to other projects.

Although subsurface conditions are not expected to vary significantly from those shown on the drawings, it should be appreciated that extrapolation of subsurface conditions between boreholes and to depths below the depth of exploration is subject to interpretation and could be at variance with actual field conditions.

Pilot Hole Tolerances	
Item	Tolerance
Pilot Entry Angle	Increase in angle up to 1° (deeper), but no decrease in angle allowed as long as minimum 3-joint bending radius is not compromised.
Pilot Entry Location	As staked by COMPANY. No change without COMPANY approval.
Pilot Exit Angle	Change in angle up to +/-1° allowed as long as minimum 3-joint bending radius is not compromised.
Pilot Exit Location	Up to 40 feet longer or 10 feet shorter than exit stake. Between 10 feet left and 10 feet right of COMPANY survey centerline.
Pilot Depth	Up to 5 feet decrease in design depth (shallower) allowed except under critical areas such as roads, utilities, levees etc. near the entry and exit points. Up to 10 feet increase in depth (deeper) allowed. Best efforts shall be made to stay at or below pipe design profile depth.
Pilot Alignment	Shall remain within 10 feet left or right of COMPANY centerline survey.

NOTES

1. All dimensions are in feet unless otherwise specified. All dimensions are to the centerline of borehole unless otherwise specified.
2. All drill path lengths are rounded to the nearest foot and angles are rounded to the nearest degree, unless otherwise specified.
3. This drawing is based on information provided from various sources. Consulting company does not take responsibility for the accuracy of information provided by others.
4. The crossing shall be constructed in accordance with ASME B31.8 2018.

CONSTRUCTION

5. The estimated theoretical pull force (including safety factor) for this HDD crossing has been calculated to be 752,000 lbs without the consideration of pipeline buoyancy control.
6. Assumed final borehole size is 36".
7. The Contractor shall submit a Drilling Execution Plan for Company approval (prior to start of drilling operations) meeting the minimum requirements of the Contract Documents. Any deviation from the Execution Plan shall only be allowed with Company approval.
8. The Contractor shall verify topographical survey information represented on this drawing in the field prior to construction. Contractor shall inform the Owner of any topographical discrepancies identified.
9. The design drill path and existing utilities being crossed shall have a minimum separation of 10ft.
10. Contractor shall supply and use an approved annular pressure tool capable of operating within the expected pressure range. Annular pressure information provided is based on a mud motor assembly for a 13 1/2" pilot hole.
11. The locations of existing utilities, pipelines and structures shown on the drawing are approximate and shall be verified in the field by the Contractor prior to start of any excavation or pilot hole operations. Verification shall be in accordance with Company specifications and procedures. The Contractor shall ensure any utilities, pipelines and structures in the area are protected and not damaged by the construction.
12. The Contractor shall take specific precautions in protecting existing utilities, pipelines and structures at the entry and exit sites. Such precautions may include: entry/exit pits excavated below existing utilities, casing or sheet piling used to protect pipelines, ramping/matting and special drilling precautions employed during drilling. These precautions shall be used to ensure the drilling tools, pipe and product pipe maintain a safe distance from the existing pipelines, utilities and structures.
13. The Contractor shall assess the need for temporary casing, including both small diameter "wash-over" type casing during pilot hole, and large diameter hammered-in place casing. If large diameter casing is utilized, casing shall be sized to accommodate the final ream pass and shall utilize centralizer casing within the temporary conductor casing. Casing diameter, wall thickness, grade, and drive shoe design shall be determined by the Contractor. A Contractor's Casing Plan shall be submitted and approved by Company prior to casing installation. All temporary casings shall be removed at completion unless otherwise noted.
14. The pilot hole shall be drilled along the design drill path with the designated design radius of curvature shown in the drawing. The pilot hole shall be within the pilot hole tolerances noted on the drawing.
15. The design radius for this crossing is 5000 ft. The pilot hole drilling shall adhere to the following tolerances:
    30ft (single joint) radius shall not be less than 1100 ft
    100ft (3-joint) average radius shall not be less than 2000 ft
16. Crossing to be completed using an intersect methodology utilizing an HDD rig on either side of the crossing. Intersect shall be planned for near the mid-point of the drill geometry in order to ensure minimized risk of drilling fluid release throughout the drill.
17. This engineered design is based on the following minimum equipment requirements that the Contractor shall have onsite:
    a. Drilling Equipment:
    - Drilling Rig with a minimum pull force of 1,000,000 lbs;
    - Drill Pipe 7 5/8" (inspected as per the HDD specification);
    - Drill Bit – 13 1/2" in diameter or larger (provide details, condition, and supplier);
    - 8" Mud Motor or larger capable of running within its specified maximum load range (provide details, condition, and supplier);
    - Annular Pressure Tool (0 to 510 psi range);
    - Reamers designed for the formation (provide manufacturer's operating specifications, condition, and supplier);
    - Gyroscopic steering system;
    - Casing (specifications and details to be provided for approval).

    b. Drilling Fluid Recycling Equipment:
    - Pump Capacity (Operable Rate – 1050 gpm);
    - Shakers (Operable Rate – 1050 gpm);
    - Centrifuge/Desander/Desilter (Minimum Capacity of 1050 gpm);
    - Engineered Drilling Fluid Plan must be able to be implemented in the field with the proposed equipment.

    c. This is a minimum list of equipment and should not be considered a directive on how to complete the work. The Contractor is responsible for the execution of the work under its Approved Execution Plan and shall supply all necessary equipment to complete its plan at its own cost. All equipment shall be supplied in good working order, maintained, fueled and serviced.
18. Drilling Fluid is assumed to have a maximum density of 10 lbs/gallon and 1.0% sand content.

ENVIRONMENTAL

19. Emergency response spill kits must be on-site and available for use for the duration of the project.
20. Terrestrial "inadvertent return walks" shall be initiated every 4hrs. (at a minimum), or immediately following a loss of fluid event.
21. Contractor's proposed drilling fluid composition, including all expected additives, shall be reviewed and approved by the Owner's representative prior to construction.
22. The watercourse must be monitored for a potential release of drilling fluid and to assess the immediate effects of the works on the aquatic environment in accordance with applicable Federal and State regulations.
23. The Contractor shall ensure that the following documentation is on-site and readily available at all times (at a minimum):
    a. Emergency Response Procedure (ERP);
    b. Environmental Protection Plan (EPP);
    c. MSDS for all on-site material;
    d. Copies of Land Use Agreements.

GEOTECHNICAL

24. A land-based geotechnical investigation was completed at this site by Groundwater and Environmental Services, Inc (GES), and can be referenced from the report titled "Geotechnical Investigation Report WBI North Bakken Expansion Project", dated June 14, 2019. A supplemental water-based geotechnical investigation was also completed and can be referenced from the report titled "Geotechnical Investigation Report Water Based Borings", dated July 9, 2020.
25. The soil and bedrock stratigraphy shown is based on interpretation of data from three (3) land-based boreholes, and six (6) water-based boreholes, drilled at the locations shown and the designer's understanding of the local geology. Due to natural variations in subsurface conditions and inherent uncertainties associated with the interpretation of subsurface data, some variation in stratigraphy between boreholes and along the length of the bore should be expected.
26. The Contractor should independently evaluate the crossing with due consideration given to the suitability of its proposed equipment and construction procedures. Proposed construction means and methods shall be submitted to Company for approval but remain the sole responsibility of the Contractor.

PULLBACK NOTES

1. This drawing is engineered and designed to ensure the pipe section is not overstressed during the installation process.
2. This drawing is developed to inform the Contractor of the maximum spacing, anticipated lifting heights, minimum loading requirements and the minimum amount of support equipment to be provided by the Contractor. It is expected that the Pipeline Contractor will choose the type and size of equipment to manage the minimum loads provided.
3. The shown spacing and heights of supports represent a modeled maximum total stress on the pipe (including tension, bending and shear stress at the supports) of 80% of SMYS.
4. The support placement and spacing shown is based on provided topographical survey data. The Contractor shall field fit equipment according to the terrain or other on-site requirements adhering to a maximum spacing provided of 80ft between any two supports.
5. This drawing is based on information provided from various sources. Contractor shall confirm the accuracy of information prior to construction.
6. All loads shown assume that no buoyancy control will be utilized for this pullback.
7. All dimensions are to the bottom of pipe.
8. It is anticipated that all support equipment will utilize roller cradles during the pullback operation. Load capacity of each roller cradle is 56,500lbs (24"-36" roller cradle model). The load capacity shall be confirmed prior to use.
9. Equipment shall be sized with an adequate safety factor (2.0x or greater) to safely handle expected loads and to suit the heights recommended to facilitate the proper radius of curvature. It is expected that extended boom lengths or ramping under the side-booms may be necessary.
10. Shown pipe roller spacing based on roller load capacity of 12,000lbs. Roller spacing shall be adjusted to suit model of roller used.
11. It is the Contractor's responsibility to ensure they have crossing agreements from all utility and pipeline companies in the area where work will be performed overtop or in the vicinity of high pressure pipelines or utilities.
12. Proper padding/ramping above existing lines is required for all areas in which heavy equipment is moved or placed where the equipment may impact these lines.
13. Contractor shall ensure that there is minimal public disturbance and disruption during all parts of the work.
14. Contractor shall be prepared to work with other Contractors in the area.
15. Care shall be taken in manipulating the first and last section of pipe throughout the pullback. The maximum unsupported length at the leading and trailing ends of the pull section shall not exceed 60ft in order to prevent overstressing of the pipe.
16. Contractor shall implement an adequately sized catch off tractor as an anchor when the pipe section involves a slope, horizontal curve and/or a high to low installation. The tractor must be secured to the pipe section in an acceptable manner such as a pull head.
17. Contractor shall consider other factors such as weather conditions (wind, rain, snow, etc.) and site conditions on the pullback operations to ensure a safe lift and installation.
18. Contractor shall secure the load lines on cranes (if required) to the ground to minimize movement of the cradles along the pipe.
19. Contractor to take all precautions to minimize damage to pipe coating during pullback. Any damage to coating shall be repaired as specified in contract documents.
20. Contractor shall modify this plan (as required) to ensure the pipe pull section is sufficiently supported at all times during pullback. Contractor must provide a Pullback Plan for approval by the owner's representative two weeks in advance of commencing the work.
21. For the support design shown, the largest expected forces are:
    Single Cradle Support
    a. Vertical 55,400lbs
    b. Horizontal 95lbs
    c. Longitudinal 5,540lbs
22. The loads on the supports during pullback resolve to three directions; vertical, horizontal and longitudinal. The vertical direction is the weight of the pipe, the horizontal direction results from horizontal curves and the longitudinal direction results from the pipe being pulled through the cradles. A diagram can be seen in the detail to the right.

Date:	2020-07-29
Calculation Description:	Stress Assessment NPS 24 HDD
Applicable Crossings:	Lake Sakakawea - 9.5 lb/gal Fluid

CCI & Associates Inc.

Completed By:	KP	Reviewed By:	JT	Sheet Revision:	R19.1

Pipe Information			Design Criteria				Crossing Characteristics	
Pipe Diameter (in)	Pipe W.T. (in)	Pipe Grade (psi)	MOP (psi)	Max. Operating Temperature (°F)	Installation Temperature (°F)	Design Radius (ft)	Maximum Depth From Entry Location (ft)	HDD Length (ft)
24	0.990	60000	1,480	100	60	5000	361	15393

The pipe section installated stresses are modelled in 5 sections (exit tangent (5), exit arc (4), bottom tangent (3), entry arc (2), entry tangent (1)) incorporating effects of buoyancy, soil friction, curvature, fluidic drag and pipe weight. The calculated stresses are evaluated using the AGA method (PRCI). Operating stresses incorporate hoop, bending, tensile, and thermal expansion.

Variable Definitions:

F_y - Specified Minimum Yield Strength
D - Outer Diameter of Product Pipe
E - Young's Modulus (Steel)
t - Wall Thickness of Product Pipe

Tensile Stress:

			% of Allowable
5	6761.2 psi	**PRCI 5.1.1, 5.5**	12.5%
4	7007.0 psi		**13.0%**
3	6434.7 psi	**Allowable Tensile Stress**	11.9%
2	6758.5 psi	$F_t = (0.9) * F_y$	12.5%
1	6961.7 psi	= 54000 psi	12.9%

Bending Stress:

			% of Allowable
5	295.0 psi	**PRCI 5.2.2**	0.7%
4	5900.0 psi	$f_b = (E/D)/(2R)$	**13.1%**
3	295.0 psi	**Allowable Bending Stress**	0.7%

The pipe pullback is modelled such that the pipe is not over-stressed due to the combination of bending, tensile, and shear stresses throughout the pullback section, both in the spans between supports and at the support locations.
The pullback is also modelled such that the supports are not overloaded with the weight of the pipe at any point during the pipe installation, including as the tailing end passes from support to support.

Definitions:

SMYS - Specified Minimum Yield Strength
Overhang - Where Unsupported Tail End of Pipe Extends Beyond Support

Mud Motor HDD Risk Assessment

No.	Risk/Issue	Type of Risk/Issue		Pre-Mitigation Probability	Pre-Mitigation Consequence	Post-Mitigation Probability	Post-Mitigation Consequence	Review Cost Needed?
Installation of Casing (Entry and Exit Points)								
1a	Casing not Being Installed to Depth	Safety and Health	-	4	3	3	3	Select
		Environment	-	High Risk		Medium Risk		
		Financial	-	**Description**		**Mitigation Strategy**		
		Production/Schedule	-	Geotechnical conditions near surface can pose a problem when driving casing to a designed depth. It is expected both the entry and exit locations will require casing. The entry (south) is expected to be cased to the shale/siltstone bedrock, and the exit location will be cased past the coal layer. The proposed lengths of casing install, although expected to be achievable, are quite considerable.		Achievable casing installation lengths should be investigated prior to construction. The casing should be installed in 160-200ft lengths of telescoped casing. The final casing size shall be 48" and the initial casing should be sized to ensure the final casing will reach the required depth for seating.		
		Reputation	-					
		Business Impact	-					
Pilot Hole								
2a	Fracture to Surface (Entry or exit, whichever poses as the greatest risk)	Safety and Health	-	3	3	3	2	Select
		Environment	Yes	Medium Risk		Medium Risk		
		Financial	Yes	**Description**		**Mitigation Strategy**		
		Production/Schedule	Yes	Granular material near surface can pose a potential risk for drilling fluid to fracture to surface. The crossing is characterized by well graded to poorly graded sand to depths of 20-120ft.		The sand is expected to be stable enough to maintain an open borehole, or cased. The topography near entry and exit is relatively flat and allows the drill to obtain sufficient depth to effectively mitigate the risk of fracture.		
		Reputation	-					
		Business Impact	-					
2b	Fracture to Water Body	Safety and Health	-	3	4	2	4	Select
		Environment	Yes	High Risk		Medium Risk		
		Financial	Yes	**Description**		**Mitigation Strategy**		
		Production/Schedule	Yes	Fractured formations (including coal seams as identified within the bedrock formation) or high annular pressures could result in release of fluid to surface. The length of the Missouri River crossing results in high pressures due to the building friction forces. The bedrock layer is inconsistent and dips fairly significantly in the middle of the Missouri River, reducing the expected strength of the overburden formation.		The crossing is designed to be completed as an intersect which will limit the expected drilling pressures. The crossing has been designed with significant depth to limit the potential for fracture. Casing will also help with circulation back to entry/exit locations, which should reduce the potential for climbing annular pressures. Contractor shall utilize an Annular Pressure Tool to measure actual downhole pressures during drilling of the pilot hole to ensure any significant increases in pressure beyond planned ranges can be addressed and reduced to within expected ranges with mechanical tripping or additional circulation as applicable.		
		Reputation	Yes					
		Business Impact	Yes					
2c	Large Fluid Loss to the Formation (>25% of total volume)	Safety and Health	-	4	3	3	3	Select
		Environment	Yes	High Risk		Medium Risk		
		Financial	Yes	**Description**		**Mitigation Strategy**		
		Production/Schedule	Yes	Drilling fluid has the potential to migrate outside of the designed drill path in fractures. The crossing location is characterized by several coal seams, including two thick coal seams above and below the bottom tangent of the drill path, which may act as preferential path for drilling fluid.		The drill depth has been chosen to limit the risk of fracture to surface. Casing is included in the design to minimize the amount of coal seams the drill path will encounter. The contractor shall develop a mitigation plan for reducing significant losses where possible, including the use of Loss Circulation Material (LCM) pills to try to plug off any encountered zones of significant fluid loss.		
		Reputation	-					
		Business Impact	-					
2d	Unstable Borehole (swelling, broken up, etc.)	Safety and Health	-	3	3	2	3	Select
		Environment	-	Medium Risk		Medium Risk		
		Financial	Yes	**Description**		**Mitigation Strategy**		
		Production/Schedule	Yes	Site conditions have identified granular materials at both entry and exit locations. During drilling operations this material can become unstable and collapse, which may cause reduced returns. Casing has been specified on entry and exit.		The Contractor should monitoring annular pressure and returns to ensure the borehole remains clear of obstructions, if returns slow the Contractor should mechanically clean the hole.		
		Reputation	-					
		Business Impact	-					
2e	Steering Control Issues	Safety and Health	-	5	3	4	3	Select
		Environment	-	High Risk		High Risk		
		Financial	Yes	**Description**		**Mitigation Strategy**		
		Production/Schedule	Yes	The crossing is 15,393ft long and each rig will need to drill 7000ft-8000ft. Maintaining weight on bit in order to be able to steer at this length is expected to be difficult, complicating the intersect.		The crossing is designed with a large radius which will reduce the steering requirements. The Contractor is utilizing 7 5/8" drill string and gyro steering systems to ensure accuracy and a successful intersect. The bottom tangent is very long and will allow the drills sufficient time to align for intersect operations. Casing may help to maintain weight on bit.		
		Reputation	-					
		Business Impact	-					
2f	Annular Pressure Issues	Safety and Health	-	5	3	4	3	Select
		Environment	Yes	High Risk		High Risk		
		Financial	Yes	**Description**		**Mitigation Strategy**		
		Production/Schedule	Yes	Drilling operations require soil cuttings to be cleaned out of the bore and hydro-transported back to the rig by the drilling fluid. This process requires large volumes of pressurized drilling fluid to be pumped downhole. The length of the crossing will increase the risk of annular pressure issues.		The Contractor shall maintain returns to both entry pits and monitor annular pressures. A mud engineer shall be on site to monitor adherence to the crossing specific Engineered Drilling Fluid Plan (EDFP). A bottoms up procedure (circulating the calculated amount of fluid that it takes to flow from the bit downhole back up to the entry pit) should be in place and followed when necessary to clean the hole.		
		Reputation	-					
		Business Impact	-					
2g	Over-Schedule Risk	Safety and Health	-	4	3	3	2	Select
		Environment	-	High Risk		Medium Risk		
		Financial	Yes	**Description**		**Mitigation Strategy**		
		Production/Schedule	Yes	Geotechnical conditions, permitting, and environmental issues can all contribute to delays in the schedule. The crossing is long with a large borehole size. Over schedule could significantly increase costs. Significant delays could have a large financial impact due to delay to in-service date.		All requirements of the permits should be strictly followed. The Contractor shall ensure proper drilling procedures are in place. Encountered geotechnical conditions should be monitored and reported during drilling so modifications can be made to execution strategy, as required, to ensure no negative impacts. It is recommended construction proceed 24/7 with 2 12hr rotational shifts per day.		
		Reputation	-					
		Business Impact	-					
2h	Disposal of Drilling Fluid	Safety and Health	-	4	3	3	3	Select
		Environment	Yes	High Risk		Medium Risk		
		Financial	Yes	**Description**		**Mitigation Strategy**		
		Production/Schedule	Yes	Drilling fluid needs to be stored and disposed of. Running out of temporary storage can lead to schedule delays and environmental concerns. The length and large borehole size will result in significant volumes of drilling fluid. Drilling fluid may be contaminated due to coal seams.		Adequate storage should be on site. An EDFP should be followed and an adequate recycling system will be on site. An approved disposal plan should be developed prior to construction. Facility disposal should be expected.		
		Reputation	-					
		Business Impact	-					
2i	Water Ingress to Borehole	Safety and Health	-	3	3	2	2	Select
		Environment	-	Medium Risk		Low Risk		
		Financial	Yes	**Description**		**Mitigation Strategy**		
		Production/Schedule	Yes	Ground water tends to migrate to where soil has been cut/ displaced. Coal seams may provide preferential paths for water ingress into the borehole. The ingress of water may dilute the bentonite drilling fluid and reduce the carrying capacity.		The crossing is level and the hole will be full of drilling fluid. Since the identified seams are below rig elevation, it is anticipated that the hydrostatic pressure of the drilling fluid will minimize water ingress to a manageable range.		
		Reputation	-					
		Business Impact	-					
Reaming Operations								
3a	Unstable Borehole	Safety and Health	-	3	3	2	3	Select
		Environment	-	Medium Risk		Medium Risk		
		Financial	Yes	**Description**		**Mitigation Strategy**		
		Production/Schedule	Yes	Site conditions have identified granular materials at both entry and exit locations. During drilling operations this material can become unstable and collapse, which may cause reduced returns.		The Contractor should monitoring annular pressure and returns to ensure the borehole remains clear of obstructions, if returns slow the Contractor should mechanically clean the hole. Adequate pumps for the ream size and length should be on site.		
		Reputation	-					
		Business Impact	-					
3b	Over-Schedule Risk	Safety and Health	-	4	3	3	2	Select
		Environment	-	High Risk		Medium Risk		
		Financial	Yes	**Description**		**Mitigation Strategy**		
		Production/Schedule	Yes	Geotechnical conditions, permitting, and environmental issues can all contribute to delays in the schedule. The crossing is long with a large borehole size.		All requirements of the permits should be strictly followed. The Contractor shall ensure proper drilling procedures are in place. Geotechnical conditions should be monitored and reported during drilling so modifications can be made to execution strategy, as required, to ensure no negative impacts. Using two rigs will split the workload which would be normally be placed upon a single rig.		
		Reputation	-					
		Business Impact	-					
		Safety and Health	-	3	4	3	3	Select
		Environment	-	High Risk		Medium Risk		

3c	Loss of Equipment in Borehole	Financial	Yes	Description			Mitigation Strategy		
		Production/Schedule	Yes	Reaming or enlarging the bore to the desired diameter may cause instability areas. These areas may cause downhole tooling to get stuck or lost. Loss of equipment within the borehole is a larger risk than with a shorter crossing.			The utilization of intersect methodology will mitigate the risk of losing equipment within the borehole. Using two rigs will split the workload which would be normally be placed upon a single rig. If problems arise on one side of the reamer, the opposite rig will maintain contact with the downhole tooling and be able to trip to surface. Drill string management plan should be provided by the contractor, which should include regularly switching out drill stem on either side of the reamers.		
		Reputation	Yes						
		Business Impact	-						
3d	Poor Removal of Cuttings	Safety and Health	-	4	4		3	4	Select
		Environment	-	High Risk			High Risk		
		Financial	Yes	Description			Mitigation Strategy		
		Production/Schedule	Yes	Due to the large ream pass and length a large amount of cuttings will be created and therefore will have to be removed from the borehole.			Drilling fluid parameters will be optimized for maximum cutting transportation, through adherence to the EDFP. High pump rates throughout the ream passes of the HDD will increase the annular velocity and therefore carrying capacity. Additional trips will be necessary to mechanically remove cuttings from the borehole. The number of trips required will be based on the borehole conditions. The cut size should ensure that cuttings can be removed.		
		Reputation	-						
		Business Impact	-						
3e	Drilling Fluid Control	Safety and Health	-	4	4		3	3	Select
		Environment	-	High Risk			Medium Risk		
		Financial	Yes	Description			Mitigation Strategy		
		Production/Schedule	Yes	As the volume of drilling fluid within the borehole increases, it becomes more difficult to change its properties with drilling fluid additives. The large diameter borehole combined with the length will impact the quality and makeup of the drilling fluid. Coal seams may contaminate drilling fluid. Contractor will be hauling in water.			The Contractor should prepare and adhere to an approved EDFP which will outline the steps required to ensure the highest quality of drilling fluid is used for the crossing. A premix tank should be made available in addition to the mud tank. Contractor should continue to adhere to the EDFP throughout reaming operations even if they are experiencing fluid losses.

Pullback Operations									
4a	Pipe Section Gets Stuck in Borehole	Safety and Health	-	3	4		2	4	Select
		Environment	-	High Risk			Medium Risk		
		Financial	Yes	Description			Mitigation Strategy		
		Production/Schedule	Yes	There is a risk that the pipe section becomes stuck in the borehole due to borehole length, instability, blockages, or irregularities. The pullforce for this length is between approximately 502,000 and 960,000lbs.			One or more wiper trips shall be completed to ensure a clean hole. Required force should be monitored during the wiper passes. It is recommended that a Pipe Thruster (with custom inserts for NPS 24) be available on exit side to assist the rig with pullback in the event pullforces start to become exceedingly high.		
		Reputation	-						
		Business Impact	-						
4b	Pull Forces Exceed Theoretical Model	Safety and Health	-	3	4		2	3	Select
		Environment	-	High Risk			Medium Risk		
		Financial	-	Description			Mitigation Strategy		
		Production/Schedule	-	There is a risk that pull forces exceed the theoretical model, especially with the length of the drill. Contributing factors can include cuttings in the borehole, having to temporarily halt line pull, borehole instability, and heavy drilling fluid.			A swab pass should be completed and downtime during installation should be minimized. It is expected pipe pull will continue overnight as required. This should be planned for with crews in advance, lighting shall be sufficient to allow overnight operations for pull. Pipe thruster should be available on exit side to assist the rig will pullback.

		Business Impact	-						
4c	Coating Damaged during Installation	Safety and Health	-	4	3		3	3	Select
		Environment	-	High Risk			Medium Risk		
		Financial	Yes	Description			Mitigation Strategy		
		Production/Schedule	Yes	Gravel, cobbles, boulders, and bedrock interfaces within the bore path pose a risk that the pipe coating is damaged during line pull.			Wiper passes shall be completed to gauge any possible areas of issue, and additional passes may be used to ensure minimized risk prior to pullback. FBE and ARO coated pipe shall be used.		
		Reputation	-						
		Business Impact	-						
4d	Product Pipe is Damaged during Installation	Safety and Health	-	2	4		1	4	Select
		Environment	-	Medium Risk			Medium Risk		
		Financial	Yes	Description			Mitigation Strategy		
		Production/Schedule	Yes	If the borehole has any ledges (intersect location or bedrock interface), the pipe could get hung up or scratched on these ledges resulting in pipe damage.			Ledges shall be reamed/smoothed out prior to product pipe installation. The intersect should be completed as straight as possible to reduce the potential for a ledges where the bits meet.		
		Reputation	Yes						
		Business Impact	-						
4e	Pipe Handling on Exit	Safety and Health	Yes	4	3		3	3	Select
		Environment	-	High Risk			Medium Risk		
		Financial	Yes	Description			Mitigation Strategy		
		Production/Schedule	Yes	The exit angle, wall thickness, and size of the pipe result in a large radius overbend that reaches a height of 35 ft. The pipe section requires significant support equipment.			A pullback lift plan should be created prior to construction for review and approval. The equipment capacities should be sufficient for the anticipated loads. Spreader bars may reduce crane requirements. A traffic plan should be created for Highway 17A (52nd Street NW) and 54th Street NW (if required).

1 Introduction

This report presents the results of the geotechnical investigation that was performed by Groundwater and Environmental Services, Inc. (GES) for the project known as the WBI North Bakken Expansion Project in western North Dakota. Specifically, this report covers the geotechnical exploration at 3 land-based soil borings located along the proposed horizontal directional drilling (HDD) pipeline project under Lake Sakakawea/Missouri River (**Figure 1**). The proposed pipeline alignment under Lake Sakakawea is located approximately 1 mile northeast of the Tobacco Garden Creek Bay Area (TGCBA). The TGCBA is located approximately 23 miles northeast of Watford City, North Dakota.

Services for this investigation were performed in general accordance with the April 1, 2019 Services Contract by and between CCI and Associates, Inc. (CCI) and GES.

1.1 Project Location and Scope

The objective of this phase of the geotechnical investigation is to assist CCI with evaluating the subsurface conditions at 3 land-based boring locations (LB-1 through LB-3) located along the proposed HDD pipeline alignment on the north and south sides of Lake Sakakawea.

The scope of work included the following:

- Prepare a site-specific health and safety plan for GES employees and subcontractors for the proposed geotechnical investigation activities.
- Coordinate field activities and communication with project team and CCI.
- Arrange for utility clearance through North Dakota One Call.
- Mobilize our drilling project team to the project including Interstate Drilling Services, LLP (IDS) and GES personnel.
- Advance 3 land-based soil borings and collect samples at designated locations surveyed by a CCI subcontractor.
- Contract laboratory tests on soil samples obtained from the 3 land-based soil borings to evaluate physical properties.
- Provide a written geotechnical report.

2 Methods

2.1 Soil Borings

As part of the geotechnical investigation, GES contracted with IDS of Grand Forks, North Dakota, to advance the 3 land-based soil borings (**Figure 1**). IDS used a Diedrich D-50 track-mounted drill rig to advance the borings and collect soil samples.

The drilling rig, equipment and supplies mobilized to the project location on April 23, 2019. Advancement of soil boring LB-1 began on April 24 and the last soil boring LB-3 was completed on May 5, 2019. The drilling operation consisted of one crew working 12-hour shifts. Borehole locations for LB-1 through LB-3 were provided by CCI and are provided in **Table 1**.

Soil borings LB-1, LB-2, and LB-3 were completed to depths of 403 feet, 400 feet, and 370 feet below grade, respectively. Hollow-stem auger (HSA) boring methodology was used to collect soil samples while boring through unconsolidated sediment in the upper portion of each soil boring. Once competent sediment was encountered, a closed loop, fluid rotary drilling methodology was used to advance the borings. Rock coring drilling methodology was used at each boring for the last, approximately 200+ feet (to boring terminus). Upon completion, each boring was sealed from the boring terminus to ground surface with a concrete/bentonite slurry through a tremie rod. Drilling cuttings and sediment were thin spread at each boring location.

During HSA and fluid rotary drilling methodology, 1.5-foot samples were collected at 5 foot intervals using a split-spoon sampler in accordance with American Society for Testing and Materials (ASTM) D1586 (*Standard Test Method for Standard Penetration Test [SPT] and Split-Barrel Sampling of Soils*) using a 2-inch diameter split-spoon sampler. During rock coring drilling methodology, samples were generally collected at 5-foot sample intervals continuously in accordance with ASTM D2113 (*Standard Practice for Rock Core Drilling and Sampling of Rock for Site Exploration*) using a using a NQ3 size, triple-tube core barrel with a diamond bit.

Soils were classified in the field by a GES field geologist using ASTM Visual-Manual procedures (ASTM D2488, *Standard Practice for Description and Identification of Soils [Visual-Manual Procedure]*). The field geologist also collected samples from the split-spoon sampler and rock core sampler for geotechnical laboratory testing.

The boring logs and standard boring classification guidelines are contained in **Appendix A**. Photographic documentation of the project is provided in **Appendix B.**

2.2 Laboratory Testing

GES contracted with Material Testing Services, LLC (MTS) of Minot, North Dakota to provide geotechnical laboratory testing and evaluation services to aid in classifying and evaluating the physical properties of the soil/rock samples. Soil/rock sample selection and laboratory test parameters were determined by CCI.

The laboratory testing included the following:

- Moisture Content (ASTM D4959 - Standard Test Method for Determination of Water Content of Soil by Direct Heating and D4643 - Standard Test Method for Determination of Water Content of Soil and Rock by Microwave Oven Heating).
- Sieve Analysis (ASTM D422 – Test Method for Particle-size Analysis of Soils).
- Atterberg Limits (ASTM D4318 - Standard Test Methods for Liquid Limit, Plastic Limit, and Plasticity Index of Soils).
- Unconfined Compression Testing (ASTM D2166 – Standard Test Method for Unconfined Compressive Strength of Cohesive Soils).

Test results are summarized in **Table 2** with the exception of the unconfined compression test results, which are provided with the laboratory reports in **Appendix C.**

3 Site Conditions

The proposed HDD pipeline crossing traverses southwest to northeast across Lake Sakakawea approximately 1 mile northeast of the TGCBA. The physiographic regions where the proposed HDD pipeline crossing is located consist of the McKenzie Upland Unit, located southwest of the Missouri River and the Coteau Slope Unit, located northeast of the Missouri River. These units are part of the Great Plains and are characterized by rolling to hilly plains with both erosional and glacial landforms. The proposed HDD crossing is located within the historic Missouri River floodplain that was flooded with the construction of the Garrison Dam in 1956 to form Lake Sakakawea. This area is located in the central portion of the Williston Basin.

The surface geology in the area consists of thin layers of glacial deposits underlain by the Tertiary-Aged Sentinel Butte Formation and Bullion Creek Formation. The Sentinel Butte Formation consists of layers of silt, clay, sand, lignite, carbonaceous shale, and mudstone (Carlson, 1985). The Bullion Creek Formation underlies the Sentinel Butte Formation and consists of yellowish layers of silt, clay, and sand with interbedded sandstone, lignite, baked clay, and limestone (Bluemle, 1977). Both formations form rolling topography over broad areas and has been eroded to badlands near rivers.

Soil borings LB-1 through LB-3 generally consisted of well graded to poorly graded sand in the upper portion of the borings. The well graded to poorly graded sand was logged from the ground surface to a depth of approximately 25 feet below grade at LB-1 and from the ground surface to approximately 120 feet below grade at LB-2 and LB-3. Underlying the sand, silt, clay (lean and fat), weathered shale, and silty sand were logged. Underlying the sand, lignite (laminations to layers >20 feet thick) were logged throughout each boring to boring terminus. Saturated conditions were only encountered at boring LB-3, at 24.5 feet below grade.

4 Limitations

The data generated and conclusions and opinions provided are based on the scope of work performed. All work was conducted in a manner consistent with currently accepted geotechnical

engineering practices exercised by members of the profession practicing under similar conditions. No other warranty, expressed or implied, is made.

The samples collected and described in this report are representative of the subsurface conditions at the sampled locations and intervals, and therefore, do not necessarily reflect strata variations that may exist between sampled intervals and locations. If variations from the subsurface conditions described in this study are noted during additional investigations and/or construction, recommendations in this report must be re-evaluated.

GES is not responsible for the independent conclusions, opinions, or recommendations made by others based on the data presented in this report. Nor can GES warrant that this report will satisfy the dictates of or provide a legal defense in connection with an environmental law or regulation.

The results reported and any opinions reached by GES are for the benefit of the CCI & Associates and their client and unless agreed to by GES in writing, are not to be disclosed to or relied upon by any third party. The results and opinions set forth by GES in this report will be valid as of the date of the report.

Notes:
SS = Split Spoon
RC = Rock Core
Per MTS, some moisture content tests were not conducted because of lignite or moisture was done with the Atterberg Limit Testing.

Appendix A – Boring Logs

SOIL BORING LOG

Groundwater & Environmental Services, Inc.

ID NO. **LB-1**

Project: **WBI North Bakken Exp. Proj. Lake Sakakawea, ND** Client: **CCI & Associates Inc.**

Address: **NA** GES Job #: **3502056**

County: **McKenzie** GES Project Mgr: **Rob Jenson**

Logged By: **Nick Schlagel** Date Drilled: **4/24/19 through 4/28/19** Soil Classification System: **USCS**

Drilling Company: **Interstate Drilling Services** Completion Date: **4/28/19**

Drill Operator: **Jared Zak** Drilling Method: **HSA (0 to 25 ft.), Fluid Rotary (25 to 185 ft.), NQ Rock Core (185 to 403 ft.)**

Drill Rig Type: **Diedrich D50** Sampling Method: **Split Spoon & NQ Rock Core**

Borehole Diameter: **8 in. to 4 in.** Surface Elevation: **1,908 ft. msl** Abandonment Method: **Tremie**

Total Depth: **403 ft.** Approximate Water Depth: **Not Encountered** Backfill Material: **Portland Cement**

Refusal Depth: **NA** Abandonment Completion Date: **4/28/19**

Depth (feet)	Sample Interval	Recovery (inches)	Blows / RQD (1 100)	Geologic Description	Qp /Qu	Atterbergs PL	Atterbergs LL	Atterbergs PI	G	S	M/C
0				SW: WELL GRADED SAND, fine to medium grained, with trace silt, pale brown (10YR 6/3), moist, medium dense.							
5	1	11 in.	7-7-6		-						
10	2	12 in.	8-5-4	Color changes to light yellowish brown (10YR 6/4) and loose at 9.5 ft.	-						
15	3	18 in.	5-3-4	CL: LEAN CLAY, with trace silt, brownish yellow (10YR 6/6), moist, medium stiff.	0.5						
20	4	13 in.	7-5-8	SW: WELL GRADED SAND, fine to medium grained, pale brown (10YR 6/3), moist, medium dense.	-						
25	5	17 in.	5-10-13	ML: SILT, light yellowish brown (2.5Y 6/3), moist, medium dense.	-						

Notes:

Soil Lithologies based on field observations and laboratory analysis.

NA = not applicable; fbg. = feet below grade; in. = inches; ft. = feet; msl = mean sea level

Qp/Qu = unconfined compressive strength (tons / square foot); G = Gravel Content (%)

PL = Plastic Limit (%); LL = Liquid Limit (%); PI = Plasticity Index (%); S = Sand Content (%)

M/C = Silt or Clay Content (%); Blows = blows per 6 inches; RQD = rock quality index (%)

UNIFIED SOIL CLASSIFICATION SYSTEM

UNIFIED SOIL CLASSIFICATION AND SYMBOL CHART

COARSE-GRAINED SOILS (more than 50% of material is larger than No. 200 sieve size.)			
GRAVELS More than 50% of coarse fraction larger than No. 4 sieve size	Clean Gravels (Less than 5% fines)	GW	Well-graded gravels, gravel-sand mixtures, little or no fines
		GP	Poorly-graded gravels, gravel-sand mixtures, little or no fines
	Gravels with fines (More than 12% fines)	GM	Silty gravels, gravel-sand-silt mixtures
		GC	Clayey gravels, gravel-sand-clay mixtures
SANDS 50% or more of coarse fraction smaller than No. 4 sieve size	Clean Sands (Less than 5% fines)	SW	Well-graded sands, gravelly sands, little or no fines
		SP	Poorly graded sands, gravelly sands, little or no fines
	Sands with fines (More than 12% fines)	SM	Silty sands, sand-silt mixtures
		SC	Clayey sands, sand-clay mixtures
FINE-GRAINED SOILS (50% or more of material is smaller than No. 200 sieve size.)			
SILTS AND CLAYS Liquid limit less than 50%		ML	Inorganic silts and very fine sands, rock flour, silty of clayey fine sands or clayey silts with slight plasticity
		CL	Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, silty clays, lean clays
		OL	Organic silts and organic silty clays of low plasticity
SILTS AND CLAYS Liquid limit 50% or greater		MH	Inorganic silts, micaceous or diatomaceous fine sandy or silty soils, elastic silts
		CH	Inorganic clays of high plasticity, fat clays
		OH	Organic clays of medium to high plasticity, organic silts
HIGHLY ORGANIC SOILS		PT	Peat and other highly organic soils

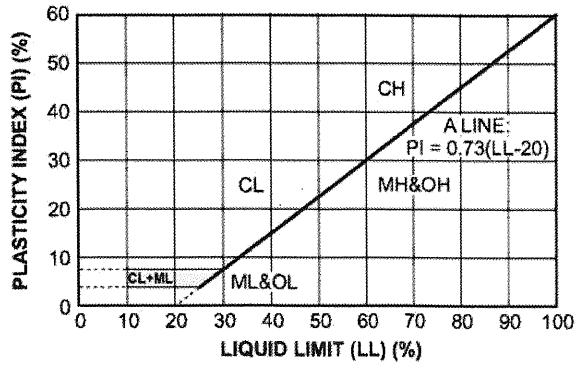
LABORATORY CLASSIFICATION CRITERIA

GW	$C_u = \frac{D_{60}}{D_{10}}$ greater than 4; $C_c = \frac{D_{30}}{D_{10} \times D_{60}}$ between 1 and 3	
GP	Not meeting all gradation requirements for GW	
GM	Atterberg limits below "A" line or P.I. less than 4	Above "A" line with P.I. between 4 and 7 are borderline cases requiring use of dual symbols
GC	Atterberg limits above "A" line with P.I. greater than 7	
SW	$C_u = \frac{D_{60}}{D_{10}}$ greater than 4; $C_c = \frac{D_{30}}{D_{10} \times D_{60}}$ between 1 and 3	
SP	Not meeting all gradation requirements for GW	
SM	Atterberg limits below "A" line or P.I. less than 4	Limits plotting in shaded zone with P.I. between 4 and 7 are borderline cases requiring use of dual symbols.
SC	Atterberg limits above "A" line with P.I. greater than 7	

Determine percentages of sand and gravel from grain-size curve. Depending on percentage of fines (fraction smaller than No. 200 sieve size), coarse-grained soils are classified as follows:

Less than 5 percent ..... GW, GP, SW, SP
More than 12 percent ..... GM, GC, SM, SC
5 to 12 percent ..... Borderline cases requiring dual symbols

PLASTICITY CHART



LABORATORY TEST RESULTS

Testing Scope

Laboratory testing was proposed to characterize soils index properties including Atterberg limits (liquid and plastic limits) and moisture content. Strength testing included unconfined compression testing.

Index Properties

Testing and classification of soils was performed in accordance with the Unified Soil Classification System as described in ASTM D 2487. Atterberg limits were performed according to ASTM D 4318. Moisture content was determined in accordance with ASTM D 4959 and D 4643. The dry density was determined with direct measurement procedures. Mechanical sieve analysis was done in accordance with ASTM D 422.

Strength Testing

The strength tests consisted of unconfined compression (QU) testing. The QU tests were conducted in accordance with ASTM D 2166.

1 Introduction

This report presents the results of the geotechnical investigation that was performed by Groundwater and Environmental Services, Inc. (GES) for the project known as the WBI North Bakken Expansion Project in western North Dakota. Specifically, this report covers the geotechnical exploration at 6 water-based soil borings located along the proposed horizontal directional drilling (HDD) pipeline project under Lake Sakakawea/Missouri River (**Figure 1**). The proposed pipeline alignment under Lake Sakakawea is located approximately 1 mile northeast of the Tobacco Garden Creek Recreation Area (TGCRA). The TGCRA is located approximately 23 miles northeast of Watford City, North Dakota.

Services for this investigation were performed in general accordance with the April 1, 2019 Services Contract by and between CCI and Associates, Inc. (CCI) and GES.

1.1 Project Location and Scope

The objective of this phase of the geotechnical investigation is to assist CCI with evaluating the subsurface conditions at 6 water-based boring locations (WB-4 through WB-9) located along the proposed HDD pipeline alignment in Lake Sakakawea.

The scope of work included the following:

- Prepare a site-specific health and safety plan for GES employees and subcontractors for the proposed geotechnical investigation activities.
- Coordinate field activities and communication with project team and CCI.
- Participate in a pre-construction meeting with the Garrison Project Natural Resource Office of the US Army Corp of Engineers (USACE), TGCRA stakeholders, GES project team and WBI Energy representatives.
- Arrange for an inspection of all equipment entering the Lake by the North Dakota Game and Fish Department (NDGFD). Provide proof that equipment has been cleaned of aquatic nuisance species, mud, standing water and aquatic vegetation.
- Arrange for utility clearance through North Dakota One Call.
- Install crane mat protection along shoreline at barge assembly area located within the TGCRA.
- Mobilize the drilling team (Interstate Drilling Services, LLP (IDS)) and assembly and deploy the barge.
- Advance 6 water-based soil borings and collect samples at designated locations
- Clean barge sections and boats during final demobilization.

- Contract laboratory tests on soil samples obtained from the 6 water-based soil borings to evaluate physical properties.
- Provide a written geotechnical report.

Photographs taking during the project are provided in **Appendix A.**

2 Methods

2.1 Soil Borings

GES contracted with IDS of Grand Forks, North Dakota, to assemble the barge and advance the 6 water-based soil borings (**Figure 1**). IDS used a Diedrich D-50 track-mounted drill rig to advance the borings and collect soil samples.

The barge was deployed at the TGCRA at a location adjacent to the north side of the low-water boat ramp. Prior to deployment, crane mats, consisting of wood timbers were placed on the beach from the gravel driveway to approximately 5 feet from the water line in order to allow the crane to drive down to the water's edge while protecting the beach area and bank from damage. A 6" wattle was placed along the lake shore between the crane pad and water for erosion protection. The crane pad location is provided on **Figure 2**.

The crane pad was installed on May 4, 2020 and the crane, barge sections, push boat, drilling rig, equipment and supplies were mobilized to the TGCRA on May 5th.

Prior to placing into the lake, the barge sections and push-boat were power-washed and inspected for aquatic nuisance species by the NDGFD, per the USACE Permit DACW45-3-17-8010. A copy of the inspection is provided in **Appendix B**. Once approved by the NDGFD, the barge sections were placed into the lake and assembled. The barge consisted of six 10'x40' sections. Loading of the drilling rig, equipment and supplies onto the barge was completed on May 6th.

The barge was directed over the boring locations with assistance from Erickson Contract Surveying, Inc. (ECS) of Sidney, Montana. The boring locations were located via boat using a handheld GPS system and then demarcated with a 14" diameter red buoy. The buoys were deployed approximately 50 feet from the proposed pipeline alignment. Once the barge reached the buoy, ECS personnel collected a second measurement of the actual boring location. The borehole locations and mudline elevations using North Dakota – North, State Plane datum (NAD 83, 2011) are provided in **Table 1**. The water elevation for Lake Sakakawea during the project was generally stable at approximately 1,841 feet (NAVD88).

Table 1 - Borehole Locations					
Bore Hole	Easting	Northing	Mudline Elevation (feet)	Latitude	Longitude
WB-4	1335963.13	420346.33	1,811.7	N48°07'23.30"	W103°05'25.93
WB-5	1336623.75	422154.16	1,811.7	N48°07'42.24"	W103°05'15.52
WB-6	1337159.16	424253.25	1,811.9	N48°08'02.38"	W103°05'10.74
WB-7	1337758.65	425801.28	1,811.7	N48°08'17.93"	W103°05'01.65
WB-8	1338402.89	428621.66	1,812.7	N48°08'45.61"	W103°04'53.93
WB-9	1338983.19	430083.96	1,813.0	N48°09'00.54"	W103°04'45.07

Borehole advancement began on May 6, 2020 and the last boring was completed on the evening of May 16, 2020. The drilling operation consisted of 2 crews each working 12-hour shifts on the 24-hour operation. Work stoppages, due to high wind conditions occurred on May 8th, May 9th, May 12th and May 13th.

A hollow-stem auger (HSA) was used to collect soil samples while boring through soft lake sediment. Once competent sediment was encountered; a closed loop, fluid rotary drilling method was used to advance the borings through the sediments. Rock coring drilling methodology was then used to reach each boring terminus.

All borings were advanced to a total depth of 300 feet below the lake mudline except for WB-7 which was advanced to 315 feet and WB-9 which was advanced to 310 feet below the mudline. Upon completion, each boring was sealed from the boring terminus to the lake mudline with a concrete/bentonite slurry through a tremie rod.

During the fluid rotary drilling process, the spent drilling fluid was captured and run through a Mud Puppy 255 that removed drill cutting sand and grit from the drilling fluid, allowing the drilling fluid to be returned to the drilling operation. This process greatly reduced overall waste generation during the drilling process. Drilling cuttings and sediment were containerized for disposal and transported to the Grand Forks Landfill (Permit IT-202) located at 2701 North 69th Street, Grand Forks, North Dakota.

During HSA and fluid rotary methodologies, 1.5-foot samples were collected at 5 foot intervals using a split-spoon sampler in accordance with American Society for Testing and Materials (ASTM) D1586 (*Standard Test Method for Standard Penetration Test [SPT] and Split-Barrel Sampling of Soils*) using a 2-inch diameter split-spoon sampler. During rock coring drilling methodology, samples were generally collected at 5-foot sample intervals continuously in accordance with ASTM D2113 (*Standard Practice for Rock Core Drilling and Sampling of Rock for Site Exploration*) using a using a NQ3 size, triple-tube core barrel with a diamond bit.

Soils were classified in the field by a GES field geologist using ASTM Visual-Manual procedures (ASTM D2488, *Standard Practice for Description and Identification of Soils [Visual-Manual Procedure]*). The field geologist also collected samples from the split-spoon sampler and rock core sampler for geotechnical laboratory testing.

The boring logs and standard boring classification guidelines are contained in **Appendix C**.

2.2 Laboratory Testing

GES contracted with Material Testing Services, LLC (MTS) of Minot, North Dakota to provide geotechnical laboratory testing and evaluation services to aid in classifying and evaluating the physical properties of the soil/rock samples. Soil/rock sample selection and laboratory test parameters were determined by CCI.

The laboratory testing included the following:

- Moisture Content (ASTM D4959 - Standard Test Method for Determination of Water Content of Soil by Direct Heating and D4643 - Standard Test Method for Determination of Water Content of Soil and Rock by Microwave Oven Heating).
- Sieve Analysis (ASTM D422 – Test Method for Particle-size Analysis of Soils).
- Atterberg Limits (ASTM D4318 - Standard Test Methods for Liquid Limit, Plastic Limit, and Plasticity Index of Soils).
- Unconfined Compression Testing (ASTM D2166 – Standard Test Method for Unconfined Compressive Strength of Cohesive Soils).

The laboratory data and reports are provided in **Appendix D.**

3 Site Conditions

The proposed HDD pipeline crossing traverses southwest to northeast across Lake Sakakawea approximately 1 mile northeast of the TGCRA. The physiographic regions where the proposed HDD pipeline crossing is located consist of the McKenzie Upland Unit, located south of the Missouri River and the Coteau Slope Unit, located north of the Missouri River. These units are part of the Great Plains and characterized by rolling to hilly plains with both erosional and glacial landforms. The proposed HDD crossing is located within the historic Missouri River floodplain that was flooded with the construction of the Garrison Dam in 1956 to form Lake Sakakawea. This area is located in the central portion of the Williston Basin.

The surface geology in the area consists of thin layers of glacial deposits underlain by the Paleocene-Aged Sentinel Butte Formation and the Bullion Creek Formation. The Sentinel Butte Formation consists of layers of silt, clay, sand, lignite, carbonaceous shale, and mudstone (Carlson, 1985). The Bullion Creek Formation underlies the Sentinel Butte Formation and consists of yellowish layers of silt, clay, and sand with interbedded sandstone, lignite, baked clay, and

limestone (Bluemle, 1977). Both formations are poorly lithified and form rolling topography over broad areas of Western North Dakota. The Sentinel Butte Formation outcrops along the north south shoreline of the Missouri River near WB-4 and both the Sentinel Butte and Bullion Creek Formations outcrop along the north shoreline of the Missouri River near WB-9 (Bluemle, 1977).

Soil borings WB-4 through WB-9 generally consist of silts and poorly graded sands and gravels in the upper portions of the borings, consistent with more recent alluvial deposits originating from the Missouri River. These alluvial deposits extend to approximately 45 feet below the mudline in borings WB-4 and WB-9, and to approximately 220 below the mudline at boring WB-7. Underlying the more recent alluvial deposits are deposits of the Sentinel Butte and Bullion Creek Formations.

4 Limitations

The data generated and conclusions and opinions provided are based on the scope of work performed. All work was conducted in a manner consistent with currently accepted geotechnical engineering practices exercised by members of the profession practicing under similar conditions. No other warranty, expressed or implied, is made.

The samples collected and described in this report are representative of the subsurface conditions at the sampled locations and intervals, and therefore, do not necessarily reflect strata variations that may exist between sampled intervals and locations. If variations from the subsurface conditions described in this study are noted during additional investigations and/or construction, recommendations in this report must be re-evaluated.

GES is not responsible for the independent conclusions, opinions, or recommendations made by others based on the data presented in this report. Nor can GES warrant that this report will satisfy the dictates of or provide a legal defense in connection with an environmental law or regulation.

The results reported and any opinions reached by GES are for the benefit of the CCI & Associates and their client and unless agreed to by GES in writing, are not to be disclosed to or relied upon by any third party. The results and opinions set forth by GES in this report will be valid as of the date of the report.

Appendix B – Aquatic Nuisance Species Inspection

ANS INSPECTION REPORT - For equipment brought into or to be used in North Dakota
NORTH DAKOTA GAME AND FISH DEPARTMENT
FISHERIES DIVISION

Company name: Interstate Drilling **Contact:** Mike Zak	**E-mail address:** mikez@interstatedrilling.com	**Phone number:** (701) 741-9951

Water body: Lake Sakakawea **Location:** Tobacco Gardens
Equipment inspected: 6 barge sections, 1 tugboat, various aquatic equipment

Where equipment was last used

Tugboat and four sections of barge last used on Missouri River near Boonville, Mo (taken out 4/20/20)
One barge section has been sitting since December of 2019 – Rock River, Rock Island, IL (taken out DEC 2019)
One barge section has been sitting since August of 2019 – Missouri River, Nebraska City, NE (take out AUG 2019)

ANS Precautions used prior to equipment entering North Dakota

All barge sections were pressure washed with hot water prior to entering North Dakota. Additionally, barge sections and tugboat were dried for 2 weeks to 8 months.

Actual physical and visual ANS inspection

Barge section 1 – few very dry byssal threads found. No limpets or ZM. Cleared for launch.
Barge section 2 – numerous dried byssal threads and 2 dead zebra mussels found, all very dry. Required additional cleaning and inspection.
Barge section 3 – some byssal threads. No mussels or limpets. Cleared for launch.
Barge section 4 slanted – very few byssal threads. Cleared for launch.
Barge section 5 – no attached organism and very few dry byssal threads. Cleared for launch.
Barge section 6 – no attached organic material. Cleared for launch.
Tugboat – no byssal threads or mussels found on the outside of the boat. Required additional cleaning because it was not washed before entering North Dakota. Inside of tugboat does not take on water. No standing water or organics found inside, so did not require additional cleaning or disinfection inside.

Additional comments or notes:

One section of barge and the tugboat were power washed under supervision and were re-inspected. These were cleared to be put into Sakakawea.
Zebra mussels observed had desiccated organs, indicating that they were not alive. It is likely that the pressure washing in Missouri utilized hot water or the two week plus drying period allowed the mussels to die.
Crane did not get put in water – no inspection required.

Status:	**NDGF representative:**	**Date:**
Approved	Ben Holen, ANS Coordinator	5/5/2020

Barge section 2 and zebra mussel that was discovered on it.

Left: Pressure washing the tugboat. Right: Inside of tugboat. No standing water was present.

Line of barges.

LABORATORY TEST RESULTS

Testing Scope

Laboratory testing was proposed to characterize soils index properties including Atterberg limits (liquid and plastic limits) and moisture content. Strength testing included unconfined compression testing.

Index Properties

Testing and classification of soils was performed in accordance with the Unified Soil Classification System as described in ASTM D 2487. Atterberg limits were performed according to ASTM D 4318. Moisture content was determined in accordance with ASTM D 4959 and D 4643. The dry density was determined with direct measurement procedures. Mechanical sieve analysis was done in accordance with ASTM D 422.

Strength Testing

The strength tests consisted of unconfined compression (QU) testing. The QU tests were conducted in accordance with ASTM D 2166.

UNIFIED SOIL CLASSIFICATION SYSTEM

UNIFIED SOIL CLASSIFICATION AND SYMBOL CHART

COARSE-GRAINED SOILS (more than 50% of material is larger than No. 200 sieve size.)			
GRAVELS More than 50% of coarse fraction larger than No. 4 sieve size	Clean Gravels (Less than 5% fines)	GW	Well-graded gravels, gravel-sand mixtures, little or no fines
		GP	Poorly-graded gravels, gravel-sand mixtures, little or no fines
	Gravels with fines (More than 12% fines)	GM	Silty gravels, gravel-sand-silt mixtures
		GC	Clayey gravels, gravel-sand-clay mixtures
SANDS 50% or more of coarse fraction smaller than No. 4 sieve size	Clean Sands (Less than 5% fines)	SW	Well-graded sands, gravelly sands, little or no fines
		SP	Poorly graded sands, gravelly sands, little or no fines
	Sands with fines (More than 12% fines)	SM	Silty sands, sand-silt mixtures
		SC	Clayey sands, sand-clay mixtures
FINE-GRAINED SOILS (50% or more of material is smaller than No. 200 sieve size.)			
SILTS AND CLAYS Liquid limit less than 50%		ML	Inorganic silts and very fine sands, rock flour, silty of clayey fine sands or clayey silts with slight plasticity
		CL	Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, silty clays, lean clays
		OL	Organic silts and organic silty clays of low plasticity
SILTS AND CLAYS Liquid limit 50% or greater		MH	Inorganic silts, micaceous or diatomaceous fine sandy or silty soils, elastic silts
		CH	Inorganic clays of high plasticity, fat clays
		OH	Organic clays of medium to high plasticity, organic silts
HIGHLY ORGANIC SOILS		PT	Peat and other highly organic soils

LABORATORY CLASSIFICATION CRITERIA

GW	$C_u = \frac{D_{60}}{D_{10}}$ greater than 4; $C_c = \frac{D_{30}}{D_{10} \times D_{60}}$ between 1 and 3	
GP	Not meeting all gradation requirements for GW	
GM	Atterberg limits below "A" line or P.I. less than 4	Above "A" line with P.I. between 4 and 7 are borderline cases requiring use of dual symbols
GC	Atterberg limits above "A" line with P.I. greater than 7	
SW	$C_u = \frac{D_{60}}{D_{10}}$ greater than 4; $C_c = \frac{D_{30}}{D_{10} \times D_{60}}$ between 1 and 3	
SP	Not meeting all gradation requirements for GW	
SM	Atterberg limits below "A" line or P.I. less than 4	Limits plotting in shaded zone with P.I. between 4 and 7 are borderline cases requiring use of dual symbols.
SC	Atterberg limits above "A" line with P.I. greater than 7	

Determine percentages of sand and gravel from grain-size curve. Depending on percentage of fines (fraction smaller than No. 200 sieve size), coarse-grained soils are classified as follows:

Less than 5 percent ..... GW, GP, SW, SP
More than 12 percent ..... GM, GC, SM, SC
5 to 12 percent ..... Borderline cases requiring dual symbols

Call To/From Whom	Rick Rogers
Phone number	701-654-7744
Company	USACE
ERM Contact	Pat Robblee
Phone number	612-840-8976
Date	8-17-20
Time of Conversation	2:30 p.m. est
Reference	North Bakken Expansion Project

LOG OF CONVERSATION

I called Mr. Rogers to discuss the schedule for completing site testing at 32WI976. I advised him that ERM is tentatively planning to re-mobilize after Labor Day to complete additional survey and hopefully the testing at 32WI976. I asked Mr. Rogers if his review of the testing plan for the site would be complete prior to Labor Day. Mr. Rogers said he expected review of the testing plan to be complete prior to that date.

CONFIDENTIALITY NOTICE This Call Log contains information which may be confidential, proprietary, privileged, or otherwise protected by law from disclosure or use by a third party. If you have received this facsimile transmission in error, please contact us immediately at the number listed above and take the steps necessary to dispose of this information. Thank you.

Hey Andrea,

If you could get to the login screen, you are doing better than me the last two days! I will figure out what's wrong and get back to you, hopefully before Fri.

As for the schedule, see attached. I'll caveat that on the EA timeline I made some broad assumptions about new timelines, as I haven't gotten anything from FERC about WBI's planned timeline for submission, FERC incorporating, and we'll have another agency review prior to public comment period. But, we can't finalize the 408 permission and get it routed over to RE without the EA being completed by FERC and USACE adopting. So we can definitely discuss on Fri if you think anywhere I am way off base.

-Reece

Subject: [Non-DoD Source] FW: ProjNet Access (UNCLASSIFIED)

Hi Reece -

My ProjNet login appears to no longer be working. Are you able to check with the admin to see if there is something I need to do for access?

Additionally, WBI is asking about the review schedule again and if you are able to upload that file to ProjNet (or share via email) so we have that information and are all on the same page. We have out monthly call scheduled for Thursday where I'd like to see if there are immediate questions from the group on the revised application.

Thanks!
Andrea

Thanks for passing this along Reece. If you are able, it may be worth giving Dawn a call at FERC regarding the EA schedule. I do not know exactly how far out the EA is getting pushed, but I don't believe it is going to be pushed as far out as you are showing it. Once FERC issues the EA (which would be the final EA) the federal 90 day authorization period would start. Any public comments that are received on the EA, FERC would then address in their Order.

Look forward to speaking with the group on Thursday, our call is scheduled for 10:30 central time.

Thanks,
Andrea

Hey Andrea,

If you could get to the login screen, you are doing better than me the last two days! I will figure out what's wrong and get back to you, hopefully before Fri.

As for the schedule, see attached. I'll caveat that on the EA timeline I made some broad assumptions about new timelines, as I haven't gotten anything from FERC about WBI's planned timeline for submission, FERC incorporating, and we'll have another agency review prior to public comment period. But, we can't finalize the 408 permission and get it routed over to RE without the EA being completed by FERC and USACE adopting. So we can definitely discuss on Fri if you think anywhere I am way off base.

-Reece

Hi Reece -

My ProjNet login appears to no longer be working. Are you able to check with the admin to see if there is something I need to do for access?

Additionally, WBI is asking about the review schedule again and if you are able to upload that file to ProjNet (or share via email) so we have that information and are all on the same page. We have out monthly call scheduled for Thursday where I'd like to see if there are immediate questions from the group on the revised application.

Thanks!
Andrea

NORTH BAKKEN EXPANSION PROJECT
CONFERENCE CALL NOTES

MEETING TOPIC:
Status update on Filing of Final Section 408 Application Materials, and General Coordination

DATE OF MEETING:
August 20, 2020 at 10:30 a.m. CST (8:30 a.m. PST) – Project Conference Call

ATTENDEES:

WBI Energy Transmission, Inc. (WBI)
Jill Linn
Kyle Stefka
Greg Huncovsky
Alex Palmer
General Robert Crear (The CREAR Group, LLC)

Environmental Resources Management (ERM)
Andrea Thornton
Wade Hammer

U.S. Army Corps of Engineers (USACE)
Reece Nelson
Jeremy Thury
Jason Renschler
Kody Green
Shenille Lillejord

MEETING NOTES:

- Reece Nelson took role call and started can call commenting that the updated draft Section 408 permit application for the North Bakken Expansion Project (Project) had been received and he had just recently been able to get into the U.S. Army Corps of Engineers (USACE) network sharing site called ProjNet. Later in the call Reece acknowledged that he would start the USACE staff review in the next couple of days which would allow the internal team 30 days to review, comment, and request additional needs, targeting a completion around September 18, 2020. Andrea Thornton noted she had been having problems gaining access to the ProjNet site, and Reece noted he would look into the issue and coordinate with Andrea to gain access.
- Reece noted that he had on-going conversations with the Federal Energy Regulatory Commission (FERC) project manager, but that the FERC team had not provided an update to the FERC schedule for the Project.
- Reece then addressed the USACE project review schedule that he had recently shared with WBI. Reece noted that there were a number of assumptions he made to develop the schedule and that based on all of the assumptions the schedule for complete Section 408 review and real estate authorization from the USACE would likely be mid to late July 2021, based on his schedule. Andrea then requested clarification regarding the initiation of the federal 90 day review that would start once the Environmental Assessment (EA) was authorized.

Andrea noted that in the USACE schedule this would not start until April 2021. Andrea stated that while FERC had not provided an update to the EA schedule, she understood that FERC would be changing the schedule, but this would not go out as far as April 2021. Reece noted that he would connect with the FERC project manager and discuss the schedule.

- Andrea requested clarification that the USACE team would be reviewing the Section 408 materials in an on-going manner, and that there would be no delay in receiving initial comments or feedback due to the FERC schedule. Reece acknowledged, as noted in the first bullet point in these notes, that the USACE would initiate their review in the next couple of days.
- Reece noted that the Section 408 authorization would typically come very quickly after the FERC EA finalization. Reece noted that finalization of the 408 would then be routed internally at the USACE. This would trigger the start of the real estate review process, which was noted in the USACE draft schedule as taking up to 90 days. Andrea asked if this timeline was typical. Shenille Lillejord, the USACE real estate specialist on the call, noted that this timeline is typical, although it is possible it could go more quickly.
- Andrea asked for clarification regarding if construction could start once the Section 408 authorization was final, while the real estate review process is on-going. Reece noted that he would look back at a recent project to determine the steps that were taken and he would get back to Andrea. Both Reece and Shenille noted they did not think it would be likely that construction could be started without the real estate approval.
- Reece summarized that the 408 authorization cannot occur until after the National Environmental Policy Act (NEPA) review was completed, and further the real estate review could not start until the Section 408, Section 10, and Section 404 permits are issued.
- The meeting was adjourned at approximately 11 a.m. Central.

NORTH BAKKEN EXPANSION PROJECT
CONFERENCE CALL NOTES

MEETING TOPIC:
Section 404 Permitting Approach – Project Updates and U.S. Army Corps of Engineers Updates Regarding Nationwide Permit 12

DATE OF MEETING:
August 24, 2020 at noon CST (10:00 a.m. PST) – Project Conference Call

ATTENDEES:

WBI Energy Transmission, Inc. (WBI)
Jill Linn
Greg Huncovsky
Dave Linn

Environmental Resources Management (ERM)
Andrea Thornton
Wade Hammer

U.S. Army Corps of Engineers (USACE)
Jason Renschler

MEETING NOTES:

- Andrea Thornton opened the call by informing Jason Renschler that WBI Energy Transmission, Inc. (WBI) had determined that the best path forward for the Section 404 permitting, based on careful consideration, would be to continue with the Nationwide Permit 12 (NWP 12). Andrea asked if Jason had any thoughts regarding this strategy.
- Jason noted that the new Nationwide Permits that had recently been posted as draft by the U.S. Army Corps would likely be ready by the first part of 2021. Jason further noted that after further evaluating the potential for using an Individual Permit for the Project, he thought that would be a more difficult approach as it would require the USACE to utilize discretional authority, which would need to be run all the way up to the Division commander for approval. Therefore, Jason noted that NWP 12 would be the best approach. The group agreed that this would be the path forward.
- Wade Hammer asked Jason if there would be subsequent review after the Nationwide Permits are re-authorized to complete the review for regional conditions, and for the state of North Dakota to review the revised permits for compliance with Section 401 Water Quality Certification, which is delegated to the state. Jason stated that the USACE and the state of North Dakota would be completing parallel review with the Nationwide Permits, and so additional timing should not be expected.
- The call ended at approximately 12:15 p.m. Central.

LOG OF CONVERSATION

Rick Rogers from the USACE called me to discuss the archaeological testing of site 32WI976. We discussed methodology and finalized our approach. We also determined the date that we would be starting. We confirmed who would be on the archaeological crew and that at least one individual is listed on the ARPA permit. Rick asked that I make a small update to the work plan and resubmit it to him.

Update 4:25 pm.

I called Rick Rodgers back to confirm he understand one aspect of our planned methodology with regard to unit excavation so that we are on there wasn't any confusion.

Jeremy, Yes we should be able to make a date in early October work. I will visit with Andrea/Jill about us getting together the right folks to address all the questions on the pre-assessment document and get back to you next week with some dates/times for the meeting. Assuming that we need to visit both sides, it will take a good share of a day with the travel and we may need to notify the adjacent private landowners regarding access for the site visit.

_____

Good Morning,

Part of the outgrant process for the Corps of Engineers is to assess, determine and document the environmental conditions of property (ECP) in and ECP Report. This report summarized the historical, cultural, and environmental conditions of the property subject to the real estate transaction. Completion of this report requires a site visit and completion of the attached "Previsit questionnaire"(PVQ) to gather information to better understand the environmental concerns for the site. The PVQ should be completed for the property proposed for easement only (not the company as a whole). The Corp would also like to request a representative of WBI to be present for the site visit to answer questions and provide access to the work site.

Please complete the attached questionnaire and let me know any availability WBI may have for a site visit in early October.

Thank you and please do not hesitate to contact me with any questions.

Good Evening Rick,

Hope you're doing well. Please find attached the updated work plan with the changes we discussed over the phone on Tuesday.

Please don't hesitate to reach out to me with questions.

Best,
Kevin

LOG OF CONVERSATION

I called Rick Rogers, Archaeologist with the USACE, to check-in regarding progress for the archaeological testing taking place at site 32WI976. He did not answer, so I left a message.

Update 1:42 pm.

Rick returned my call and I provided him with an update of our ongoing work on site 32WI976.

Richard R. Rogers, Archaeologist
U.S Army Corps of Engineers
201 1st Street, RM210
Riverdale, ND 58565

Subject: WBI Energy Transmission, Inc.
North Bakken Expansion Project – Class III Survey Reports 2020 Field Season
McKenzie, Williams, Burke, and Mountrail Counties, North Dakota
ND SHPO Ref.: 19-5593

Dear Mr. Rogers:

Please reference WBI Energy Transmission, Inc.'s (WBI Energy's) previous correspondence regarding the above referenced project. WBI Energy proposes to construct and operate the North Bakken Expansion Project (Project) in McKenzie, Williams, Burke, and Mountrail Counties, North Dakota.

The Project is regulated by the Federal Energy Regulatory Commission (FERC) under Section 7(c) of the Natural Gas Act. Under the Energy Policy Act of 2005, FERC is the lead agency for coordinating federal authorizations and complying with the National Environmental Policy Act on natural gas pipeline projects subject to its jurisdiction. FERC similarly is the lead federal agency for complying with Section 106 of the National Historic Preservation Act (NHPA) on natural gas pipeline projects under its jurisdiction. In accordance with 36 CFR 800.2(c)(4), WBI Energy is assisting the FERC in meeting its obligations under Section 106 of the NHPA by coordinating with agencies and tribes and conducting surveys to identify historic properties that may be affected by the Project.

Enclosed for your review please find Class III survey reports for the archaeological and historic structures surveys that were conducted during the 2019 and 2020 field seasons. The archaeological report includes the results provided in the original Class III report and addresses comments that were provided by the State Historical Society of North Dakota, Bureau of Land Management, U.S. Army Corps of Engineers, and the U.S. Forest Service. The attached table summarizes our response to those comments and provides the location of the relevant revisions or clarifications. A report on geomorphological investigations is also included in this submittal.

WBI Energy would appreciate your comments on the attached reports. If you have any questions or comments on the Project or the reports, please contact me at 612-840-8976 or pat.robblee@erm.com, or Dr. Kevin Malloy at 906-285-0361 or kevin.malloy@erm.com. Please direct written correspondence to Dr. Malloy's attention at:

Attachment: Table summarizing agency comments on the original Class III archaeology report

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Comments from the State Historical Society of North Dakota		
General comments:		
o Provide more background information on sites with previous work. Focus on methods and reasoning for previous eligibility recommendation.	Additional information on previous investigations has been added to site descriptions, as applicable.	Sections 5.3 through 5.7
o Map symbology has item named “Shovel test – No Dig”. Are these shovel probes that were planned, but not excavated for some reason? If so provide explanation.	These are planned but unexcavated shovel tests. Site descriptions have been updated, as applicable, to explain why some planned shovel tests were not excavated. Typical reasons for not excavating shovel tests include the presence of buried utilities (documented through One-Call markings) or slope.	Sections 5.3 through 5.5
Avoidance, 50 ft buffer minimum, fence, and monitor:		
o Private land: 32BK277, 32BK279, 32BK280, 32BK282, 32MZ3308, 32MZ3309, 32MZ3310, 32MZ3311, 32MZ3325, 32MZ3327, 32WI1494, 32WI1630, 32WI2144, 32WI2388, 32WI2389, 32WI2391, 32WI2392, 32WI2393, 32WI2394, 32WI2398, 32WI2406, 32WI2408.	Each of these sites is avoided with a minimum 50 ft buffer. Additionally, for sites located between 50 and 100 ft of Project workspace, WBI Energy commits to fencing and monitoring at these locations.	Section 5.3
o US Forest Service Sites: 32MZ3301, 32MZ3314, 32MZ3315, 32MZ3319, 32MZ3320, 32MZ3322, 32MZ3324.	Each of these sites is avoided with a minimum 50 ft buffer. Additionally, for sites located between 50 and 100 ft of Project workspace, WBI Energy commits to fencing and monitoring at these locations.	Section 5.5
Formally evaluate with site delineation and at least one 1x1 m TU. Submit evaluation plan prior to fieldwork:		
o Private Land: 32BK278, 32MZ3302, 32MZ3306, 32MZ3307, 32MZ3318, 32MZ3323, 32MZ3326, 32MZ3328, 32MZ3329, 32MZ3331, 32WI2390, 32WI2405, 32WI2407, 32WI2409, 32WI2410.	Additional testing (shovel testing and/or the excavation of at least one, 1 x 1 m test unit) was completed at each of these sites in accordance with a testing plan approved by the SHSND. Testing at sites 32WI2390 and 32MZ3328 was suspended following the identification of stone features at these sites; however, the pipeline route has been adjusted to avoid these sites with a minimum 50-ft buffer.	Section 5.3
o US Forest Service Site: 32MZ2346.	While ERM planned to conduct additional testing at this site, the pipeline route was modified prior to this work such that the site is now avoided by the Project with a buffer greater than 100 ft.	Section 5.5
Isolated finds:		
o Discuss subsurface potential on all IFs on a case-by-case basis. If the finds are in a good depositional context, STPs may be necessary to show that these are truly isolates. Minimal site recording may be enough to get a site number for database purposes, but more information is needed to verify that these are truly part of a category that can be written-off as not eligible.	Individual descriptions of isolated finds have been added to the text, including the results of shovel testing or an explanation for why shovel tests were not excavated.	Section 5.7

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Site-by-site comments, private land:		
o 32BK168 – Expand reasoning for Not Eligible Determination both previously and now. Newly recorded site boundary included previously unidentified features. Perhaps site should be unevaluated. Consider formal evaluation and provide updated management recommendations.	ERM conducted site testing at 32BK168 in 2020. Evidence of intact cultural deposits and features was identified during testing and the site is now recommended as eligible for listing in the NRHP. The pipeline route has been modified to avoid this site with a buffer of 57 ft.	Section 5.3
o 32MZ3323 – Discussion mentions "Better Examples" of homesteads. Provide examples.	The description for 32MZ3323 has been updated to incorporate the results of additional testing (shovel testing and the excavation of a 1 x 1 m test unit) in the updated Class III report.	Section 5.3
o 32WI1495 – Actual well shown in Figure 5.3-81 may be visible in figure 5.3-80. Is this location impacted by project? Consider site lead.	The location of the well (which is no longer extant) is discussed in the updated Class III report in conjunction with 32WI1495. ERM has submitted a site lead form for this resource. The suggested boundary of the site lead is 19 ft from Project workspace. The actual location of the well is about 235 ft from Project workspace.	Section 5.3
o 32WI2404 – How is this identified as prehistoric? Could it be a result of natural glacial and/or historic or modern field clearing? Provide evidence. Fence and monitor as necessary.	The interpretation of the feature at 32WI2404 as prehistoric is conservative and based on best professional judgement. Tribal cultural specialists who visited the site with ERM concurred with this interpretation.	Section 5.3
o 32WI2408 – Workspace is extremely close to possible graves. Is the planned route fixed?	The pipeline route has been modified to avoid this site with a buffer of 213 ft.	Section 5.3
Site-by-site comments, US Army Corps of Engineers land:		
o 32MZ976 – Drilling under site is not avoidance as leaks and emergency repairs do consider cultural resources. Formal testing or horizontal avoidance is necessary.	The trajectory of the HDD will be 160 to 180 ft below ground surface where it passes beneath 32WI976. The pipeline will carry gas, not a liquid; the gas would migrate to the surface and dissipate into the air in the event of a leak. Given the depth of the HDD installation, daylighting of the pipeline for repair would not be feasible. If repair is required in the future, the most likely course of action would be to re-install a new segment via HDD, which would require federal authorizations, thereby triggering review of the action under Section 106 of the NHPA. A description of the HDD method has been added to the description of 32WI976 in Section 5.4 of the report. Additional testing at the site is pending and scheduled to be completed this fall. The results will be discussed in an addendum report.	Section 5.4
o 32MZ976 – Show bore location and HDD line on map	A figure showing the HDD alignment with entry and exit points has been added to the description of this site as has a construction alignment sheet. The alignment sheet depicts the HDD in plan and profile.	Section 5.4

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
o 32MZ976 – Clarify and provide more evidence for geomorphological hypothesis of A horizon being related to flood deposits. Typically, A horizons show stability rather than accretional or erosional events. Provide more information on why artifacts are interpreted as disturbed rather than in primary context.	The text in the updated Class III report has been updated to address this comment. As noted above, additional testing is planned to occur at 32WI976 this fall, which will provide additional information on the soils present at the site.	Section 5.4
o 32MZ976 – Did cut bank provide additional information on buried soils? Were artifacts identified in cut bank?	The cut bank was examined during the initial survey. As noted above, additional testing is planned to occur at the site this fall with results to be discussed in an addendum report.	Section 5.4
o 32WI976 – Given size and shape of site, additional TUs recommended.		
Comments from the Bureau of Land Management		
o The recommended protection/avoidance measures for unevaluated and eligible archaeological sites in the Class III report are inadequate, particularly regarding stone feature sites. The usual avoidance distance requested/required by the BLM is 100 feet. More than 100 feet is preferred for stone feature sites. Revise protection/avoidance measures buffers for archaeological sites.	WBI Energy has routed the pipeline to avoid unevaluated and eligible sites with a minimum buffer of 50 ft as directed by the SHSND.	Sections 5.3 through 5.5
o Why were indirect effects to archaeological sites not considered? Setting is an important aspect of integrity for stone feature sites. There are numerous archaeological sites within and near the survey corridor that should be analyzed for indirect effects. Revise the report to address indirect effects to archaeological sites.	The report has been updated to include an assessment of physical and non-physical impacts on unevaluated and eligible sites.	Sections 4 and 5.5 through 5.5
o WBI Energy needs to develop a cultural resource monitoring plan for construction.	WBI Energy commits to preparing a monitoring plan for construction.	Sections 5.3 through 5.5
o Update site form for all sites, site leads, and isolated finds regardless of whether they were relocated. Even if a cultural resource could not be relocated, that is still valuable information for the next project/site visit.	Site form updates have been submitted for all sites, isolated finds, and site leads discussed in the updated Class III report	N/A
o WBI Energy should make additional efforts to involve tribes in upcoming 2020 fieldwork and field reviews.	As discussed in more detail in Section 4 of the updated Class III report, WBI Energy retained Beaver Creek Archaeology to coordinate tribal participation in fieldwork in 2020. BCA worked with tribes to document sites as cultural heritage resources. The results of that work will be presented in a separate report. Information on tribal participation in the surveys also is provided in Sections 4 and 5.3 through 5.5 of ERM's updated Class III report	Sections 4 and 5.3 through 5.5

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Comments from U.S. Army Corps of Engineers		
o In section 5.4.2, remove figures for 32MZ0598 and move to the previous section.	This comment is addressed in the updated Class III report	Section 5.4
o Figure 5.4-5: Map of Site 32WI976, provide contour lines on this map to show the slope. This information would help to explain why the shovel testing pattern appears the way it does.	Contour lines are provided on Figure 5.4-9 in the updated Class III report.	Section 5.4
o ERM, on behalf of WBI [Energy], identified a second concentration of artifacts in the western side of site 32WI0976 after they started excavating the test unit. Some additional testing is needed here as USACE cannot agree with the recommended determination for this site given the data presented in this report.	Additional testing will be completed at this site in the fall of 2020 with the results presented in an addendum report.	Section 5.4
o USACE recommends that WBI [Energy] conduct a remote sensing evaluation (gradiometer or conductivity) at site 32WI0976. This would be the best way to produce measurable data regarding the presence/absence of subsurface features at the site.	A remote sensing survey of the site was completed in the summer of 2020. The results of the survey were used to prepare a testing plan for 32WI976. Additional testing at the site will occur this fall with the results presented in an addendum report.	Section 5.4
Comments from the U.S. Forest Service		
o The map showing previously recorded cultural resources within a one-mile radius is only included in the overall Class III and not in the Forest Service stand-alone report. Please include this in the stand-alone Forest Service report.	This comment is no longer applicable. Survey results for USFS lands are included in the updated Class III inventory report in Section 5.5.	N/A
o Figure 1.1-2 shows the Forest Service surface and differentiates between the survey corridor and the survey corridor on Forest Service surface; however, the survey corridor on Forest Service surface and the actual Forest Service surface displayed don't match.	This comment is no longer applicable. Survey results for USFS lands are included in the updated Class III inventory report in Section 5.5.	N/A
o Sites 32MZ2347 (Historical Archaeological) and 32MZ3278 (Cairn) are located immediately adjacent to the survey corridor but are not discussed. Please discuss.	Based on route modifications, 32MZ3278 was visited in 2020 and the site boundary expanded based on the findings. A discussion of the site is provided in the updated Class III report. 32MZ2347 is outside the inventory corridor for the Project; however, we have included a discussion of this site in the Class III inventory report.	Section 5.5
o Site 32MZ145 site form update does not appear to have been performed. Why? Was an attempt made to actually relocate the site? Also, according to the site form, a THPO representative requested avoidance in 2013. More work on this site is probably needed.	When 32MZ145 was first recorded in 1979, it was characterized as two stone cairns. Subsequent investigations described the site as consisting of a single historic rock clearing pile on the west side of Highway 1806, noting that the second pile was likely destroyed by construction of the highway. ERM's survey in 2019 was limited to the east side of Highway 1806, which explains why we did not relocate the site at that time. In 2020, ERM conducted additional survey on USFS lands, examining a corridor on the west side of Highway 1806. 32MZ145 was relocated as a result of this work. The site is discussed in the updated Class III report. Tribal cultural specialists who accompanied ERM during the 2020 field investigation concurred that 32MZ145 is historic rock clearing pile.	Section 5.5

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
o Site 32MZ2346 and 32MZ144: it is very improbable and therefore suspicious that there are zero artifacts and one artifact respectively at sites with historic dumps.	Sites 32MZ2346 and 32MZ144 are both previously recorded historic sites which ERM revisited and recorded during the survey for the Project. Cultural material was observed at both sites as described in the updated Class III report. ERM expanded the boundaries of 32MZ2346 to encompass two previously unreported features at the site. One artifact–a commemorative coin–was collected from 32MZ2346 because of its uniqueness. No artifacts were collected from 32MZ144. Expanded descriptions of both sites are provided in the updated Class III report.	Section 5.5
o Additional survey is shown as needed near site 32MZ3278 on the maps in the overall Class III report but not in the Forest Service stand-alone report. Please include this in the stand-alone Forest Service report.	Additional survey was completed in 2020 on USFS lands in the vicinity of 32MZ3278, which was relocated. A description of the site is provided in the updated Class III report.	Section 5.5
o The recommended avoidance and fencing measures are inadequate, especially for stone feature sites.	All stone feature sites have been avoided with a minimum buffet of 50 ft. Additionally, for sites between 50 and 100 ft of Project workspace WBI Energy commits to fencing and monitoring the sites during construction. WBI Energy will provide a monitoring plan for agency review.	Section 5.5
o A monitoring plan is needed.	WBI Energy commits to providing a construction monitoring plan as discussed in the updated Class III report.	
o Updates should have been conducted for all sites, site leads, and IFs [isolated finds] regardless of whether or not they were relocated.	Site form updates have been submitted for all applicable sites, isolated finds, and site leads discussed in the report	N/A
o The discussion of site leads during fieldwork is inadequate.	Site leads are discussed in Section 5.6 of the updated Class III report.	Section 5.6
o Provide specific distances between site boundaries and the edge of the workspace.	Distances between sites and Project workspaces have been added to summary tables and site descriptions throughout the updated Class III report.	Sections 5.3 through 5.5
o Provide a map of shovel testing performed outside of site boundaries. The report explains the testing strategy during survey but never discusses or shows specifics except within site boundaries.	The route maps provided as Appendix B depict survey methodology in addition to survey coverage and results.	Appendix B
o Identify the level of tribal involvement in the survey.	Tribal participation in field surveys is discussed in Sections 4 and 5.3 through 5.5 of the updated Class III report.	Sections 4 and 5.3 through 5.5
o Discuss whether indirect effects to archaeological sites were considered.	For unevaluated sites, we have added an assessment of non-physical impacts on setting.	Sections 5.3 through 5.5

Hey Andrea,

I noticed that too, and sent a reminder to the team yesterday. I have a date of COB Sep 21 that comments are due.

Need to get an updated schedule to you as well, it's on my list to work this week/weekend.

-Reece

Subject: [Non-DoD Source] ProjNet Review - North Bakken Expansion

Hi Reece and Jeremy -

I took a look at ProjNet this morning and noticed that there is only 1 outstanding comment which was a straggler from the first review back in April/May. On our call on August 20th it was discussed that the 30 day review period for the updated 408 permit package would be ending on September 18th. I wanted to check in to make sure that this was still the case.

Thanks,

Andrea

Subject: North Bakken Expansion Project Outgrant Pre-Visit Questionaire
Attachments: WBI NBE Outgrant Pre-Visit (PVQ).pdf

Follow Up Flag: Follow up
Flag Status: Flagged

Hi Jeremy I hope all is well with you.

Attached is WBI Energy's North Bakken Expansion Project outgrant pre-visit questionnaire. I have added some additional comments below for further clarification.

Natural Resource Management section, question #3:

- *While the project crosses the Missouri River floodplain, the proposed pipeline will be installed under the Missouri River floodplain using the HDD method. The entry side (northern drill location) will be about 800 feet from the shoreline at an elevation of about 1,850 feet. The exit site (southern drill location) will be approximately 2,150 feet from the shoreline at an elevation of about 1,925 feet. No aboveground structures will be installed within the floodplain. Project construction and operation will not affect floodplain elevations, river flows, or flood storage capacities. Additionally, project construction and operation will not affect the occupancy of the floodplain, nor will it result in modifications to the floodplain or promote floodplain development.*

Natural Resource Management section, question #5:

- *There is known piping plover and least tern habitat within the drill path. There are two reported piping plover nest sites (one from 2005 one from 2007) within the easement area along the north side of the lake. The operation of the Project would not impact available nesting habitat.*

- *One small area of Dakota skipper reproductive habitat was found on USACE land on the southern side of the lake and will be crossed by the HDD drill path with no surface impacts. The operation of the Project would not impact available Dakota skipper habitat.*

- *Pallid sturgeon may be present during portions of the year within the HDD path and easement. The operation of the Project would not impact available pallid sturgeon habitat.*

Please let me know a date/time that works for you to meet Dave Linn and myself at the project location.

Thanks Jeremy

Outgrant Pre-visit Questionnaire (PVQ)

Name of Outgrant: WBI Energy Transmission, Inc.

Outgrant POC: Greg Huncovsky

Outgrant Telephone Number: 406-359-7451

Outgrant Email: greg.huncovsky@wbienergy.com

This questionnaire will provide background information necessary to plan and conduct an environmental compliance assessment. Additionally it provides insight for properly designing the composition of expertise on the assessment team.

Corps POC: Jeremy Thury

Corps Email: jeremy.j.thury@usace.army.mil Corps Tel #: 701-654-7761

General

1. Do you have any permits/licenses/letters or approval from the State, County, or municipality for your operations/activities? No

   If Yes, what types of permits/licenses/letters of approval?

   All permit approvals will be received prior to construction of the North Bakken Expansion Project including but not limited to: FERC, USACE, USFS, BLM, USFWS, SHPO, NDDEQ, and State Water Commission.

Air Emissions Management

1. Do you operate a fuel burner/steam generator/boiler? No

   If Yes, indicate the size and the type of fuel used:

2. Do you operate an incinerator (i.e. for classified documents, solid waste, etc) No

3. Do you operate fuel dispensing facilities for vehicles, watercraft, or heavy equipment (i.e., diesel, gasoline, biofuels, kerosene, etc) No

4. Do you strip paint from watercraft or other equipment for the purposes of re-painting? No

5. Do you repair any equipment containing refrigerant (e.g., motor vehicles, air conditioners, freezers, refrigerators, chillers)? No

Cultural Resources Management

1. Do you occupy any facility or site currently listed in the Federal or State list of historic places? No

2. Do you have any archeological artifacts in storage or on display? No

3. Do you know of any Native American burial sites, cemeteries, or possible locations of human remains on your site? No

Hazardous Materials Management

1. Have you conducted training for individuals working with hazardous materials such as paints, solvents, fuels (i.e., HAZCOM)? No

2. Do you have a written Hazard Communication (HAZCOM) Plan? No

3. Do you store any of the following extremely hazardous substances? No

Aldrin	No
Ammonia	No
Chlorine	No
Chloroform	No
Dinitrotoluene	No
Formaldehyde	No
Hydrocyanic Acid	No
Lindane	No
Nitric Acid	No
Potassium Cyanide	No
Sodium Cyanide	No

4. Do you store at any one time 10,000 lb or more of any hazardous substance which requires a Safety Data Sheet (SDS)? (NOTE: Fuel is a hazardous substance which requires an SDS) No

   Please list the materials. (NOTE: Using water as a basis of measurement, 10,000 lb is approx. 1250 gal.)

5. Do you store any compressed gases (i.e. acetylene cylinders, oxygen cylinders, propane)? No

Hazardous Waste Management

1. Do you generate hazardous waste (i.e., waste paint, paint stripper, battery acid, etc)? No
2. Do you typically generate less than 100 kg (229.46 lb; approx 28 gal) of hazardous waste in 1 month? No
3. Do you typically generate more than 100 kg (229.46 lb; approx 28 gal) of hazardous waste a month? No
4. Which of the following items do you handle as Universal Waste?

Fluorescent bulbs	☐
Alkaline Batteries	☐
Nickel-Cadmium Batteries	☐
Lithium Batteries	☐
Magnesium Batteries	☐
Lead-acid Batteries	☐
Mercury-containing equipment	☐
Waste Pesticides	☐

Natural Resources Management

1. List the recreational opportunities offered (i.e., athletic fields, walking/hiking tracks, off-road vehicle tracks, etc).

2. Do you have wetlands in your leased areas? No
3. Do you have floodplains in your leased areas? Yes

   If Yes, indicate the type:

25-yr	☐
50 – yr	☐
100-yr	☑

4. Do you conduct any dredging? No
5. Are you aware of any known threatened or endangered species on your leased areas? Yes

Outgrant Pre-visit Questionnaire (PVQ)

Pesticides Management

1. Do you use pesticides on your leased area? No

   If Yes, how are the pesticides applied?

   By a contractor ☐

   Self-application ☐

Petroleum, Oils, and Lubricants (POL) Management

1. If applicable, do you have a federally-required Spill Prevention Control and Countermeasure Plan? No
2. Do you have pipelines? No
3. Do you generate used oil/waste oil? No

Solid Waste Management

1. Who picks up your trash/garbage? Not Applicable
2. Do you have a recycling program? No

   If yes, which of the following do you recycle?

   Glass ☐

   Plastic Bottles ☐

   Beverage Cans ☐

   Paper ☐

   Cardboard ☐

   Printer cartridges ☐

3. Do you have a landfill or dumping area on your leased property? No

Storage Tank Management

1. Do you have aboveground storage tanks (ASTs) used for the storage of petroleum products, used oil, hazardous waste, or other potential contaminant? No

   If Yes, list the tanks individually

Tank Capacity	Contents

2. Do you have underground storage tanks (USTs) used for the storage of petroleum products, used oil, hazardous waste, or other potential contaminants? No

   If Yes, list the tanks individually

Tank Capacity	Contents

Toxic Substances Management

1. Do you have any of the following types of equipment contaminated with PCBs on your leased site? No

   If Yes, indicate which are known to be present:

Transformers	☐
Capacitors	☐
Ballasts	☐
Electromagnets	☐
Circuit Breakers	☐
Heat Transfer or Hydraulic Systems	☐
Other	

2. Do you have known asbestos on your leased site? No

3. Do you have any known facilities on your leased area with elevated radon levels? No

Wastewater Management

1. Does your wastewater go to a publically owned treatment works (POTW) (i.e., a municipal/county/Corps system not on the leased property? No

2. Does your wastewater go to any of the following? No

Sewage Lagoon	☐
Septic System	☐
Leach Field	☐
Package Plant	☐
Sedimentation Holding Ponds	☐

Water Quality Management

1. Do you provide drinking water to the public or employees (i.e., a water fountain, a faucet; NOT bottled water)? No

2. Do you maintain a drinking water well? No

3. Do you operate an underground injection control (UIC) well? No

   (NOTE: The most common type of UIC is a Class V motor vehicle waste disposal well that receives or has received fluids from vehicular repair or maintenance activities, such as an auto body repair shop, automotive repair shop, specialty repair shop (e.g., transmission and muffler repair shop), or any facility that does any vehicular repair work.)

4. Do you own/operate a public swimming area (i.e., a beach, a pool) No

Re: WBI Energy Transmission, Inc.
North Bakken Expansion Project
Nationwide Permit 12 – Pre-Construction Notification

Mr. Renschler,

WBI Energy Transmission, Inc. (WBI Energy) proposes to install approximately 94 miles of pipeline, including new pipeline, pipeline looping and upgrades to existing pipelines, as well as construction and upgrades to compressor stations and other appurtenances to transport natural gas from WBI Energy's existing Tioga Compressor Station near Tioga, Williams County, North Dakota, to a new interconnect with Northern Border's mainline southeast of Watford City, McKenzie County, North Dakota. The North Bakken Expansion Project (Project) would require crossing wetlands and waterbodies that would require Clean Water Act, Section 404, permits for dredge and fill, as well as a Section 10 of the Rivers and Harbors Act permit for a proposed crossing of Lake Sakakawea.

WBI Energy submitted a draft pre-construction notification (PCN) in February 2020, to coincide with the filing of the Project's Federal Energy Regulatory Commission application. WBI Energy is submitting a revised PCN that includes updated survey results due to additional land access and some minor route adjustments. The PCN includes the same project details and supporting materials that were submitted in February 2020, along with the updated project survey results, to provide the necessary information to facilitate U.S. Army Corps of Engineers (USACE) review in accordance with Nationwide Permit 12 (NWP 12) – Utility Lines. The PCN is required according to both NWP 12 and regional conditions that require a PCN for crossing of Lake Sakakawea (Section 10, navigable waterbody). According to NWP requirements, WBI Energy has included information for all Project crossings of water resources. WBI Energy requests use of the preliminary jurisdictional determination process for review of the Project. Given the Project crosses numerous landowners, access to the Project site would need to be coordinated with WBI Energy.

As noted in the enclosed PCN materials, the Project is under review by the Federal Energy Regulatory Commission (FERC) under section 7(c) of the Natural Gas Act. In coordination with the overall National Environmental Policy Act review that FERC is completing, WBI Energy is working closely with the U.S. Fish and Wildlife Service as they consult with FERC, as the lead federal agency for the Project, to complete consultation under Section 7 of the Endangered Species Act. Similarly, WBI Energy is coordinating with the North Dakota State Historic Preservation Office to facilitate review and consultation with FERC under Section 106 of the National Historic

Preservation Act. WBI Energy has also met and is coordinating with staff from the USACE – Omaha District office to coordinate Section 408 review of the Lake Sakakawea and adjacent USACE-owned land crossings proposed for the Project. WBI Energy anticipates keeping you appraised of developments related to these parallel review efforts to help facilitate your completion of review under NWP 12.

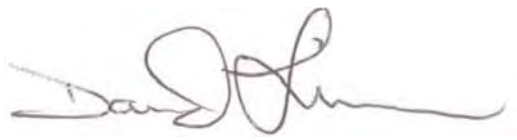
The materials included in the enclosed PCN conform to the general NWP requirements, as well as all regional conditions. The following attachments are included in this submittal:

ATTACHMENTS:

- U.S. Army Corps of Engineers Form ENG4345
- Supporting Information document, including appendices, as follows:
    - Appendix A – Aerial Route Maps
    - Appendix B – SPCC Plan
    - Appendix C – HDD Plan
    - Appendix D – Construction Typical Drawings
    - Appendix E – Wetland and Waterbody Delineation Report
    - Appendix F – Site-Specific Design Drawing for Lake Sakakawea HDD

WBI Energy appreciates your assistance and review of the enclosed materials and should you have questions or require additional information during your review, please contact Dave Linn (406) 359-7333.

Respectfully submitted,



Dave Linn
Senior Engineering and Projects Manager

LOG OF CONVERSATION

Ms. Thornton called Mr. Bickerdyke to discuss the potential need for additional paleotological sueveys on U.S. Forest Service Land. Surveys were completed in 2019, however since that time the alignment on U.S. Forest Service lands has changed. Based on SWCA's (ERM's contractor) review of the current survey corridor, they did not believe that additional surveys would be warrented. Surveys in 2019 found a very limited number of exposures. Mr. Bickerdyke agreed that additional surveys are not needed and indicated that histrocially paleontological resources have not been found in this area of the grasslands. Ms. Thornton indicated that SWCA will update their report to note this conversation and thanked Mr. Bickerdyke for his time.

MEETING TOPIC:

North Bakken Expansion Project Introduction, Route Review USFS Land

DATE OF MEETING:

July 23, 2020 at 1:00 p.m. PST – TEAMS Meeting

ATTENDEES:

WBI Energy Transmission, Inc. (WBI)
Dave Linn
Greg Huncovsky
Kyle Stefka
Bob Stanhope
Jill Linn

Environmental Resources Management (ERM)
Andrea Thornton

U.S. Forest Service (USFS)
Kim Grotte
Cale Bickerdyke

MEETING NOTES:

Ms. Thornton started the meeting by thanking everyone for taking the time to meet again today to run through the route on USFS land. Mr. Stanhope from WBI Energy then shared his screen with the group and ran through the proposed alignment and constraints that have been identified in the field. The group discussed options including continuing to move east from the current alignment and moving west across Highway 1806. ERM and WBI Energy noted that they will send cultural and civil crews to the area west of Highway 1806 to see if that route would be feasible. Ms. Thornton indicated she would continue to keep Mr. Bickerdyke and Mr. Grotte updated as to what is found in the field.

Subject: Crews on the USFS land

Hi Liv,

I wanted to touch base with you about our crew's activities. Given the density of sites that we've identified, the civil surveyors are out on the USFS lands today looking for potential route options on the east side of HWY 1806. We were asked yesterday afternoon to send our archaeology crew out with them to help in process of identifying viable route that wouldn't disturb any archaeological sites. The plan is for them to only conduct pedestrian survey today and record any surface sites as they go. When a route is settled upon, the crews will return to conduct any necessary shovel testing, which will ensure that one-calls are in order.

Please let me know if you have any questions.

All the best,
Kevin

Hi Cale –

I was hoping you might have a few minutes tomorrow or Thursday for a call to show you where WBI has landed with a route on FS land. Cultural crews continued to find some sites on the west side of the highway, but they were able to route around them. This route adjustment will be including in our upcoming supplemental filing to FERC.

Hi Liv,

I hope this email finds you well. We have a crew that is going to be out in ND to do some additional fieldwork at the end of this week, none of which is located FS land. However, we received a request this morning to bring some Tribal members out to visit some of the sites identified on the FS land this year on Friday. No shovel testing or survey will be conducted. Our crew will simply bring the Tribal members to the site locations for them to see. This should still fall under our current permit.

Please let me know if you have any questions.
Kind regards,
Kevin

Subject: WBI Energy North Bakken Expansion Project - Revised Biological Evaluation Submittal
Attachments: WBI_USFS-BE_Submittal Letter_091120.pdf

Hi Cale and Kim –

Attached is our transmittal letter for submitting the revised Biological Evaluation for the North Bakken Expansion Project. Due to the size of the file we have created a One Drive folder for you to access the document. Please note that the link to this page will only work for one week so please pull the document onto your computer and server for storage. Please also note that the document is being submitted as CUI/PRIV and should not be shared with the public. I've also included the excel files of the DPG Plant Survey Field Form and shapefiles of the surveyed area which you request with our previous submittal.

https://theermgroup-my.sharepoint.com/:f:/g/personal/andrea_thornton_erm_com/Eqv0yh0MtgtBlXzmf0Pf9CwBc4k0r9f_my--CoytGc5niQ?e=TuEaaj

Please let me know if you have any questions or issues accessing the files.

Thank you,
Andrea

Re: WBI Energy Transmission, Inc. – North Bakken Expansion Project
Biological Evaluation

Dear Mr. Bickerdyke,

WBI Energy Transmission, Inc. (WBI Energy) is seeking authorization from the Federal Energy Regulatory Commission (FERC) under Title 18 Code of Federal Regulations Sections 157.205 and 157.210 to construct, own, operate, and maintain the North Bakken Expansion Project (Project). The U.S. Forest Service (USFS) Manual Section 2672.41 requires a Biological Evaluation (BE) be conducted for all USFS planned, funded, executed, or permitted programs and activities. Environmental Resources Management (ERM) prepared this BE on behalf of WBI Energy at the request of the USFS to assist with the overall permitting requirements for the Project. The BE was prepared in accordance with legal requirements set forth under the National Forest Management Act, and the Dakota Prairie Grasslands Land and Resource Management Plan.

WBI Energy wishes to consult with your office concerning the impacts of the Project. WBI Energy requests your comments if you agree or disagree with WBI Energy's evaluation of the effects of the proposed action on the following:

- USFS sensitive and watch list animals and plants;
- Raptor species of concern; and
- Management Indicator Species

WBI Energy proposes to install approximately 93.5 miles of pipeline, including new pipeline, pipeline looping and upgrades to existing pipelines, as well as construction and upgrades to compressor stations and other appurtenances to transport natural gas from WBI Energy's existing Tioga Compressor Station near Tioga, Williams County, North Dakota, to a new interconnect with Northern Border's mainline southeast of Watford City, McKenzie County, North Dakota. Pipeline construction is currently planned to begin in May of 2021. The Project would include the crossing of approximately 2.1 miles of USFS-managed lands within the Little Missouri National Grassland.

The purpose of the Project is to provide additional capacity necessary for the transportation of incremental natural gas volumes from the Bakken region of northwest North Dakota to Northern Border's existing mainline for transit on that system. The Project would help to satisfy natural gas

demand in the midcontinent region of the United States, and the proposed transportation capacity of the Project is at least an additional 250 million cubic feet per day.

Within USFS-managed lands construction of the proposed pipeline would require a 50-foot wide construction right-of-way with an additional 25 feet of temporary workspace. Additionally, some temporary extra workspace will be required for certain road crossings, points of inflection along the route, and areas where special construction methods will be implemented (e.g., guided bore method). Approximately 23.1 acres of USFS land would be impacted by the Project, which includes the permanent right-of-way, temporary workspaces, and access roads.

On behalf of WBI Energy, ERM conducted a species determination based on the results of habitat surveys conducted by Western Ecosystems Technology, Inc. (WEST) and ERM. As a result of these surveys and subsequent reports, WBI Energy has reached the following determinations:

North Bakken Expansion Project
Summary of Determination for USFS Species of Concern

Species	Impact [a]	
	None [b]	May [c]
Sensitive Plants		
Alkali sacaton (*Sporobolus airoides*)	X	
Alyssum-leaved phlox (*Phlox alyssifolia*)	X	
Blue lips (*Collinsia parviflora*)	X	
Dakota buckwheat (*Eriogonum visheri*)	X	
Dwarf mentzelia (*Mentzelia pumila*)	X	
Easter daisy (*Townsendia exscapa*)		X
Hooker's Townsendia (*Townsendia hookeri*)		X
Lanceleaf cottonwood (*Populus x acuminata*)		X
Limber pine (*Pinus flexillis*)	X	
Nodding buckwheat (*Eriogonum cernuum*)	X	
Sand lily (*Leucocrinum montanum*)		X
Smooth goosefoot (*Chenopodium subglabrum*)	X	
Torrey's cryptantha (*Cryptantha torreyana*)	X	
Sensitive Animals		
Baird's sparrow (*Ammodramus bairdii*)		X
Bald eagle (*Haliaeetus leucocephalus*)	X	
Bighorn sheep (*Ovis canadensis*)	X	
Black-tailed prairie dog (*Cynomys ludovicianus*)	X	
Burrowing owl (*Athene cunicularia*)	X	
Greater sage-grouse (*Centrocercus urophasianus*)	X	
Loggerhead shrike (*Lanius ludovicianus*)		X
Long-billed curlew (*Numenius americanus*)		X
Ottoe skipper (*Hesperia ottoe*)		X
Red-bellied dace (*Chrosomus eos*)	X	
Regal fritillary (*Speyeria idalia*)		X
Sprague's pipit (*Anthus spragueii*)		X

North Bakken Expansion Project
Summary of Determination for USFS Species of Concern

Species	Impact [a] None [b]	Impact [a] May [c]
Tawny crescent (*Phyciodes batessii*)		X
Management Indicator Species		
Sharp-tailed grouse (*Tympanuchus phasianellus*)		X
Raptors		
Ferruginous hawk (*Buteo regalis*)		X
Golden eagle (*Aquila chrysaetos*)		X
Merlin (*Falco columbarius*)	X	
Prairie falcon (*Falco mexicanus*)		X
Peregrine falcon (*Falco peregrinus*)	X	
Watch List Species		
None observed		

[a] Effects determinations including Will Impact, defined as individuals with a consequence that the action may contribute to a trend towards elevated federal listing or cause a loss of viability to the population or species; or Beneficial Impact, defined as benefiting a species and/or habitat and requiring written concurrence from the FWS were not applicable in the analysis.
[b] No impact
[c] May impact individuals or habitat, but will not likely contribute to a trend towards elevated federal listing or cause a loss of viability to the population or species.

Additionally, no eagles or eagle nests were identified during Project surveys. If an eagle nest is identified near the Project during construction, WBI Energy would implement the measures described in sections 4.3.2 (bald eagle) and 4.5.2 (golden eagle) to avoid and minimize impacts on nesting eagles. The proposed Project is not expected to affect bald or golden eagles.

WBI Energy appreciates your assistance and review of the enclosed materials and should you have questions or require additional information during your review, please contact Jill Linn (406) 359-7332.

Respectfully submitted,

Jill Linn

North Bakken Expansion Project – Class III Survey Reports 2020 Field Season
McKenzie, Williams, Burke, and Mountrail Counties, North Dakota
ND SHPO Ref.: 19-5593

Dear Ms. Fetterman:

Please reference WBI Energy Transmission, Inc.'s (WBI Energy's) previous correspondence regarding the above referenced project. WBI Energy proposes to construct and operate the North Bakken Expansion Project (Project) in McKenzie, Williams, Burke, and Mountrail Counties, North Dakota.

The Project is regulated by the Federal Energy Regulatory Commission (FERC) under Section 7(c) of the Natural Gas Act. Under the Energy Policy Act of 2005, FERC is the lead agency for coordinating federal authorizations and complying with the National Environmental Policy Act on natural gas pipeline projects subject to its jurisdiction. FERC similarly is the lead federal agency for complying with Section 106 of the National Historic Preservation Act (NHPA) on natural gas pipeline projects under its jurisdiction. In accordance with 36 CFR 800.2(c)(4), WBI Energy is assisting the FERC in meeting its obligations under Section 106 of the NHPA by coordinating with agencies and tribes and conducting surveys to identify historic properties that may be affected by the Project. A report on geomorphological investigations is also included in this submittal.

Enclosed for your review please find Class III survey reports for the archaeological and historic structures surveys that were conducted during the 2019 and 2020 field seasons. The archaeological report includes the results provided in the original Class III report and addresses comments that were provided by the State Historical Society of North Dakota, Bureau of Land Management, U.S. Army Corps of Engineers, and the U.S. Forest Service. The attached table summarizes our response to those comments and provides the location of the relevant revisions or clarifications.

WBI Energy would appreciate your comments on the attached reports. If you have any questions or comments on the Project or the reports, please contact me at 612-840-8976 or pat.robblee@erm.com, or Dr. Kevin Malloy at 906-285-0361 or kevin.malloy@erm.com. Please direct written correspondence to Dr. Malloy's attention at:

Attachment: Table summarizing agency comments on the original Class III archaeology report

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Comments from the State Historical Society of North Dakota		
General comments:		
o Provide more background information on sites with previous work. Focus on methods and reasoning for previous eligibility recommendation.	Additional information on previous investigations has been added to site descriptions, as applicable.	Sections 5.3 through 5.7
o Map symbology has item named “Shovel test – No Dig”. Are these shovel probes that were planned, but not excavated for some reason? If so provide explanation.	These are planned but unexcavated shovel tests. Site descriptions have been updated, as applicable, to explain why some planned shovel tests were not excavated. Typical reasons for not excavating shovel tests include the presence of buried utilities (documented through One-Call markings) or slope.	Sections 5.3 through 5.5
Avoidance, 50 ft buffer minimum, fence, and monitor:		
o Private land: 32BK277, 32BK279, 32BK280, 32BK282, 32MZ3308, 32MZ3309, 32MZ3310, 32MZ3311, 32MZ3325, 32MZ3327, 32WI1494, 32WI1630, 32WI2144, 32WI2388, 32WI2389, 32WI2391, 32WI2392, 32WI2393, 32WI2394, 32WI2398, 32WI2406, 32WI2408.	Each of these sites is avoided with a minimum 50 ft buffer. Additionally, for sites located between 50 and 100 ft of Project workspace, WBI Energy commits to fencing and monitoring at these locations.	Section 5.3
o US Forest Service Sites: 32MZ3301, 32MZ3314, 32MZ3315, 32MZ3319, 32MZ3320, 32MZ3322, 32MZ3324.	Each of these sites is avoided with a minimum 50 ft buffer. Additionally, for sites located between 50 and 100 ft of Project workspace, WBI Energy commits to fencing and monitoring at these locations.	Section 5.5
Formally evaluate with site delineation and at least one 1x1 m TU. Submit evaluation plan prior to fieldwork:		
o Private Land: 32BK278, 32MZ3302, 32MZ3306, 32MZ3307, 32MZ3318, 32MZ3323, 32MZ3326, 32MZ3328, 32MZ3329, 32MZ3331, 32WI2390, 32WI2405, 32WI2407, 32WI2409, 32WI2410.	Additional testing (shovel testing and/or the excavation of at least one, 1 x 1 m test unit) was completed at each of these sites in accordance with a testing plan approved by the SHSND. Testing at sites 32WI2390 and 32MZ3328 was suspended following the identification of stone features at these sites; however, the pipeline route has been adjusted to avoid these sites with a minimum 50-ft buffer.	Section 5.3
o US Forest Service Site: 32MZ2346.	While ERM planned to conduct additional testing at this site, the pipeline route was modified prior to this work such that the site is now avoided by the Project with a buffer greater than 100 ft.	Section 5.5
Isolated finds:		
o Discuss subsurface potential on all IFs on a case-by-case basis. If the finds are in a good depositional context, STPs may be necessary to show that these are truly isolates. Minimal site recording may be enough to get a site number for database purposes, but more information is needed to verify that these are truly part of a category that can be written-off as not eligible.	Individual descriptions of isolated finds have been added to the text, including the results of shovel testing or an explanation for why shovel tests were not excavated.	Section 5.7

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Site-by-site comments, private land:		
o 32BK168 – Expand reasoning for Not Eligible Determination both previously and now. Newly recorded site boundary included previously unidentified features. Perhaps site should be unevaluated. Consider formal evaluation and provide updated management recommendations.	ERM conducted site testing at 32BK168 in 2020. Evidence of intact cultural deposits and features was identified during testing and the site is now recommended as eligible for listing in the NRHP. The pipeline route has been modified to avoid this site with a buffer of 57 ft.	Section 5.3
o 32MZ3323 – Discussion mentions "Better Examples" of homesteads. Provide examples.	The description for 32MZ3323 has been updated to incorporate the results of additional testing (shovel testing and the excavation of a 1 x 1 m test unit) in the updated Class III report.	Section 5.3
o 32WI1495 – Actual well shown in Figure 5.3-81 may be visible in figure 5.3-80. Is this location impacted by project? Consider site lead.	The location of the well (which is no longer extant) is discussed in the updated Class III report in conjunction with 32WI1495. ERM has submitted a site lead form for this resource. The suggested boundary of the site lead is 19 ft from Project workspace. The actual location of the well is about 235 ft from Project workspace.	Section 5.3
o 32WI2404 – How is this identified as prehistoric? Could it be a result of natural glacial and/or historic or modern field clearing? Provide evidence. Fence and monitor as necessary.	The interpretation of the feature at 32WI2404 as prehistoric is conservative and based on best professional judgement. Tribal cultural specialists who visited the site with ERM concurred with this interpretation.	Section 5.3
o 32WI2408 – Workspace is extremely close to possible graves. Is the planned route fixed?	The pipeline route has been modified to avoid this site with a buffer of 213 ft.	Section 5.3
Site-by-site comments, US Army Corps of Engineers land:		
o 32MZ976 – Drilling under site is not avoidance as leaks and emergency repairs do consider cultural resources. Formal testing or horizontal avoidance is necessary.	The trajectory of the HDD will be 160 to 180 ft below ground surface where it passes beneath 32WI976. The pipeline will carry gas, not a liquid; the gas would migrate to the surface and dissipate into the air in the event of a leak. Given the depth of the HDD installation, daylighting of the pipeline for repair would not be feasible. If repair is required in the future, the most likely course of action would be to re-install a new segment via HDD, which would require federal authorizations, thereby triggering review of the action under Section 106 of the NHPA. A description of the HDD method has been added to the description of 32WI976 in Section 5.4 of the report. Additional testing at the site is pending and scheduled to be completed this fall. The results will be discussed in an addendum report.	Section 5.4
o 32MZ976 – Show bore location and HDD line on map	A figure showing the HDD alignment with entry and exit points has been added to the description of this site as has a construction alignment sheet. The alignment sheet depicts the HDD in plan and profile.	Section 5.4

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
o 32MZ976 – Clarify and provide more evidence for geomorphological hypothesis of A horizon being related to flood deposits. Typically, A horizons show stability rather than accretional or erosional events. Provide more information on why artifacts are interpreted as disturbed rather than in primary context.	The text in the updated Class III report has been updated to address this comment. As noted above, additional testing is planned to occur at 32WI976 this fall, which will provide additional information on the soils present at the site.	Section 5.4
o 32MZ976 – Did cut bank provide additional information on buried soils? Were artifacts identified in cut bank?	The cut bank was examined during the initial survey. As noted above, additional testing is planned to occur at the site this fall with results to be discussed in an addendum report.	Section 5.4
o 32WI976 – Given size and shape of site, additional TUs recommended.		
Comments from the Bureau of Land Management		
o The recommended protection/avoidance measures for unevaluated and eligible archaeological sites in the Class III report are inadequate, particularly regarding stone feature sites. The usual avoidance distance requested/required by the BLM is 100 feet. More than 100 feet is preferred for stone feature sites. Revise protection/avoidance measures buffers for archaeological sites.	WBI Energy has routed the pipeline to avoid unevaluated and eligible sites with a minimum buffer of 50 ft as directed by the SHSND.	Sections 5.3 through 5.5
o Why were indirect effects to archaeological sites not considered? Setting is an important aspect of integrity for stone feature sites. There are numerous archaeological sites within and near the survey corridor that should be analyzed for indirect effects. Revise the report to address indirect effects to archaeological sites.	The report has been updated to include an assessment of physical and non-physical impacts on unevaluated and eligible sites.	Sections 4 and 5.5 through 5.5
o WBI Energy needs to develop a cultural resource monitoring plan for construction.	WBI Energy commits to preparing a monitoring plan for construction.	Sections 5.3 through 5.5
o Update site form for all sites, site leads, and isolated finds regardless of whether they were relocated. Even if a cultural resource could not be relocated, that is still valuable information for the next project/site visit.	Site form updates have been submitted for all sites, isolated finds, and site leads discussed in the updated Class III report	N/A
o WBI Energy should make additional efforts to involve tribes in upcoming 2020 fieldwork and field reviews.	As discussed in more detail in Section 4 of the updated Class III report, WBI Energy retained Beaver Creek Archaeology to coordinate tribal participation in fieldwork in 2020. BCA worked with tribes to document sites as cultural heritage resources. The results of that work will be presented in a separate report. Information on tribal participation in the surveys also is provided in Sections 4 and 5.3 through 5.5 of ERM's updated Class III report	Sections 4 and 5.3 through 5.5

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Comments from U.S. Army Corps of Engineers		
o In section 5.4.2, remove figures for 32MZ0598 and move to the previous section.	This comment is addressed in the updated Class III report	Section 5.4
o Figure 5.4-5: Map of Site 32WI976, provide contour lines on this map to show the slope. This information would help to explain why the shovel testing pattern appears the way it does.	Contour lines are provided on Figure 5.4-9 in the updated Class III report.	Section 5.4
o ERM, on behalf of WBI [Energy], identified a second concentration of artifacts in the western side of site 32WI0976 after they started excavating the test unit. Some additional testing is needed here as USACE cannot agree with the recommended determination for this site given the data presented in this report.	Additional testing will be completed at this site in the fall of 2020 with the results presented in an addendum report.	Section 5.4
o USACE recommends that WBI [Energy] conduct a remote sensing evaluation (gradiometer or conductivity) at site 32WI0976. This would be the best way to produce measurable data regarding the presence/absence of subsurface features at the site.	A remote sensing survey of the site was completed in the summer of 2020. The results of the survey were used to prepare a testing plan for 32WI976. Additional testing at the site will occur this fall with the results presented in an addendum report.	Section 5.4
Comments from the U.S. Forest Service		
o The map showing previously recorded cultural resources within a one-mile radius is only included in the overall Class III and not in the Forest Service stand-alone report. Please include this in the stand-alone Forest Service report.	This comment is no longer applicable. Survey results for USFS lands are included in the updated Class III inventory report in Section 5.5.	N/A
o Figure 1.1-2 shows the Forest Service surface and differentiates between the survey corridor and the survey corridor on Forest Service surface; however, the survey corridor on Forest Service surface and the actual Forest Service surface displayed don't match.	This comment is no longer applicable. Survey results for USFS lands are included in the updated Class III inventory report in Section 5.5.	N/A
o Sites 32MZ2347 (Historical Archaeological) and 32MZ3278 (Cairn) are located immediately adjacent to the survey corridor but are not discussed. Please discuss.	Based on route modifications, 32MZ3278 was visited in 2020 and the site boundary expanded based on the findings. A discussion of the site is provided in the updated Class III report. 32MZ2347 is outside the inventory corridor for the Project; however, we have included a discussion of this site in the Class III inventory report.	Section 5.5
o Site 32MZ145 site form update does not appear to have been performed. Why? Was an attempt made to actually relocate the site? Also, according to the site form, a THPO representative requested avoidance in 2013. More work on this site is probably needed.	When 32MZ145 was first recorded in 1979, it was characterized as two stone cairns. Subsequent investigations described the site as consisting of a single historic rock clearing pile on the west side of Highway 1806, noting that the second pile was likely destroyed by construction of the highway. ERM's survey in 2019 was limited to the east side of Highway 1806, which explains why we did not relocate the site at that time. In 2020, ERM conducted additional survey on USFS lands, examining a corridor on the west side of Highway 1806. 32MZ145 was relocated as a result of this work. The site is discussed in the updated Class III report. Tribal cultural specialists who accompanied ERM during the 2020 field investigation concurred that 32MZ145 is historic rock clearing pile.	Section 5.5

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
o Site 32MZ2346 and 32MZ144: it is very improbable and therefore suspicious that there are zero artifacts and one artifact respectively at sites with historic dumps.	Sites 32MZ2346 and 32MZ144 are both previously recorded historic sites which ERM revisited and recorded during the survey for the Project. Cultural material was observed at both sites as described in the updated Class III report. ERM expanded the boundaries of 32MZ2346 to encompass two previously unreported features at the site. One artifact–a commemorative coin–was collected from 32MZ2346 because of its uniqueness. No artifacts were collected from 32MZ144. Expanded descriptions of both sites are provided in the updated Class III report.	Section 5.5
o Additional survey is shown as needed near site 32MZ3278 on the maps in the overall Class III report but not in the Forest Service stand-alone report. Please include this in the stand-alone Forest Service report.	Additional survey was completed in 2020 on USFS lands in the vicinity of 32MZ3278, which was relocated. A description of the site is provided in the updated Class III report.	Section 5.5
o The recommended avoidance and fencing measures are inadequate, especially for stone feature sites.	All stone feature sites have been avoided with a minimum buffet of 50 ft. Additionally, for sites between 50 and 100 ft of Project workspace WBI Energy commits to fencing and monitoring the sites during construction. WBI Energy will provide a monitoring plan for agency review.	Section 5.5
o A monitoring plan is needed.	WBI Energy commits to providing a construction monitoring plan as discussed in the updated Class III report.	
o Updates should have been conducted for all sites, site leads, and IFs [isolated finds] regardless of whether or not they were relocated.	Site form updates have been submitted for all applicable sites, isolated finds, and site leads discussed in the report	N/A
o The discussion of site leads during fieldwork is inadequate.	Site leads are discussed in Section 5.6 of the updated Class III report.	Section 5.6
o Provide specific distances between site boundaries and the edge of the workspace.	Distances between sites and Project workspaces have been added to summary tables and site descriptions throughout the updated Class III report.	Sections 5.3 through 5.5
o Provide a map of shovel testing performed outside of site boundaries. The report explains the testing strategy during survey but never discusses or shows specifics except within site boundaries.	The route maps provided as Appendix B depict survey methodology in addition to survey coverage and results.	Appendix B
o Identify the level of tribal involvement in the survey.	Tribal participation in field surveys is discussed in Sections 4 and 5.3 through 5.5 of the updated Class III report.	Sections 4 and 5.3 through 5.5
o Discuss whether indirect effects to archaeological sites were considered.	For unevaluated sites, we have added an assessment of non-physical impacts on setting.	Sections 5.3 through 5.5

NORTH BAKKEN EXPANSION PROJECT

Agency Correspondence – U.S. Fish and Wildlife Service (FWS)

Andrea Thornton

From: Justin Moffett
Sent: Tuesday, August 11, 2020 3:42 PM
To: Jerry D. Reinisch (jerry_reinisch@fws.gov)
Cc: Andrea Thornton
Subject: WBI Energy: North Bakken Expansion Project update

Jerry,
I spoke to Andrea Thornton (PM) regarding your question about anticipated changes to the North Bakken Expansion Project and if/how they would involve the U.S. Fish and Wildlife Service. She indicated there have been two recent developments with the project, only one of which (#2 below) would involve USFWS.

1. Last month WBI filed an amendment with FERC announcing they intend to decrease the design capacity of the North Bakken Expansion Project to 250 MMcf/d by reducing compression at the Tioga Compression station. This amendment would not result in any substantive change to the scope of the environmental review since the decreased capacity would not changing the pipeline diameter or project footprint. Therefore this change does not require any additional review or consultation from USFWS.
2. WBI intends to submit a supplemental filing to FERC in late August/early September which is needed to address numerous minor route adjustments WBI has incorporated into the project design to address landowner requests and avoid sensitive resources such as cultural sites and Dakota skipper habitat. The supplemental filing will include submitting updated versions of applicable sections of the Resource Reports, biological assessment, biological and cultural survey reports, and other documents related to the project's environmental review. Once WBI submits the supplemental filing, FERC will review and update the Environmental Assessment and USFWS will have an opportunity to review the updated biological assessment which will allow WBI/FERC and USFWS to complete the project's Section 7 ESA consultation.

Let me know if you have any additional questions.
Thanks.

Justin T. Moffett, PWS
Principal Consultant

Thank you for getting these back to me so quickly! I will share these with WBI. Based on your email below, would WBI need the compatibility determination if the route still crosses the tiny wetland? I'm confident that the larger wetland can be avoided, but the smaller one may be trickier.

Andrea,

Here are shapefiles for the wetland basins in the area we've been discussing. These are just approximate boundaries for these basins but it should give you a pretty good idea of the basin sizes.

Also, the very tiny wetland that the line appears to cross isn't so much of a concern for us. The main concern is the bigger wetland that the line skirts along. It looks like a very slight shift to the west and then precautions to avoid driving machinery through the basin would be enough to avoid that wetland. Please let me know your thoughts after you've had time to look at the shapefiles.

Subject: RE: [EXTERNAL] WBI Energy North Bakken Expansion Project

Hi Jacob and Scott –

Scott had provided the attached shapefile to me back in September 2019 after I mentioned that our civil and environmental survey crews did not notice any wetland basins in certain areas during surveys and aerial photography that we have in our GIS database is not showing the basins like they are depicted on the maps you sent.

If my memory serves correctly he only digitized those that were in question as being crossed by the previous route. Would we be able to receive shapefiles of the basins you mentioned yesterday so they can be avoided?

Thanks again,
Andrea

Subject: Re: [EXTERNAL] WBI Energy North Bakken Expansion Project

Andrea,

Attached are two maps that were sent to WBI in the past. The first map (15709523.jpg) shows the wetland I mentioned in my previous email, as an identified protected wetland basin. There's a call out box pointing to it with the bore/avoid suggestion. The map also shows a tiny wetland that is completely covered by the route and work area in the map I just sent you. You can see it just to the NW of the larger basin we've been discussing. It also has a call out box pointing to it. This map was sent in March of 2019.

The second map (15709523_2.jpg) shows a reroute where both of those wetlands appear to be avoided. That map was sent in August of 2019.

The reason for sending you those maps is to show you we had those identified as protected basins from the beginning. Certainly not trying to pull the rug out from under you here.
So with the reroute, if either of these two wetlands are going to be impacted, we'd have to go through the compatibility process prior to development. This process would decide whether or not the project would be allowed to proceed as planned. It is not a quick process and most companies choose to avoid it whenever possible. We don't have a choice in this matter unfortunately. Whenever our easement interests are projected to be impacted from some time of development (aside from mineral development) we have to go through this process. If you decide to pursue this route, I can give you further details, but basically the request has to go all the way through our regional office.

Boring under or avoiding the basins with the route and machinery would be the other options. Particularly the larger wetland. It appears it wouldn't take much shifting to avoid that wetland.

Let me know your thoughts when you get the chance.

Hi Jacob –

Thanks for getting back to me so quickly. Our survey crews did not identify a wetland in the area you outlined in your attachment and that location is not proposed to be crossed with a bore. In the screenshot below the red outline is the edge of our survey corridor. The route shifted east here due to other routing constraints being identified to the west.

Let me know if you would like to have a call to discuss.

Hello Andrea,

I'm attaching a map with the new shapefiles you've provide. The bore you're asking about looks good to me. As long as the basin is avoided with machinery, everything should be fine there. However with this section of the line being shifted slightly to the east, it does come within a very close proximity to a different wetland. I believe previous proposals for this line avoided this wetland but I'm not sure now. I've made a note of it on the map. Is this also a bore area? Thanks for your help.

Hi Jacob –

I hope that you are doing well. Since our last communication back in March there have been some route adjustments along the North Bakken Expansion Project. I've attached the current shapefiles. There is now one basin that will be crossed using the bore construction method (see screenshot below). I wanted to confirm if there are any additional measures that need to be taken into account by WBI during construction in this area. In the screenshot the green polygon is our field delineated wetland boundary. This wetland is on parcel 157-95-23-004.

Please let me know if there are any questions or concerns.

Thanks,
Andrea

Hi Jacob and Scott –

We have a couple of questions regarding some of the basins identified on the easements attached maps. Our civil and environmental survey crews did not notice any wetland basins in these areas during surveys this summer, and aerial photography that we have in our GIS database is not showing the basins like they are depicted on the maps you sent. Do you have shapefiles of the extend of the basins (rather than just point data) so we can design workspaces appropriately to avoid these areas?

Thanks,
Andrea

North Dakota Field Office
3425 Miriam Avenue
Bismarck, ND 58501-7926 (P: 701-250-4402)

Re: WBI Energy Transmission, Inc. – North Bakken Expansion Project
Biological Assessment

Dear Field Supervisor,

As required by Title 18 Code of Federal Regulations §380.12, WBI Energy Transmission Inc. (WBI Energy) has prepared Environmental Reports in support of its application to the Federal Energy Regulatory Commission (FERC or Commission) for a Certificate of Public Convenience and Necessity under section 7(c) of the Natural Gas Act to construct, modify, operate and maintain the proposed facilities. WBI Energy is the Project Applicant and is also acting as FERC's non-federal representative for the purpose of complying with Section 7(a) of the Endangered Species Act of 1973 (ESA). WBI Energy and WBI Transmission have retained Environmental Resources Management (ERM) to assist with aspects of the proposed Projects including consultations with the U.S. Fish and Wildlife Service (FWS) under the ESA.

WBI Energy wishes to informally consult with your office concerning the impacts of the Project. WBI Energy requests your comments if you agree or disagree with WBI Energy's evaluation of the effects of the proposed action on the following:

- Endangered, threatened, or candidate species, or their designated critical habitats as identified in the ESA;
- Bald and Golden Eagles; and
- Migratory Birds

WBI Energy proposes to install approximately 93.5 miles of pipeline, including new pipeline, pipeline looping and upgrades to existing pipelines, as well as construction and upgrades to compressor stations and other appurtenances to transport natural gas from WBI Energy's existing Tioga Compressor Station near Tioga, Williams County, North Dakota, to a new interconnect with Northern Border's mainline southeast of Watford City, McKenzie County, North Dakota. Pipeline construction is currently planned to begin in May of 2021. The Project would include the crossing of Lake Sakakawea and adjacent U.S. Army Corps of Engineers (USACE) land, as well as the crossing of approximately 2.1 miles of U.S. Forest Service (USFS)-managed lands within the Little Missouri National Grassland.

The purpose of the Project is to provide additional capacity necessary for the transportation of incremental natural gas volumes from the Bakken region of northwest North Dakota to Northern Border's existing mainline for transit on that system. The Project would help to satisfy natural gas demand in the midcontinent region of the United States, and the proposed transportation capacity of the Project is at least an additional 250 million cubic feet per day.

Construction of the proposed 12-inch-diameter Line Section 25 and Line Section 30 Loops and the 20-inch-diameter Tioga Compressor Lateral would require a standard 75-foot-wide construction right-of-way. Except across USFS lands, construction of the proposed Elkhorn Creek-Northern Border pipelines would require a 100-foot-wide construction right-of-way. The USFS land crossing would require a 50-foot wide construction right-of-way with an additional 25 feet of additional temporary workspace (ATWS). Construction of the Project would affect approximately 1,470.3 acres of land, including the pipeline construction rights-of-way, ATWS, staging areas, temporary and permanent access roads, and aboveground facilities. Following construction, approximately 875.4 acres, including the temporary construction right-of-way, ATWS, staging areas, temporary access roads, and temporary workspace at aboveground facility sites, will revert to preconstruction conditions and uses. The remaining approximately 594.9 acres, including the permanent pipeline easements, permanent aboveground facility sites, and permanent access roads, would be retained for operation of the Project facilities.

On behalf of WBI Energy, ERM conducted a species determination based on the results of habitat surveys conducted by Western Ecosystems Technology, Inc. (WEST) and Beaver Creek Archaeology (BCA). As a result of these surveys and subsequent reports, WBI Energy has reached the following determinations:

North Bakken Expansion Project
Summary of Determination for Threatened and Endangered Species and Designated Critical Habitat

		Effects Determinations		
			Action area within Federal Lands	
Species/Critical Habitat	Federal Status [a]	Entire Action area [b]	USACE Areas [b]	USFS Areas [b]
Gray wolf (*Canis lupus*)	E	NE	NE [c]	NE [c]
Interior least tern (*Sterna antillarum athalassos*)	E [d]	NLAA	NLAA	NE
Pallid sturgeon (*Scaphirhynchus albus)*	E	NLAA	NLAA	NE
Whooping crane (*Grus americana*)	E	NLAA	NE	NLAA
Dakota skipper (*Hesperia dacotae*)/DCH	T	NLAA/NE	NE/NE	NLAA/NE
Northern long-eared bat (*Myotis septentrionalis*)	T	NLAA	NLAA	NLAA
Piping plover (*Charadrius melodus*)/DCH	T	NLAA/NAM	NLAA/NAM	NE/NE
Rufa red knot (*Calidris canutus rufa*)	T	NE	NE	NE

[a] Federal Status Codes: E = federally listed endangered; T = federally listed threatened; DCH = designated critical habitat; NAM=Not adversely modify

[b] Effects Determination Codes: NE = No Effect; NLAA = Not Likely to Adversely Affect; LAA = Likely to Adversely Affect

[c] Species was not listed in FWS IPaC report, and is not considered to be present within the *action area* on USACE or USFS-managed lands.

[d] Proposed for delisting.

Additionally, no eagles or eagle nests were identified during Project surveys. If an eagle nest is identified near the Project during construction, WBI Energy would implement the measures described in the FWS' 2007 National Bald Eagle Management Guidelines to avoid and minimize impacts on nesting eagles. The proposed Project is not expected to affect bald or golden eagles.

The Biological Assessment also states that by implementing certain proposed mitigation and restoration measures, no substantial changes in migratory bird habitat availability or suitability are anticipated as a result of the Project. As such, the Project is not expected to result in adverse permanent or cumulative impacts on migratory birds; however, temporary impacts on migratory bird habitat could occur.

WBI Energy appreciates your assistance and review of the enclosed materials and should you have questions or require additional information during your review, please contact Jill Linn (406) 359-7332.

Respectfully submitted,

Jill Linn

NORTH BAKKEN EXPANSION PROJECT

Agency Correspondence – U.S. Department Of Agriculture, Natural Resource Conservation Service (NRCS)

Andrea Thornton

From: Mike Buckless
Sent: Tuesday, August 18, 2020 2:18 PM
To: Teets, Tighe - NRCS, Stanley, ND
Subject: RE: WBI Energy Seed Mix Review - Mountrail County

Good afternoon Tighe,

The WBI Energy project is currently under review by the Federal Energy Regulatory Commission (FERC) as part of the application process. We have a supplemental information report we were going to file with FERC soon; therefore, I am reaching out again to see if there is any update we could provide regarding NRCS consultation in that filing. Any additional information your office or the State Rangeland Supervisor could provide would be much appreciated.

Thank you in advance,

Mike Buckless

Subject: RE: WBI Energy Seed Mix Review - Mountrail County

Good morning,

Just following up on our previous correspondence to see if you had any additional input. We received some information back from another NRCS field office (Mr. Crosby of the Bowbells FO) that was very helpful. If you determine that this information is also applicable to your area, we can incorporate that information.

Thanks again, and happy new year.

Subject: RE: WBI Energy Seed Mix Review - Mountrail County

Thanks for the quick response Tighe,

We are still preparing our application to the Federal Energy Regulatory Commission (FERC), so we have a bit of time. If possible, we were hoping for a response sometime by the end of October. Please let me know if that is something you would be able to accommodate.

Mike

I received your email request. When I get time, I will look at your proposed mixes. I am the only one in my office currently for NRCS, so it's hard to find the time. I will do my best and get back to you. What is the time frame you need this. I'm assuming no restoration and grass seeding would happen until spring 2020.

Subject: WBI Energy Seed Mix Review - Mountrail County

Good morning Mr. Teets,

ERM is preparing environmental review documents on behalf of WBI Energy Transmission, Inc. for a development project affecting land in Mountrail County, ND. We respectfully request your review and comments on the proposed

seed-mixes for use during restoration of the construction work area. Please see the attached document for the proposed seed-mixes and additional background information.

Your time and assistance is greatly appreciated. Please feel free to reach out to myself or Andrea Thornton (cc'd) if you have any questions.

Hello Todd –

I hope you are doing well. Since we last communicated back in March there have been some route adjustments on the North Bakken Expansion Project. I do not believe any easements are impacted by these changes, but would your be able to review and confirm?

Please let me know if there are any questions.

Thanks,
Andrea

Good Morning –

My name is Andrea Thornton and I work for ERM, the environmental consultant working with WBI Energy on the North Bakken Expansion Project. I had been working on and off with Todd Hagel on his of review of NRCS easements. Yesterday I sent him the attached updated project shapefiles for review and received the automatic reply email below. Are you able to assist with this review, or let me know if there is someone else that I should be reaching out to? For your reference I've also attached an email chain between myself and Todd.

Please let me know if you have any questions.

Thanks,
Andrea

Subject: North Bakken Expansion Project- HDD Drilling Fluid Disposal

CAUTION: This email originated from an outside source. Do not click links or open attachments unless you know they are safe.

Hi Pete –

Thanks for chatting earlier. As we discussed I'm looking to find information on the permitting requirements associated with the disposal of HDD drilling fluid. There are currently no additives proposed, however the HDD contractor notes that additives may be deemed necessary based on evaluations and recommendations made by the Mud Technician during drill and hole-opening operations to maintain adequate fluid rheology down-hole. WBI is hoping to find an landowner who would "land farm" the drilling fluid and I'm not sure if there are permit requirements for this activity.

Thanks again,
Andrea

NORTH BAKKEN EXPANSION PROJECT
CONFERENCE CALL NOTES

MEETING TOPIC:
North Bakken Expansion Project – HDD Fluid Disposal

DATE OF MEETING:
August 14, 2020 at 1:30 p.m. PST– Project Call

ATTENDEES:

Environmental Resources Management (ERM)
Andrea Thornton

North Dakota Department of Environmental Quality (NDDEQ)
Brad Torgerson

MEETING NOTES:

Brad Torgerson called Andrea Thornton to discuss the disposal of HDD drilling fluid during construction. Mr. Torgerson noted that liquids are not allowed at landfills and in the past the NDDEQ has not required these drilling fluids to be disposed of at other disposal facilities. He noted that as long as WBI Energy has landowner approval, any drilling additives meet drinking water quality regulations, and best management practices are used to control runoff that no permits are required. Ms. Thornton thanked Mr. Torgerson for the information and indicated that she would follow-up with an email of potential additives.

Andrea Thornton

Subject: HDD Drilling Fluid Disposal
Attachments: Potential Additives HDD Drilling Fuid.pdf

Hi Brad –

Thanks for chatting earlier today about requirements for the disposal of HDD drilling fluids. Attached is a list of the potential additives that the drilling contractor has come up with, along with their Material Safety Datasheets. If any of these additives are problematic please let us know and we can relay that information back to Michels (drilling contractor).

Thanks again,
Andrea

3.1 Substances

Component	CAS-No	Weight % - range
Carboxymethylcellulose sodium salt	9004-32-4	99

3.2 Mixtures

Not Applicable

4. First aid measures

4.1 Description of first-aid measures

Inhalation — If inhaled, remove from area to fresh air. Get medical attention if respiratory irritation develops or if breathing becomes difficult.

Ingestion — Rinse mouth. Do not induce vomiting without medical advice. Never give anything by mouth to an unconscious person. Seek medical attention if irritation occurs.

Skin contact — Wash off immediately with soap and plenty of water removing all contaminated clothes and shoes. Get medical attention immediately if symptoms occur.

Eye contact — Promptly wash eyes with lots of water while lifting eye lids. Remove contact lenses. Continue to rinse for at least 15 minutes. Get medical attention if any discomfort continues.

4.2 Most important symptoms and effects, both acute and delayed

General advice — The severity of the symptoms described will vary dependant of the concentration and the length of exposure. If adverse symptoms develop, the casualty should be transferred to hospital as soon as possible.

Main symptoms

Inhalation	Please see Section 11. Toxicological Information for further information.
Ingestion	Please see Section 11. Toxicological Information for further information.
Skin contact	Please see Section 11. Toxicological Information for further information.
Eye contact	Please see Section 11. Toxicological Information for further information.

4.3 Indication of any immediate medical attention and special treatment needed

Notes to physician Treat symptomatically.

5. Fire-fighting measures

5.1 Extinguishing media

Suitable extinguishing media
Water Fog, Alcohol Foam, CO_2, Dry Chemical.

Extinguishing media which shall not be used for safety reasons
None known.

5.2 Special hazards arising from the substance or mixture

Unusual fire and explosion hazards
Suspended dust may present a dust explosion hazard.

Hazardous combustion products
Carbon oxides (COx).

5.3 Advice for firefighters

Special protective equipment for fire-fighters
As in any fire, wear self-contained breathing apparatus and full protective gear.

Special Fire-Fighting Procedures
Containers close to fire should be removed immediately or cooled with water.

6. Accidental release measures

6.1 Personal precautions, protective equipment and emergency procedures

Extinguish all ignition sources. Avoid sparks, flames, heat and smoking. Evacuate personnel to safe areas. Use personal protective equipment. See also section 8. If spilled, take caution, as material can cause surfaces to become very slippery.

6.2 Environmental precautions

The product should not be allowed to enter drains, water courses or the soil.

Environmental exposure controls
Avoid release to the environment.

6.3 Methods and materials for containment and cleaning up

Methods for containment
Prevent further leakage or spillage if safe to do so.

Methods for cleaning up
Sweep up and shovel into suitable containers for disposal. After cleaning, flush away traces with water. Material becomes slippery when wet. Use caution if wet.

6.4 Reference to other sections

See section 13 for more information.

7. Handling and storage

7.1 Precautions for safe handling

Handling
Handle in accordance with good industrial hygiene and safety practice. Avoid contact with skin and eyes. Avoid dust formation.

Hygiene measures
Use good work and personal hygiene practices to avoid exposure. Do not eat, drink or smoke when using this product.

7.2 Conditions for safe storage, including any incompatibilities

Technical measures/precautions Ensure adequate ventilation. Provide appropriate exhaust ventilation at places where dust is formed. Keep airborne concentrations below exposure limits.

Storage precautions Keep away from open flames, hot surfaces and sources of ignition. Keep containers tightly closed in a dry, cool and well-ventilated place.

8. Exposure controls/personal protection

8.1 Control parameters

Exposure limits Control as an ACGIH particulate not otherwise specified (PNOS): 10 mg/m^3 (Inhalable); 3 mg/m^3 (Respirable) and an OSHA particulate not otherwise regulated (PNOR): 15 mg/m^3 (Total); 5 mg/m^3 (Respirable).

Component	ACGIH TLV	OSHA PEL
Carboxymethylcellulose sodium salt 9004-32-4 (99)	Not Determined	Not Determined

8.2 Exposure controls

All chemical Personal Protective Equipment (PPE) should be selected based on an assessment of both the chemical hazard present and the risk of exposure to those hazards. The PPE recommendations below are based on an assessment of the chemical hazards associated with this product. Where this product is used in a mixture with other products or fluids, additional hazards may be created and as such further assessment of risk may be required. The risk of exposure and need of respiratory protection will vary from workplace to workplace and should be assessed by the user in each situation.

Engineering measures to reduce exposure
Ensure adequate ventilation.

Personal protective equipment

Eye protection It is good practice to wear goggles when handling any chemical. Tightly fitting safety goggles.

Hand protection Wear chemical resistant gloves such as nitrile or neoprene.

Respiratory protection	All respiratory protection equipment should be used within a comprehensive respiratory protection program that meets the requirements of 29 CFR 1910.134 (U.S. OSHA Respiratory Protection Standard) or local equivalent. If exposed to airborne mist/aerosol of this product, use at least a NIOSH-approved N95 half-mask disposable or re-usable particulate respirator. In work environments containing oil mist/aerosol, use at least a NIOSH-approved P95 half-mask disposable or reuseable particulate respirator. If exposed to vapors from this product use a NIOSH/MSHA-approved respirator with an Organic Vapor cartridge.
Skin and body protection	Wear suitable protective clothing.
Hygiene measures	Wash hands before eating, drinking or smoking, Remove and wash contaminated clothing before re-use.

9. Physical and chemical properties

9.1 Information on basic physical and chemical properties

Physical state	Solid powder
Appearance	Opaque
Odor	Mild Odorless
Color	Off-white - Tan
Odor threshold	Not applicable

Property	**Values**	**Remarks**
pH	No information available	
pH @ dilution	6.5-8.0 @ 1% in H2O	
Melting/freezing point		
Boiling point/range	No information available	
Flash point	Does not flash	
Evaporation rate (BuAc =1)		
Flammability (solid, gas)	Not Applicable	
Flammability Limits in Air		
Upper flammability limit	Not applicable	
Lower flammability limit	Not applicable	
Vapor pressure	0 mmHg	
Vapor density	Not applicable	
Specific gravity	1.5 - 1.6	
Bulk density	No information available	
Relative density	No information available	
Water solubility	Gels on contact with water	
Solubility in other solvents	No information available	
Autoignition temperature	No information available	
Decomposition temperature	No information available	
Kinematic viscosity	No information available	
Dynamic viscosity	No information available	
Log Pow	Not determined	
Explosive properties	Not Applicable	
Oxidizing properties	None known.	

9.2 Other information

Pour point	No information available
Molecular weight	No information available
VOC content(%)	None
Density	No information available

10. Stability and reactivity

10.1 Reactivity

No specific reactivity hazards associated with this product.

10.2 Chemical stability

Stable under normal temperature conditions and recommended use.

10.3 Possibility of Hazardous Reactions

Hazardous polymerization
Hazardous polymerization does not occur.

Hazardous Reactions
None known.

10.4 Conditions to avoid

Heat, flames and sparks.

10.5 Incompatible materials

Strong oxidizing agents.

10.6 Hazardous decomposition products

Carbon oxides (COx).

11. Toxicological information

11.1 Information on toxicological effects

Acute toxicity

Inhalation — Inhalation of dust may cause shortness of breath, tightness of the chest, a sore throat and cough.

Eye contact — Dust may cause mechanical irritation.

Skin contact — Repeated exposure may cause skin dryness or cracking.

Ingestion — Irritant; may cause pain or discomfort to mouth, throat and stomach.

Acute toxicity — 0% of the mixture consists of ingredient(s) of unknown toxicity.

Component	LD50 Oral	LD50 Dermal	LC50 Inhalation
Carboxymethylcellulose sodium salt	= 27000 mg/kg (Rat)	> 2 g/kg (Rabbit)	> 5800 mg/m³ (Rat) 4 h

Sensitization — This product does not contain any components suspected to be sensitizing.

Mutagenic effects — This substance has no evidence of mutagenic properties.

Carcinogenicity — This substance has no evidence of carcinogenic properties.

Reproductive toxicity	None known.
Developmental toxicity	Not known to cause birth defects or have a deleterious effect on a developing fetus.
Routes of exposure	Inhalation. Skin contact. Eye contact.
Routes of entry	None known.
Specific target organ toxicity (single exposure)	Not classified
Specific target organ toxicity (repeated exposure)	Not classified.
Aspiration hazard	Not Applicable.

12. Ecological information

12.1 Toxicity

Toxicity to algae
See component information below.

Toxicity to fish
See component information below.

Toxicity to daphnia and other aquatic invertebrates
See component information below.

Component	Toxicity to fish	Toxicity to algae	Toxicity to daphnia and other aquatic invertebrates
Carboxymethylcellulose sodium salt	No information available	No information available	No information available

12.2 Persistence and degradability

No product level data available.

12.3 Bioaccumulative potential

No data available.

12.4 Mobility in soil

No information available.

12.5 Results of PBT and vPvB assessment

This substance is not considered to be persistent, bioaccumulating or toxic (PBT)
This substance is not considered to be very persistent nor very bioaccumulating (vPvB)

12.6 Other adverse effects.

None known. Check for additional information in sect. 7.

13. Disposal considerations

13.1 Waste treatment methods

Waste from residues / unused products	Dispose of in accordance with local regulations.
Contaminated packaging	Empty containers should be taken for local recycling, recovery or waste disposal.

14. Transport information

14.1 UN Number

UN/ID No. (ADR/RID/ADN/ADG)	Not regulated
UN No. (IMDG)	Not regulated
UN No. (ICAO)	Not regulated
UN No. (DOT)	Not regulated

14.2 Proper shipping name

Not regulated for transportation by DOT, TDG, IMDG and ICAO/IATA.

Safety Data Sheet
PLATINUM PAC† UL

1. Identification

1.1 Product identifier

Product name PLATINUM PAC† UL

Product code 12481

1.2 Relevant identified uses of the substance or mixture and uses advised against

Recommended Use Drilling fluid additive.

Uses advised against Consumer use

1.3 Details of the supplier of the safety data sheet

Supplier
M-I L.L.C.
P.O.Box 42842
Houston, TX 77242
www.miswaco.slb.com

Prepared by
Global Chemical Regulatory Compliance (GCRC) , Bethicia Prasek

1.4 Emergency Telephone Number

Emergency telephone (24 Hour) Australia +61 2801 44558, Asia Pacific +65 3158 1074, China +86 10 5100 3039, Europe +44 (0) 1235 239 670, Middle East and Africa +44 (0) 1235 239 671, New Zealand +64 9929 1483, USA 001 281 561 1600
Telephone Number - 281-561-1511

2. Hazards identification

2.1 Classification of the substance or mixture

GHS - Classification

Health hazards Not classified

Environmental hazards Not classified

Physical Hazards

Combustible dust	-

2.2 Label elements

Signal word
WARNING

May form combustible dust concentrations in air

Precautionary statements
P240 - Ground/bond container and receiving equipment
P243 - Take precautionary measures against static discharge

P241 - Use explosion-proof electrical/ ventilating/ lighting/ equipment

Unknown acute toxicity 0% of the mixture consists of ingredient(s) of unknown toxicity.

3. Composition/information on Ingredients

3.1 Substances

Not Applicable

3.2 Mixtures

Component	CAS-No	Weight % - range
Carbohydrate	Proprietary	60 - 100

Comments
The exact percentage (concentration) of composition has been withheld as a trade secret

4. First aid measures

4.1 First-Aid Measures

Inhalation If inhaled, remove from area to fresh air. Get medical attention if respiratory irritation develops or if breathing becomes difficult.

Ingestion Rinse mouth. Do not induce vomiting without medical advice. Never give anything by mouth to an unconscious person. Seek medical attention if irritation occurs.

Skin contact Wash off immediately with soap and plenty of water removing all contaminated clothes and shoes. Get medical attention immediately if symptoms occur.

Eye contact Promptly wash eyes with lots of water while lifting eye lids. Remove contact lenses. Continue to rinse for at least 15 minutes. Get medical attention if any discomfort continues.

4.2 Most important symptoms and effects, both acute and delayed

General advice	The severity of the symptoms described will vary dependant of the concentration and the length of exposure. If adverse symptoms develop, the casualty should be transferred to hospital as soon as possible.
Main symptoms	
Inhalation	Please see Section 11. Toxicological Information for further information.
Ingestion	Please see Section 11. Toxicological Information for further information.
Skin contact	Please see Section 11. Toxicological Information for further information.
Eye contact	Please see Section 11. Toxicological Information for further information.

4.3 Indication of any immediate medical attention and special treatment needed

Notes to physician Treat symptomatically

5. Fire-fighting measures

5.1 Extinguishing media

Suitable extinguishing media
Water Fog, Alcohol Foam, CO_2, Dry Chemical.

Extinguishing media which shall not be used for safety reasons
None known.

5.2 Special hazards arising from the substance or mixture

Unusual fire and explosion hazards
Suspended dust may present a dust explosion hazard.

Hazardous combustion products
Carbon oxides (COx).

5.3 Advice for firefighters

Special protective equipment for fire-fighters
As in any fire, wear self-contained breathing apparatus and full protective gear.

Special Fire-Fighting Procedures
Containers close to fire should be removed immediately or cooled with water.

6. Accidental release measures

6.1 Personal precautions, protective equipment and emergency procedures

Extinguish all ignition sources. Avoid sparks, flames, heat and smoking. Evacuate personnel to safe areas. Use personal protective equipment. See also section 8. If spilled, take caution, as material can cause surfaces to become very slippery.

6.2 Environmental precautions

As local regulations may vary; all waste must be disposed/recycled/reclaimed in accordance with federal, state, and local environmental control regulations.

Environmental exposure controls
Avoid dust formation.

6.3 Methods and materials for containment and cleaning up

Methods for containment
Prevent further leakage or spillage if safe to do so.

Methods for cleaning up
Sweep up and shovel into suitable containers for disposal. After cleaning, flush away traces with water. Material becomes slippery when wet. Use caution if wet.

6.4 Reference to other sections

See section 13 for more information.

7. Handling and storage

7.1 Precautions for safe handling

Handling
Handle in accordance with good industrial hygiene and safety practice. Avoid contact with skin and eyes. Avoid dust formation.

Hygiene measures
Use good work and personal hygiene practices to avoid exposure. Do not eat, drink or smoke when using this product.

7.2 Conditions for safe storage, including any incompatibilities

Technical measures/precautions Ensure adequate ventilation. Provide appropriate exhaust ventilation at places where dust is formed. Keep airborne concentrations below exposure limits.

Storage precautions Keep away from open flames, hot surfaces and sources of ignition. Keep containers tightly closed in a dry, cool and well-ventilated place.

8. Exposure controls/personal protection

8.1 Control parameters

Exposure limits **Control as an ACGIH particulate not otherwise specified (PNOS): 10 mg/m³ (Inhalable); 3 mg/m³ (Respirable) and an OSHA particulate not otherwise regulated (PNOR): 15 mg/m³ (Total); 5 mg/m³ (Respirable).**

Component	ACGIH TLV	OSHA PEL
Carbohydrate	Not Determined	Not Determined

8.2 Exposure controls

All chemical Personal Protective Equipment (PPE) should be selected based on an assessment of both the chemical hazard present and the risk of exposure to those hazards. The PPE recommendations below are based on an assessment of the chemical hazards associated with this product. Where this product is used in a mixture with other products or fluids, additional hazards may be created and as such further assessment of risk may be required. The risk of exposure and need of respiratory protection will vary from workplace to workplace and should be assessed by the user in each situation.

Engineering measures to reduce exposure
Ensure adequate ventilation.

Personal protective equipment

Eye protection	Tightly fitting safety goggles.
Hand protection	Wear chemical resistant gloves such as nitrile or neoprene.
Respiratory protection	All respiratory protection equipment should be used within a comprehensive respiratory protection program that meets the requirements of 29 CFR 1910.134 (U.S. OSHA Respiratory Protection Standard) or local equivalent. If exposed to airborne mist/aerosol of this product, use at least a NIOSH-approved N95 half-mask disposable or re-usable particulate respirator. In work environments containing oil mist/aerosol, use at least a NIOSH-approved P95 half-mask disposable or reuseable particulate respirator. If exposed to vapors from this product use a NIOSH/MSHA-approved respirator with an Organic Vapor cartridge.
Skin and body protection	Wear suitable protective clothing.
Hygiene measures	Wash hands before eating, drinking or smoking, Remove and wash contaminated clothing before re-use.

9. Physical and chemical properties

9.1 Information on basic physical and chemical properties

Physical state	Solid powder
Appearance	Opaque
Odor	Mild Odorless
Color	White - Yellow
Odor threshold	Not applicable

Property	**Values**	**Remarks**
pH		
pH @ dilution	6.5-8.5 @ 1% in H2O	
Melting/freezing point		
Boiling point/range	No information available	
Flash point	Does not flash	
Evaporation rate (BuAc =1)	No information available	
Flammability (solid, gas)	Not Applicable	
Flammability Limits in Air		
Upper flammability limit	No information available	
Lower flammability limit	No information available	
Vapor pressure	0 mmHg	
Vapor density	Not applicable	
Specific gravity	0.3 - 0.5	
Bulk density	No information available	
Water solubility	Soluble in water	
Solubility in other solvents	No information available	
Autoignition temperature	No information available	
Decomposition temperature	No information available	
Kinematic viscosity	No information available	
Dynamic viscosity	No information available	
Log Pow	Not determined	
Explosive properties	Not Applicable	
Oxidizing properties	None known.	

9.2 Other information

Pour point	No information available
Molecular weight	No information available

VOC content(%) None
Density No information available

10. Stability and reactivity

10.1 Reactivity

No specific reactivity hazards associated with this product.

10.2 Chemical stability

Stable under normal temperature conditions and recommended use.

10.3 Possibility of Hazardous Reactions

Hazardous polymerization
Hazardous polymerization does not occur.

Hazardous Reactions
None known.

10.4 Conditions to avoid

Heat, flames and sparks.

10.5 Incompatible materials

Strong oxidizing agents.

10.6 Hazardous decomposition products

Carbon oxides (COx).

11. Toxicological information

11.1 Information on toxicological effects

Acute toxicity

Inhalation Inhalation of dust may cause shortness of breath, tightness of the chest, a sore throat and cough.

Eye contact Dust may cause mechanical irritation.

Skin contact Repeated exposure may cause skin dryness or cracking.

Ingestion Irritant; may cause pain or discomfort to mouth, throat and stomach.

Component	LD50 Oral	LD50 Dermal	LC50 Inhalation
Carbohydrate	= 27000 mg/kg (Rat)	> 2 g/kg (Rabbit)	> 5800 mg/m³ (Rat) 4 h

Component	IARC Group 1 or 2	ACGIH - Carcinogens	OSHA listed carcinogens	NTP
Carbohydrate	No data available	No data available	No data available	No data available

Sensitization This product does not contain any components suspected to be sensitizing.

Mutagenic effects This substance has no evidence of mutagenic properties.

Carcinogenicity	This substance has no evidence of carcinogenic properties.
Reproductive toxicity	None known.
Developmental toxicity	Not known to cause birth defects or have a deleterious effect on a developing fetus.
Routes of exposure	Inhalation. Skin contact. Eye contact.
Routes of entry	None known.
Specific target organ toxicity (single exposure)	Not classified
Specific target organ toxicity (repeated exposure)	Not classified.
Aspiration hazard	Not Applicable.

12. Ecological information

12.1 Toxicity

Toxicity to algae
See component information below.

Toxicity to fish
See component information below.

Toxicity to daphnia and other aquatic invertebrates
See component information below.

Component	Toxicity to fish	Toxicity to algae	Toxicity to daphnia and other aquatic invertebrates
Carbohydrate (60 - 100)	No information available	No information available	No information available

12.2 Persistence and degradability

No product level data available.

12.3 Bioaccumulative potential

No data available.

12.4 Mobility in soil

No information available.

12.5 Results of PBT and vPvB assessment

This substance is not considered to be persistent, bioaccumulating or toxic (PBT)
This substance is not considered to be very persistent nor very bioaccumulating (vPvB)

12.6 Other adverse effects.

None known.

13. Disposal considerations

13.1 Waste treatment methods

Disposal Method Disposal should be made in accordance with federal, state and local regulations.

Contaminated packaging Empty containers should be taken for local recycling, recovery or waste disposal.

14. Transport information

14.1 UN Number

UN/ID No. (ADR/RID/ADN/ADG)	Not regulated
UN No. (IMDG)	Not regulated
UN No. (ICAO)	Not regulated
UN No. (DOT)	Not regulated

14.2 Proper shipping name

Not regulated for transportation by DOT, TDG, IMDG and ICAO/IATA.

14.3 Hazard class(es)

ADR/RID/ADN Hazard class	Not regulated
IMDG Hazard class	Not regulated
ICAO Hazard class/division	Not regulated
DOT Hazard class	Not regulated

14.4 Packing group

ADR/RID/ADN Packing Group	Not regulated
IMDG Packing group	Not regulated
ICAO Packing group	Not regulated
DOT Packing group	Not regulated

Marine pollutant
No

14.6 Special precautions
Not Applicable

15. Regulatory information

15.1 Safety, health and environmental regulations/legislation specific for the substance or mixture

International inventories

USA (TSCA)	Complies
European Union (EINECS and ELINCS)	Complies
Canada (DSL)	Complies
Philippines (PICCS)	Complies
Japan (ENCS)	Complies

China (IECSC)	Complies
Australia (AICS)	Complies
Korean (KECL)	Complies
New Zealand (NZIoC)	Complies

U.S. Federal and State Regulations

SARA 311/312 Hazard Categories
Not a SARA 311/312 hazard.

SARA 302/304, 313, CERCLA RQ, California Proposition 65
Note: If no components are listed below, this product is not subject to the referenced SARA and CERCLA regulations and is not known to contain a Proposition 65 listed chemical at a level that is expected to pose a significant risk under anticipated use conditions.

Component	SARA 302 / TPQs	SARA 313	CERCLA RQ
Carbohydrate	N/A	N/A	N/A

State Comments
Proposition 65: This product is not known to contain chemicals considered by the State of California's Safe Drinking Water and Toxic Enforcement Act of 1986 as causing cancer and/or reproductive toxicity at levels that are expected to pose a significant risk under anticipated use conditions.

Canadian Classification

This product has been classified in accordance with the hazard criteria of the CPR and the SDS contains all the information required by the CPR.

WHMIS Hazard Class Not a controlled product.

16. Other information

Supersedes date 14/Feb/2012

Revision date 08/Jan/2015

3.2 Mixtures

Not Applicable

Comments
No classified ingredients, or those having occupational exposure limits, present above the level of disclosure.

4. First aid measures

4.1 Description of first-aid measures

Inhalation — If inhaled, remove from area to fresh air. Get medical attention if respiratory irritation develops or if breathing becomes difficult.

Ingestion — Rinse mouth. Do not induce vomiting without medical advice. Never give anything by mouth to an unconscious person. Get medical attention if symptoms occur.

Skin contact — Wash off immediately with soap and plenty of water removing all contaminated clothes and shoes. Get medical attention immediately if symptoms occur.

Eye contact — Remove contact lenses. Promptly wash eyes with lots of water while lifting eye lids. Continue to rinse for at least 15 minutes. Get medical attention if any discomfort continues.

4.2 Most important symptoms and effects, both acute and delayed

General advice — The severity of the symptoms described will vary dependant of the concentration and the length of exposure. If adverse symptoms develop, the casualty should be transferred to hospital as soon as possible.

Main symptoms

Inhalation — Please see Section 11. Toxicological Information for further information.

Ingestion — Please see Section 11. Toxicological Information for further information.

Skin contact — Please see Section 11. Toxicological Information for further information.

Eye contact — Please see Section 11. Toxicological Information for further information.

4.3 Indication of any immediate medical attention and special treatment needed

Notes to physician Treat symptomatically.

5. Fire-fighting measures

5.1 Extinguishing media

Suitable extinguishing media
Use extinguishing media appropriate for surrounding material.

Extinguishing media which shall not be used for safety reasons
None known.

5.2 Special hazards arising from the substance or mixture

Unusual fire and explosion hazards
None known.

Hazardous combustion products
Carbon oxides (COx).

5.3 Advice for firefighters

Special protective equipment for fire-fighters
As in any fire, wear self-contained breathing apparatus and full protective gear.

Special Fire-Fighting Procedures
Containers close to fire should be removed immediately or cooled with water.

6. Accidental release measures

6.1 Personal precautions, protective equipment and emergency procedures

Use personal protective equipment. See also section 8.

6.2 Environmental precautions

The product should not be allowed to enter drains, water courses or the soil.

Environmental exposure controls
Avoid release to the environment.

6.3 Methods and materials for containment and cleaning up

Methods for containment
Prevent further leakage or spillage if safe to do so. Dike far ahead of liquid spill for later disposal.

Methods for cleaning up
Absorb with earth, sand or other non-combustible material and transfer to containers for later disposal. After cleaning, flush away traces with water.

6.4 Reference to other sections

See section 13 for more information.

7. Handling and storage

7.1 Precautions for safe handling

Handling
Handle in accordance with good industrial hygiene and safety practice. Avoid contact with skin and eyes. Do not breathe vapors or spray mist. Avoid spills and splashing during use.

7.2 Conditions for safe storage, including any incompatibilities

Technical measures/precautions	Ensure adequate ventilation. Keep airborne concentrations below exposure limits.
Storage precautions	Keep containers tightly closed in a dry, cool and well-ventilated place.
Packaging material	Use specially constructed containers only

8. Exposure controls/personal protection

8.1 Control parameters

Exposure limits The product does not contain any hazardous materials with occupational exposure limits established.

8.2 Exposure controls

All chemical Personal Protective Equipment (PPE) should be selected based on an assessment of both the chemical hazard present and the risk of exposure to those hazards. The PPE recommendations below are based on an assessment of the chemical hazards associated with this product. Where this product is used in a mixture with other products or fluids, additional hazards may be created and as such further assessment of risk may be required. The risk of exposure and need of respiratory protection will vary from workplace to workplace and should be assessed by the user in each situation.

Engineering measures to reduce exposure
Ensure adequate ventilation.

Personal protective equipment

Eye protection	It is good practice to wear goggles when handling any chemical. Tightly fitting safety goggles.
Hand protection	Wear chemical resistant gloves such as nitrile or neoprene.
Respiratory protection	No personal respiratory protective equipment normally required, In case of insufficient ventilation wear suitable respiratory equipment.
Skin and body protection	Wear suitable protective clothing, Provide eyewash station.

Hygiene measures Wash hands before eating, drinking or smoking, Remove and wash contaminated clothing before re-use.

9. Physical and chemical properties

9.1 Information on basic physical and chemical properties

Physical state	Liquid
Appearance	Transparent
Odor	Mild
Color	Light yellow
Odor threshold	Not applicable

Property	Values	Remarks
pH	6 - 8	

pH @ dilution	
Melting/freezing point	
Boiling point/range	90 °C / 194 °F
Flash point	No information available
Evaporation rate (BuAc =1)	
Flammability (solid, gas)	Not Applicable
Flammability Limits in Air	
Upper flammability limit	Not applicable
Lower flammability limit	Not applicable
Vapor pressure	No information available
Vapor density	No information available
Specific gravity	1.27
Bulk density	No information available
Relative density	No information available
Water solubility	Slightly soluble in water.
Solubility in other solvents	No information available
Autoignition temperature	No information available
Decomposition temperature	No information available
Kinematic viscosity	No information available
Dynamic viscosity	No information available
Log Pow	Does not bioaccumulate
Explosive properties	No information available
Oxidizing properties	No information available

9.2 Other information

Pour point	No information available
Molecular weight	No information available
VOC content(%)	No information available
Density	No information available

10. Stability and reactivity

10.1 Reactivity

No specific reactivity hazards associated with this product.

10.2 Chemical stability

Stable under normal temperature conditions and recommended use.

10.3 Possibility of Hazardous Reactions

Hazardous polymerization
Hazardous polymerization does not occur.

10.4 Conditions to avoid

None known.

10.5 Incompatible materials

Strong oxidizing agents.

10.6 Hazardous decomposition products

Carbon oxides (COx).

11. Toxicological information

11.1 Information on toxicological effects

Acute toxicity

Inhalation	Inhalation of vapors in high concentration may cause irritation of respiratory system.
Eye contact	May cause slight irritation.
Skin contact	Prolonged contact may cause redness and irritation.
Ingestion	Ingestion may cause stomach discomfort.
Acute toxicity	0% of the mixture consists of ingredient(s) of unknown toxicity.

Sensitization	This product does not contain any components suspected to be sensitizing.
Mutagenic effects	No evidence of mutagenic properties.
Carcinogenicity	No evidence of carcinogenic properties.
Reproductive toxicity	No evidence of toxicity to reproduction.
Developmental toxicity	Not known to cause birth defects or have a deleterious effect on a developing fetus.
Routes of exposure	Eye contact. Skin contact. Inhalation.
Routes of entry	No route of entry noted.
Specific target organ toxicity (single exposure)	Not classified
Specific target organ toxicity (repeated exposure)	Not classified.
Aspiration hazard	Not Applicable.

12. Ecological information

12.1 Toxicity

Toxicity to algae
See component information below.

Toxicity to fish
See component information below.

Toxicity to daphnia and other aquatic invertebrates
See component information below.

12.2 Persistence and degradability

No product level data available.

12.3 Bioaccumulative potential

No data available.

12.4 Mobility in soil

No information available.

12.5 Results of PBT and vPvB assessment

This preparation contains no substance considered to be persistent, bioaccumulating nor toxic (PBT)
This preparation contains no substance considered to be very persistent nor very bioaccumulating (vPvB)

12.6 Other adverse effects.

None known.

13. Disposal considerations

13.1 Waste treatment methods

Waste from residues / unused products	Dispose of in accordance with local regulations.
Contaminated packaging	Empty containers should be taken for local recycling, recovery or waste disposal.

14. Transport information

14.1 UN Number

UN/ID No. (ADR/RID/ADN/ADG)	Not regulated
UN No. (IMDG)	Not regulated
UN No. (ICAO)	Not regulated
UN No. (DOT)	Not regulated

14.2 Proper shipping name

Not regulated for transportation by DOT, TDG, IMDG and ICAO/IATA.

14.3 Hazard class(es)

ADR/RID/ADN Hazard class	Not regulated
IMDG Hazard class	Not regulated
ICAO Hazard class/division	Not regulated
DOT Hazard class	Not regulated

14.4 Packing group

ADR/RID/ADN Packing Group	Not regulated
IMDG Packing group	Not regulated
ICAO Packing group	Not regulated
DOT Packing group	Not regulated

14.5 Environmental hazard

No

14.6 Special precautions
Not Applicable

15. Regulatory information

15.1 Safety, health and environmental regulations/legislation specific for the substance or mixture

International inventories

USA (TSCA)	Complies
European Union (EINECS and ELINCS)	Does not Comply
Canada (DSL)	Complies

SAFETY DATA SHEET

1. PRODUCT AND COMPANY IDENTIFICATION

Product identifier
Product Code 25392
Product Name **TORQMASTER®**

Other means of identification

Recommended use of the chemical and restrictions on use
Use only for the purpose on the product label.

Details of the supplier of the safety data sheet

Manufacturer / Manufactured For
WYO-BEN
1345 Discovery Dr
Billings, Montana 59102
Phone: 406-652-6351
Emergency telephone number
24 Hour Emergency Phone Number: 1-800-535-5053

2. HAZARDS IDENTIFICATION

This product is not classified according to paragraph (d) of 29 CFR 1910.1200 and does not require a hazard warning label.

Hazard Classification

Acute aquatic toxicity	Category 3
Chronic aquatic toxicity	Category 3

Signal Word
None

Hazard Statements
Harmful to aquatic life with long lasting effects

Hazard Symbol
None

Precautionary Statements - Prevention
Avoid release to the environment.

Precautionary Statements - Response
Specific Treatment (See Section 4 on the SDS).
IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing. If eye irritation persists: Get medical advice/attention.
IF ON SKIN: Wash with plenty of soap and water. Wash contaminated clothing before reuse.
IF INHALED: Remove victim to fresh air and keep at rest in a position comfortable for breathing.
IF SWALLOWED: Rinse mouth. DO NOT induce vomiting. Drink plenty of water.

Precautionary Statements – Storage
Keep out of reach of children.

Precautionary Statements - Disposal
Dispose of contents/container to an approved waste disposal plant.

Hazards not otherwise classified (HNOC)

Other Information

Unknown Acute Toxicity 0.06% of the mixture consists of ingredient(s) of unknown toxicity.

3. COMPOSITION/INFORMATION ON INGREDIENTS

Chemical Name	CAS No.	Weight-%	Trade Secret
PROPRIETARY	Proprietary	1-5	*
Sodium Carbonate	497-19-8	1-5	*

*The exact percentage (concentration) of composition has been withheld as a trade secret.

4. FIRST AID MEASURES

First aid measures

Skin Contact Wash off immediately with soap and plenty of water while removing all contaminated clothes and shoes. Wash contaminated clothing before reuse. If skin irritation persists, call a physician.

Eye contact Immediately flush with plenty of water. After initial flushing, remove any contact lenses and continue flushing for at least 15 minutes. If irritation persists, call a physician.

Inhalation If mists/vapors are formed or irritation occurs, leave area and do not return until mists/vapors have dissipated. If irritation persists, see a physician.

Ingestion Rinse mouth. Do NOT induce vomiting. Never give anything by mouth to an unconscious person. Drink plenty of water. If irritation persists, see a physician.

Most important symptoms and effects, both acute and delayed

Symptoms No Information available.

Indication of any immediate medical attention and special treatment needed

Note to physicians Treat symptomatically.

5. FIRE-FIGHTING MEASURES

Suitable extinguishing media

Use extinguishing measures that are appropriate to local circumstances and the surrounding environment.

Unsuitable extinguishing media

Caution: Use of water spray when fighting fire may be inefficient.

Specific hazards arising from the chemical

No Information available.

Explosion data

Sensitivity to Mechanical Impact None
Sensitivity to Static Discharge None

Protective equipment and precautions for firefighters

As in any fire, wear self-contained breathing apparatus pressure-demand, MSHA/NIOSH (approved or equivalent) and full protective gear.

NFPA **Health Hazard 0** **Fire Hazard 0** **Reactivity 0**

6. ACCIDENTAL RELEASE MEASURES

Personal precautions, protective equipment and emergency procedures

Personal precautions Ensure adequate ventilation, especially in confined areas.

Environmental precautions

Environmental precautions See Section 12 for additional ecological information.

Methods and material for containment and cleaning up

Methods for containment Prevent further leakage or spillage if safe to do so.

Methods for cleaning up Soak up with inert absorbent material. Pick up and transfer to properly labeled containers.

7. HANDLING AND STORAGE

Precautions for safe handling

Advice on safe handling Handle in accordance with good industrial hygiene and safety practice.

Conditions for safe storage, including any incompatibilities

Storage Conditions Keep containers tightly closed in a dry, cool and well-ventilated place.

Incompatible materials None known based on information supplied.

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

Control parameters

Exposure Guidelines This product, as supplied, does not contain any hazardous materials with occupational exposure limits established by the region specific regulatory bodies.

Appropriate engineering controls

Engineering Controls Showers, Eyewash stations & Ventilation systems.

Individual protection measures, such as personal protective equipment

Eye/face protection Wear safety glasses with side shields (or goggles).

Skin and body protection Wear chemical resistant gloves.

Respiratory protection If exposure limits are exceeded or irritation is experienced, NIOSH/MSHA approved respiratory protection should be worn. Positive-pressure supplied air respirators or air purifying respirators may be required for high airborne contaminant concentrations. Respiratory protection must be provided in accordance with current local regulations.

General Hygiene Handle in accordance with good industrial hygiene and safety practice.

9. PHYSICAL AND CHEMICAL PROPERTIES

Information on basic physical and chemical properties

Physical state	Viscous Liquid
Appearance	Pink, Dark
Odor	Mild
Odor threshold	No Information available

Property	Values
pH	9.5 - 11.5
Specific Gravity	1.01
Viscosity	No Information available
Melting point/freezing point	No Information available
Boiling point / boiling range	> 212 / ° F Degrees
Flash point	> 212 / ° F Degrees
Evaporation rate	No Information available
Flammability (solid, gas)	No Information available
Upper flammability limit:	No Information available
Lower flammability limit:	No Information available
Vapor pressure	No Information available
Vapor density	No Information available
Bulk Density Lbs/Gal	No Information available
Water solubility	Complete
Partition Coefficient (n-octanol/water)	No Information available
Autoignition temperature	No Information available
Decomposition temperature	No Information available
VOC Content (%)	No Information available

10. STABILITY AND REACTIVITY

Reactivity
No data available

Chemical stability
Stable under recommended storage conditions.

Possibility of Hazardous Reactions
None under normal processing.

Conditions to avoid
Extremes of temperature and direct sunlight.

Incompatible materials
None known based on information supplied.

Hazardous Decomposition Products
None known based on information supplied.

11. TOXICOLOGICAL INFORMATION

Information on likely routes of exposure

Product Information No data available

Inhalation No data available.

Eye contact No data available.

Skin Contact No data available.

Ingestion No data available.

Chemical Name	Oral LD50	Dermal LD50	Inhalation LC50
Sodium Carbonate 497-19-8	= 4090 mg/kg (Rat)	-	= 2300 mg/m³ (Rat) 2 h

Information on toxicological effects

Symptoms No Information available.

Delayed and immediate effects as well as chronic effects from short and long-term exposure

Sensitization	No Information available.
Germ cell mutagenicity	No Information available.
Carcinogenicity	No Information available.
Reproductive toxicity	No Information available.
STOT - single exposure	No Information available.
STOT - repeated exposure	No Information available.
Aspiration hazard	No Information available.

Numerical measures of toxicity - Product Information

Unknown Acute Toxicity 0.05% of the mixture consists of ingredient(s) of unknown toxicity.
This is based upon values calculated per chapter 3.1 of the GHS document.

12. ECOLOGICAL INFORMATION

Ecotoxicity

0.05% of the mixture consists of components(s) of unknown hazards to the aquatic environment

Chemical Name	Algae/aquatic plants	Fish	Crustacea
PROPRIETARY	-	LC50 Oncorhynchus mykiss, 96 hr.,1.2 mg/L:	LC50 Daphnia sp., 48 hr., 5.3 mg/L
Sodium Carbonate 497-19-8	EC 50 Nitzschia sp.,120 hr.,242 mg/L	LC 50 Lepomis macrochirus, 96 hr., 300 mg/L static LC50 Pimephales promelas, 96 hr., 310 - 1220 mg/L., static	EC50 Daphnia magna, 48 hr., 265 mg/L

Persistence and degradability
No Information available.

Bioaccumulation
No Information available.

Other adverse effects No Information available.

13. DISPOSAL CONSIDERATIONS

Waste treatment methods

Disposal of wastes Disposal should be in accordance with applicable regional, national and local laws and regulations.

Contaminated packaging Do not reuse container.

This product contains one or more substances that are listed with the State of California as a hazardous waste.

Chemical Name	California Hazardous Waste Status
Sodium Carbonate 497-19-8	Corrosive

14. TRANSPORT INFORMATION

The shipping classification information in this section (Section 14) is meant as a guide to the overall classification of the product. However, transportation classifications may be subject to change with changes in package size. Consult shipper requirements under 49 CFR, IATA and IMDG to assure regulatory compliance.

DOT Not regulated

15. REGULATORY INFORMATION

International Inventories

TSCA	Complies
DSL/NDSL	Complies
EINECS/ELINCS	Does not comply
ENCS	Does not comply
IECSC	Does not comply
KECL	Does not comply
PICCS	Does not comply
AICS	Does not comply

Legend:

US Federal Regulations

SARA 313

Section 313 of Title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA). This product does not contain any chemicals which are subject to the reporting requirements of the Act and Title 40 of the Code of Federal Regulations, Part 372.

SARA 311/312 Hazard Categories

Acute health hazard	No
Chronic Health Hazard	No
Fire hazard	No
Sudden release of pressure hazard	No
Reactive Hazard	No

CWA (Clean Water Act)

This product does not contain any substances regulated as pollutants pursuant to the Clean Water Act (40 CFR 122.21 and 40 CFR 122.42).

CERCLA

This material, as supplied, does not contain any substances regulated as hazardous substances under the Comprehensive Environmental Response Compensation and Liability Act (CERCLA) (40 CFR 302) or the Superfund Amendments and Reauthorization Act (SARA) (40 CFR 355). There may be specific reporting requirements at the local, regional, or state level pertaining to releases of this material.

US State Regulations

California Proposition 65

This product does not contain any Proposition 65 chemicals.

U.S. State Right-to-Know Regulations

This product does not contain chemicals subject to Right-To-Know regulations in other states.

U.S. EPA Label Information

EPA Pesticide Registration Number Not Applicable

WYO-BEN, INC.

SAFETY DATA SHEET

SECTION 1 — CHEMICAL PRODUCT AND COMPANY IDENTIFICATION

Product Trade Name:	**PLUGZ-IT™ MAX**
Chemical Family:	Mineral
Application:	Sealing
Manufacturer/Supplier:	Wyo-Ben, Inc. 1345 Discovery Drive Billings, MT 59102 USA Telephone: 800.548.7055 Facsimile: 406.656.0748
Emergency Phone Number	CHEMTREC® 800.424.9300

SECTION 2 — HAZARD IDENTIFICATION

Hazard Symbol: Health Hazard

Signal Word: Warning

Hazard Overview:

ACUTE HEALTH HAZARD
May cause eye and respiratory irritation.

CHRONIC HEALTH HAZARD
Breathing crystalline silica can cause lung disease, including silicosis and lung cancer.

SECTION 3 — COMPOSITION/INFORMATION ON INGREDIENTS

Substances	CAS Number	Percent	ACGIH TLV-TWA	OSHA PEL-TWA*
Crystalline Silica, quartz	14808-60-7	1 – 6%	0.025 mg/m^3	$\frac{10\ mg/m^3}{\%SiO2 + 2}$

*More restrictive exposure limits may be enforced by some states, agencies, or other authorities.
Non-hazardous components > 94%

SECTION 4 — FIRST AID MEASURES

Inhalation:	If inhaled, remove to a dust free area. Get medical attention if respiratory irritation develops or if breathing becomes difficult. Inhalation may aggravate existing respiratory illness.
Skin:	Wash with soap and water until clear. Seek medical attention if irritation persists.
Eyes:	In case of contact, immediately flush eyes with plenty of water for at least 15 minutes and get medical attention if irritation persists.
Ingestion:	No adverse effects.
Notes to Physician:	Treat Symptomatically.

SECTION 5 — FIRE FIGHTING MEASURES

Flash Point/Range (F):	Not applicable
Flash Point/Range (C):	Not applicable
Flash Point Method:	Not applicable
Autoignition Temperature (F):	Not applicable
Autoignition Temperature (C):	Not applicable
Flammability Limits in Air – Lower (%):	Not applicable
Flammability Limits in Air – Upper (%):	Not applicable
Fire Extinguishing Media:	All standard firefighting media. (Caution slippery when wet.)
Special Exposure Hazards:	Not applicable
Special Protective Equipment for Firefighters:	Not applicable
NFPA Ratings:	Health 0, Flammability 0, Reactivity 0

SECTION 6 — ACCIDENTAL RELEASE MEASURES

Personal Precautionary Measures:	Use appropriate protective equipment. Avoid creating and breathing dust.
Environmental Precautionary Measures:	None known.
Procedure for Cleaning/Absorption:	Collect using appropriate dustless method and hold for appropriate disposal.

SECTION 7 — HANDLING AND STORAGE

Handling Precautions:	This product contains quartz which may become airborne. Avoid breathing dust. Avoid creating dusty conditions. Use only with adequate ventilation to keep exposure below recommended exposure limits. Wear a NIOSH/MSHA European Standard En 149, or equivalent certified for silica bearing dust, respirator when using this product. Material is slippery when wet. Promptly clean up spills to avoid breathing airborne dust.
Storage Information:	Use good housekeeping in storage and work areas to prevent accumulation of dust. Close container when not in use. Do not reuse empty container.

SECTION 8 — EXPOSURE CONTROLS/PERSONAL PROTECTION

Engineering Controls:	Use approved industrial ventilation and local exhaust as required to maintain exposures below applicable exposure limits.
Personal Protective Equipment:	If engineering controls and work practices cannot prevent excessive exposures, the selection and proper use of personal protective equipment should be determined by an industrial hygienist or other qualified professional based on the specific application of this product.
Respiratory Protection:	Not normally needed. If significant exposures are possible use NIOSH/MSH respirator approved for silica bearing dust.
Hand Protection:	Normal work gloves.
Skin Protection:	Wear clothing appropriate for the work environment. Dusty clothing should be laundered before reuse. Use precautionary measures to avoid creating dust when removing or laundering clothing.
Eye Protection:	Wear safety glasses or goggles to protect against exposure.
Other Precautions:	None known.

SECTION 9 — PHYSICAL AND CHEMICAL PROPERTIES

Physical State:	Solid
Color:	Light tan to gray as dry powder
Odor:	Odorless
pH:	8 – 10 (5% aqueous solution)
Specific Gravity @ 20 C (Water=1):	2.45 – 2.55
Density @ 20 C (lbs/gallon):	Not determined
Bulk Density @ 20 C (lbs/ft^3):	60 – 66
Boiling Point/Range (F):	Not applicable
Boiling Point/Range (C):	Not applicable
Freezing Point/Range (F):	Not applicable
Freezing Point/Range (C):	Not applicable
Vapor Pressure @ 20 C (mmHg):	Not applicable
Vapor Density (Air=1):	Not applicable
Percent Volatiles:	Not applicable
Evaporation Rate (Butyl Acetate=1):	Not applicable
Solubility in Water (g/100ml):	Insoluble, forms colloidal suspension
Solubility in Solvents (g/100ml):	Not applicable
VOCs (lbs/gallon):	Not applicable
Viscosity, Dynamic @ 20 C (centipoise):	240
Viscosity, Kinematic @ 20 C (centistrokes):	Not applicable
Partition Coefficient/n-Octanol/Water:	Not applicable
Molecular Weight (g/mole):	Not applicable

SECTION 10 — STABILITY AND REACTIVITY

Stability Data:	Stable
Hazardous Polymerization:	Will Not Occur
Conditions to Avoid:	None anticipated
Incompatibility (Materials to Avoid):	Hydrofluoric Acid
Hazardous Decomposition Products:	None
Additional Guidelines:	Not applicable

SECTION 11 — TOXICOLOGICAL INFORMATION

Principle Route of Exposure:	Eye or skin contact, inhalation.
Inhalation:	Inhaled crystalline silica in the form or quartz from occupational sources is carcinogenic to humans (IARC, Group 1).
Skin Contact:	May cause mechanical skin irritation.
Eye Contact:	May cause eye irritation.
Ingestion:	None known
Aggravated Medical Conditions:	Individuals with respiratory disease, including but not limited to asthma and bronchitis, or subject to eye irritation, should not be exposed to respirable quartz-bearing dust.
Chronic Effects/Carcinogenicity:	Silicosis: Excessive inhalation of respirable crystalline silica dust may cause a progressive, disabling, and sometimes-fatal lung disease called silicosis. Symptoms include cough, shortness of breath, wheezing, non-specific chest illness, and reduced pulmonary function. This disease is exacerbated by smoking. Individuals with silicosis are predisposed to develop tuberculosis. Cancer Status: The International Agency for Research on Cancer (IARC, 1997) concludes that there is sufficient evidence in humans for carcinogenicity of inhaled crystalline silica from occupational sources (IARC Group 1), that carcinogenicity was not detected in all industrial circumstances studied and that carcinogenicity may depend on characteristics of the crystalline silica or on external factors affecting its biological activity. See IARC Monograph 68, Silica, Some Silicates and Organic Fibres (June 1997). The National Toxicology Program (NTP) classifies respirable crystalline silica as "Known to be a human carcinogen" (NTP 9th Report on Carcinogens, 2000). The American Conference of Governmental Industrial Hygienists (ACGIH) classifies crystalline silica, quartz, as a suspected human carcinogen (A2).
Other Information:	See "Adverse Effects of Crystalline Silica Exposure" published by the American Thoracic Society Medical Section of the American Lung Association, American Journal of Respiratory and Critical Care Medicine, Volume 155, pages 761-768 (1997).
Toxicity Tests	
Oral Toxicity:	Not determined (on FDA GRAS list; used as a food additive)
Dermal Toxicity:	Not determined (on FDA GRAS list; used in cosmetic preparations)
Inhalation Toxicity:	Not determined
Primary Irritation Effect:	Not determined
Carcinogenicity:	Refer to IARC Monograph 68, Silica, Some Silicates and Organic Fibres (June 1997).
Genotoxicity:	Not determined
Reproductive/Developmental Toxicity:	Not determined

SECTION 12 — ECOLOGICAL INFORMATION

Mobility (Water/Soil/Air):	Not determined
Persistence/Degradability:	Not determined
Bio-accumulation:	Not determined

Ecotoxicological Information

Acute Fish Toxicity:	Not determined
Acute Crustaceans Toxicity:	Not determined
Acute Algae Toxicity:	Not determined

Chemical Fate Information:	Not determined
Other Information:	Not applicable

SECTION 13 — DISPOSAL CONSIDERATIONS

Disposal Method:	Bury in a licensed landfill according to federal, state and local regulations.
Contaminated Packaging:	Follow all applicable national or local regulations.

SECTION 14 — TRANSPORT INFORMATION

Land Transportation

DOT – Not Restricted
Canadian TDG – Not Restricted
ADR – Not Restricted

Air Transportation

ICAO/IATA – Not Restricted

Sea Transportation

IMDG – Not Restricted

Other Transportation Information

Labels: None

SECTION 15 — REGULATORY INFORMATION

US Regulations

US TSCA Inventory	All components listed on inventory or are exempt.
EPA SARA Title III Extremely Hazardous Substances	Not applicable
EPA SARA (311, 312) Hazard Class	Acute Health Hazard Chronic Health Hazard
EPA SARA (313) Chemicals	This product does not contain a toxic chemical for routine annual “Toxic Chemical Release Reporting” under Section 313 (40 CFR 372).

EPA CERCLA/Superfund Reportable Spill Quantity	Not applicable
EPA RCRA Hazardous Waste Classification	If product becomes a waste, it does NOT meet the criteria of a hazardous waste as defined by the US EPA.
California Proposition 65	This product contains crystalline silica (respirable) which is a substance known to the State of California to cause cancer.

Canadian Regulations

Canadian DSL Inventory	All components listed on inventory are exempt.
WHMIS Hazard Class	This product contains crystalline silica (respirable) and is classified as a Class D, Division 2, Subdivision A substance.

SECTION 16 — OTHER INFORMATION

Prepared	03/18/2015
Last Revision	07/23/2015

DISCLAIMER

All information presented herein is believed to be accurate; however, it is the user's responsibility to determine in advance of need that the information is current and suitable for their circumstances. No warranty or guarantee, expressed or implied is made by WYO-BEN, INC. as to this information, or as to the safety, toxicity or effect of the use of this product.

POTENTIAL ADDITIVIVE

CLAY CUTTER

© Copyright, Michels Directional Crossings, a Division of Michels Corporation, 2020

MATERIAL SAFETY DATA SHEET

1. Product and Company Identification

Material name CLAY CUTTER™

Version # 05

Revision date 19-December-2008

Chemical name Formation Inhibitor

Chemical description Liquid

CAS # Mixture

Manufacturer

CETCO
Drilling Products Group
2870 Forbs Avenue
Hoffman Estates, IL 60192 US
safetydata@amcol.com
http://www.cetco.com/
General Information (800) 527-9948
CHEMTREC® (800) 424-9300

2. Hazards Identification

Emergency overview No hazards resulting from the material as supplied. Health injuries are not known or expected under normal use.

OSHA regulatory status While this material is not considered hazardous by the OSHA Hazard Communication Standard (29 CFR 1910.1200), this MSDS contains valuable information critical to the safe handling and proper use of the product. This MSDS should be retained and available for employees and other users of this product.

Potential health effects

Eyes Contact with eyes may cause irritation.

Skin May cause skin irritation in susceptible persons.

Inhalation Health injuries are not known or expected under normal use.

Ingestion Ingestion of this product may cause nausea, vomiting and diarrhea.

3. Composition / Information on Ingredients

The manufacturer lists no ingredients as hazardous according to OSHA 29 CFR 1910.1200.

Composition comments This product is not considered to be a carcinogen by IARC, ACGIH, NTP, or OSHA.

4. First Aid Measures

First aid procedures

Eye contact Immediately flush eyes with plenty of water for at least 15 minutes. Get medical attention if irritation develops or persists.

Skin contact Wash off with soap and water. Remove contaminated clothing. Get medical attention if irritation develops or persists.

Inhalation Remove to fresh air. If the affected person is not breathing, apply artificial respiration. If breathing is difficult, give oxygen. Get medical attention, if needed.

Ingestion Give victim water or milk. If swallowed, do NOT induce vomiting. Never give anything by mouth to an unconscious person. Obtain medical attention.

General advice If you feel unwell, seek medical advice (show the label where possible).

5. Fire Fighting Measures

Flammable properties Not a fire hazard.

Extinguishing media

Suitable extinguishing media Use any media suitable for the surrounding fires.

Protection of firefighters

Protective equipment and precautions for firefighters	Move containers from fire area if you can do it without risk. Cool containers with flooding quantities of water until well after fire is out.
Hazardous combustion products	None known.

6. Accidental Release Measures

Environmental precautions	Prevent spreading over a wide area (e.g. by containment or oil barriers). Prevent further leakage or spillage if safe to do so. Do not flush into surface water or sanitary sewer system.
Methods for containment	Stop the flow of material, if this is without risk. Dike the spilled material, where this is possible.
Methods for cleaning up	Absorb spill with inert material (e.g., dry sand or earth), then place in a chemical waste container. Do not allow the spilled product to enter public drainage system or open water courses. Wear appropriate protective equipment and clothing during clean-up.

7. Handling and Storage

Handling	Use only in well-ventilated areas. Provide sufficient air exchange and/or exhaust in work rooms. In case of insufficient ventilation, wear suitable respiratory equipment.
Storage	Keep containers tightly closed in a dry, cool and well-ventilated place. Store in original container.

8. Exposure Controls / Personal Protection

Engineering controls	Good general ventilation should be sufficient to control airborne levels. Local exhaust is suggested for use, where possible, in enclosed or confined spaces. Facilities storing or utilizing this material should be equipped with an eyewash facility and a safety shower.

Personal protective equipment

Eye / face protection	Wear safety glasses; chemical goggles (if splashing is possible).
Skin protection	Wear appropriate chemical resistant gloves. Use of an impervious apron is recommended.
Respiratory protection	None required where adequate ventilation conditions exist.
General hygeine considerations	Use good industrial hygiene practices in handling this material. Wash hands before breaks and immediately after handling the product.

9. Physical & Chemical Properties

Appearance	Not available.
Color	Not available.
Odor	Not available.
Odor threshold	Not available.
Physical state	Liquid.
Form	Liquid.
pH	Not available.
Melting point	Not available.
Freezing point	Not available.
Boiling point	Not available.
Flash point	Not available.
Evaporation rate	Not available.
Flammability	Not available.
Flammability limits in air, upper, % by volume	Not available.
Flammability limits in air, lower, % by volume	Not available.
Vapor pressure	Not available.
Vapor density	Not Determined
Specific gravity	Not available.
Relative density	Not available.
Solubility (water)	Not available.

Partition coefficient (n-octanol/water)	Not available.
Auto-ignition temperature	Not available.
Decomposition temperature	Not available.
Percent volatile	50 % v/v

10. Chemical Stability & Reactivity Information

Chemical stability	No hazards to be especially mentioned. Stable at normal conditions.
Conditions to avoid	None known.
Incompatible materials	None known.
Hazardous decomposition products	Upon decomposition, this product may yield gaseous nitrogen oxides, carbon monoxide, carbon dioxide and/or low molecular weight hydrocarbons.
Possibility of hazardous reactions	Will not occur.

11. Toxicological Information

Component analysis - LD50	This product is judged to have an acute oral LD50 (rat) greater than 5 g/kg of body weight, and ar acute dermal LD50 (rabbit) greater than 3.16 g/kg of body weight.
Further information	This product has no known adverse effect on human health.

12. Ecological Information

Ecotoxicity	This material is not expected to be harmful to aquatic life. This material has a biodegradatior percentage of 85.2% and is considered to have ready biodegradability. This material exceeds the OECD Guideline 301B for environmental friendliness
Environmental effects	Ecological injuries are not known or expected under normal use.
Persistence and degradability	Not available.

13. Disposal Considerations

Disposal instructions	Dispose in accordance with all applicable regulations.

14. Transport Information

DOT

Not regulated as dangerous goods.

IATA

Not regulated as dangerous goods.

IMDG

Not regulated as dangerous goods.

15. Regulatory Information

US federal regulations	OSHA Process Safety Standard: This material is not known to be hazardous by the OSHA Highly Hazardous Process Safety Standard, 29 CFR 1910.119.

CERCLA (Superfund) reportable quantity

None

Superfund Amendments and Reauthorization Act of 1986 (SARA)

Hazard categories	Immediate Hazard - No Delayed Hazard - No Fire Hazard - No Pressure Hazard - No Reactivity Hazard - No
Section 302 extremely hazardous substance	No
Section 311 hazardous chemical	No

Inventory status

Country(s) or region	Inventory name	On inventory (yes/no)*
Australia	Australian Inventory of Chemical Substances (AICS)	No

Country(s) or region	Inventory name	On inventory (yes/no)*
Canada	Domestic Substances List (DSL)	No
Canada	Non-Domestic Substances List (NDSL)	No
China	Inventory of Existing Chemical Substances in China (IECSC)	No
Europe	European Inventory of New and Existing Chemicals (EINECS)	No
Europe	European List of Notified Chemical Substances (ELINCS)	No
Japan	Inventory of Existing and New Chemical Substances (ENCS)	No
Korea	Existing Chemicals List (ECL)	No
New Zealand	New Zealand Inventory	No
Philippines	Philippine Inventory of Chemicals and Chemical Substances (PICCS)	No
United States & Puerto Rico	Toxic Substances Control Act (TSCA) Inventory	No

A "Yes" indicates that all components of this product comply with the inventory requirements administered by the governing country(s)

State regulations This product does not contain a chemical known to the State of California to cause cancer, birth defects or other reproductive harm.

16. Other Information

Further information This safety datasheet only contains information relating to safety and does not replace any product information or product specification.

HMIS ratings

NFPA ratings Health: 0
Flammability: 0
Instability: 0

Disclaimer The information provided in this Safety Data Sheet is correct to the best of our knowledge, information and belief at the date of its publication. The manufacturer expressly does not make any representations, warranties, or guarantees as to its accuracy, reliability or completeness nor assumes any liability, for its use. It is the user's responsibility to verify the suitability and completeness of such information for each particular use.

Third party materials: Insofar as materials not manufactured or supplied by this manufacturer are used in conjunction with, or instead of this product, it is the responsibility of the customer to obtain, from the manufacturer or supplier, all technical data and other properties relating to these and other materials and to obtain all necessary information relating to them. No liability can be accepted in respect of the use of this product in conjunction with materials from another supplier.

MICHELS®

POTENTIAL ADDITIVIVE

CLAY BREAKER

© Copyright, Michels Directional Crossings, a Division of Michels Corporation, 2020

1. CHEMICAL PRODUCT AND COMPANY IDENTIFICATION

TRADE NAME: ClayBreaker

24-HOUR EMERGENCY TELEPHONE: 1-800-535-5053 (Infotrac)

SUPPLIER: DCS Fluids Solutions LP
P.O. Box 1027
Graham, TX 76450
(940) 521-0400

Product Use: Well Stimulation Additive, Clay Stabilizer
CAS #: Mixture

2. COMPOSITION, INFORMATION ON INGREDIENTS

No hazardous ingredients as defined by OSHA 29 CFR 1910.1200

3. HAZARD IDENTIFICATION

EMERGENCY OVERVIEW: Colorless to amber liquid with a strong odor. May be irritating to eyes, skin and respiratory tract. May be harmful if swallowed. Avoid contact with skin, eyes and clothing.

POTENTIAL HEALTH HAZARDS:

- **INHALATION:** May cause irritation of respiratory tract.
- **INGESTION:** May cause irritation of the gastrointestinal tract including nausea, vomiting and diarrhea.
- **SKIN:** May cause skin irritation.
- **EYES:** May cause eye irritation.

CHRONIC EFFECTS: None known

Ingredients found on one of the OSHA designated carcinogen lists are listed below.

No ingredients listed in this section.

4. FIRST AID MEASURES

INHALATION: If breathing is difficult, remove to fresh air and keep at rest in a comfortable position for breathing. Obtain immediate medical attention.

INGESTION: If swallowed, seek immediate medical attention and show this container or label. Do not induce vomiting without medical advice.

SKIN: Wash skin thoroughly with soap and water. Remove contaminated clothing. Get medical attention if any irritation continues.

EYES: Immediately flush eyes with large quantities of water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of all eye and lid tissue. Get medical attention if irritation develops.

ADVICE TO PHYSICIANS: No specific treatment. Treat according to symptoms present.

5. FIRE FIGHTING MEASURES

FLASH POINT: >200° F (>93.3° C)
FLAMMABLE LIMITS: LEL: N/A
UEL: N/A

EXTINGUISHING AGENTS:

Water, dry chemical, CO2, water spray or regular foam.
Do not use a solid water stream as it may scatter and spread fire.

SPECIAL FIRE FIGHTING PROCEDURES:

Wear positive-pressure, self-contained breathing apparatus (SCBA) and protective fire fighting clothing (including fire fighting helmet, coat, pants, boots, and gloves). If protective equipment is not available or not used, fight fire from a protected location or safe distance.

UNUSUAL FIRE & EXPLOSION HAZARDS:

Always stay away from tanks engulfed in flame. Withdraw immediately in case of rising sound from venting safety devices of any discoloration of tanks due to fire. Move containers from fire area if you can do it without risk. Do not scatter spilled material with high pressure water streams. Use water spray to cool unopened containers. Cool containers with flooding quantities of water until well after fire is out.

6. ACCIDENTAL RELEASE MEASURE

PERSONAL PROTECTION:

Don appropriate personal protective equipment prior to entering spill/leak area.
(See Section 8)

SPILL CLEAN-UP PROCEDURES:

Limit access to area, as necessary. Shut off leak if it can be done safely. Contain spill with dike. Prevent run-off into sewers or waterways. Pump large spills into salvage containers. Soak up residue and small spills with vermiculite, paper, clay or other absorbent material. Remove affected soils. Place in salvage containers. Continue to observe handling precautions.

WASTE DISPOSAL METHOD:

Follow approved local beneficial reuse guidelines for uncontaminated spent drilling fluids. If contaminated, dispose of in a licensed industrial landfill according to local, state and federal regulations. If released to the environment for other than its intended purpose, this product, in its current state, does not meet the definition of a hazardous waste under 40 CFR 261.

7. HANDLING AND STORAGE

HANDLING PRECAUTIONS:

Always wear recommended personal protection equipment. Do not get in eyes, on skin or clothing. Avoid breathing mist or vapor. Use only with adequate ventilation or wear respiratory protection.

STORAGE PRECAUTIONS:

Keep containers tightly closed and properly labeled. Store at moderate temperatures in dry, well-ventilated area. Keep container closed when not in use. Keep in original container. Store containers in upright position. Since emptied containers retain product residue, follow hazard precautions even when empty.

HYGIENIC WORK PRACTICES:

Use good personal hygiene practices. Wash hands and skin thoroughly after handling. Promptly remove contaminated clothing and wash before reuse. Emergency eye wash fountains and safety showers should be available in the immediate vicinity of any potential exposure.

8. EXPOSURE CONTROLS AND PERSONAL PROTECTION

ENGINEERING CONTROLS:

There are no occupational exposure limits established at this time. Since this material may be irritating to skin and mucous membranes, general room ventilation plus local exhaust at points of emission should be used to maintain levels of airborne contaminants as low as feasibly possible.

PERSONAL PROTECTION EQUIPMENT

RESPIRATORY:

Respiratory protection is not required under normal use. Wear a NIOSH/MSHA approved respirator following manufacturer's recommendations where airborne contaminants may occur.

EYE / FACE PROTECTION:

Wear chemical safety goggles or face shield to protect against splashing.

SKIN PROTECTION:

Chemical resistant gloves and splash aprons made of impermeable material should be worn.

9. PHYSICAL AND CHEMICAL PROPERTIES

- **Appearance and Odor:** Colorless to amber liquid with strong odor.
- **Physical State:** Liquid
- **pH:** 6.5 – 9
- **Vapor Pressure:** Not determined
- **Vapor Density:** Not determined
- **Boiling Point:** Not determined
- **Melting Point:** 469.4° F estimated
- **Solubility in Water:** Complete
- **Specific Gravity:** 1.01 – 1.03

10. STABILITY AND REACTIVITY

CHEMICAL STABILITY: Stable at normal conditions**.**

CONDITIONS TO AVOID: Heat, flames and sparks.

MATERIALS TO AVOID: Strong acids.

HAZARDOUS DECOMPOSITION PRODUCTS: None expected.

HAZARDOUS POLYMERIZATION: Does not occur.

11. TOXICOLOGICAL INFORMATION

ACUTE EFFECTS:

Acute LD50: 400 – 4000 mg/kg, Rat, Oral
Acute LC50: > 4000 mg/kg, Rat, Dermal

Not expected to be hazardous by OSHA criteria.

CHRONIC EFFECTS:

None known. Not expected to be hazardous by OSHA criteria.
This product has no known adverse effect on human health.

12. ECOLOGICAL INFORMATION

ENVIRONMENTAL INFORMATION:

ClayBreaker has a biodegradation percentage of 85.2% and is considered to have ready biodegradability. Test of ready biodegradability are stringent tests that provide limited opportunity for acclimation and biodegradation to occur. A positive result in a test of ready biodegradability is an indication that the test substance will undergo rapid and ultimate biodegradation in the environment. OECD Guideline 301B has set the standard for ready biodegradability at 60%. ClayBreaker exceeds this standard for environmental friendliness.

13. DISPOSAL CONSIDERATIONS

Follow approved local beneficial reuse guidelines for uncontaminated spent drilling fluids. If contaminated, dispose of in a licensed industrial landfill according to local, state and federal regulations. If released to the environment for other than its intended purpose, this product does not meet, in its present state, the definition of a hazardous waste under 40 CFR 261. Under RCRA, it is the responsibility of the user of the product to determine, at the time of disposal, whether the product meets RCRA criteria for a hazardous waste. Dispose in accordance with all applicable regulations.

14. TRANSPORTATION INFORMATION

U.S. DEPARTMENT OF TRANSPORTATION (DOT):

Not regulated as dangerous goods.

CANADIAN TRANSPORTATION OF DANGEROUS GOODS (TDG):

Not regulated as dangerous goods.

IMDG:

Not regulated as dangerous goods.

IATA:

Not regulated as dangerous goods.

15. REGULATORY INFORMATION

OSHA: This product is not a "Hazardous Chemical" as defined by the OSHA Hazard Communication Standard, 29 CFR 1910.1200. We request that you make all information in the Material Safety Data Sheet available to your employees.

TSCA: Not on inventory.

SARA TITLE III/CERCLA:

To aid our customers in complying with regulatory requirements, SARA Title III Hazard Categories for this product are indicated below. If the word "YES" appears next to any category, this product may be reportable by you under the requirements of 40 CFR Part 370. Please consult those regulations for details.

Immediate (Acute) Health:	YES
Delayed (Chronic) Health:	NO
Fire Hazard:	NO
Reactive Hazard:	NO
Sudden Release of Pressure:	NO

Reportable Quantity: Not reportable

Spills/release resulting in the loss of any ingredient at or above its RQ requires immediate notification to the National Response Center (1-800-424-8802) and to your Local Emergency Planning Committee.

16. OTHER INFORMATION

HMIS RATINGS: HEALTH (1) FLAMMABILITY (0) PHYSICAL HAZARD (0)
Based on the NPCA HMIS III rating system.

CURRENT ISSUE DATE: August 1, 2014
Updated information on LD50 and LC50.

DCS Fluid Solutions LP believes the information contained in this material safety data sheet is accurate based on the information supplied by reputable suppliers of our raw materials. We cannot make any assertions as to its reliability or completeness; therefore, the user may rely on it only at user's risk. We have made no effort to censor or conceal deleterious aspects of this product. Since we cannot anticipate or control the conditions under which this information and product may be used, we make no guarantee that the precautions we have suggested will be adequate for all individuals and/or situations. It is the obligation of each user of this product to comply with the requirements of all applicable laws regarding use and disposal of this product. Neither warranty, either expressed or implied, nor liability of any nature with respect to this product or to the data herein is made or incurred hereunder.

MATERIAL SAFETY DATA SHEET

5/04/04

1. PRODUCT AND COMPANY IDENTIFICATION

Product Name: TorqBreaker™
Chemical Family: Surfactant
Supplier: DCS Fluid Solutions.
PO Box1027
Graham TX 76450
940-521-0500

2. COMPOSITION/INFORMATION ON INGREDIENTS

OSHA Regulated Components: None

3. HAZARDS IDENTIFICATION

Acute Health Effects: None
Chronic Health Effects: None
Carcinogen: No

PRIMARY ENTRY ROUTES:

1) Skin and Eyes: Repeated contact with the skin may be irritating. Eye contact may be irritating.
2) Ingestion: May be harmful.
3) Inhalation: Not considered a hazard.

4. FIRST AID MEASURES

SKIN CONTACT:	Remove contaminated clothing without delay. Wash skin thoroughly with water. If irritation persists, get medical attention.
EYE CONTACT:	Rinse thoroughly with plenty of water for 15 minutes. In case of persistent eye irritation, consult a physician.
INGESTION:	Give large volumes of water. Do not induce vomiting. Get medical attention.
INHALATION:	N/A

5. FIRE FIGHTING MEASURES

FLASH POINT: None (will not burn)
EXTINGUISHING MEDIA: N/A
FIRE FIGHTING PROCEDURES: N/A

UNUSUAL FIRE AND EXPLOSION HAZARD: Fire fighters should observe all precautions that apply to any fire where chemicals are stored.

6. ACCIDENTAL RELEASE MEASURES

If product leaks or spills, flood area with water. Mop up and dispose to sanitary sewer. Adhere to all Federal, State and Local Regulations.

7. HANDLING AND STORAGE

Store containers tightly closed and in an upright position.
Do not destroy or deface the label.

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

Food, beverages and tobacco products should not be carried, stored or consumed where this material is in use. Before eating, drinking or smoking, wash face and hands with soap and water. Avoid skin contact. Protective clothing such as impervious gloves are recommended to prevent skin contact. For operations where eye or face contact can occur, wear eye protection such as chemical splash proof goggles or face shield.

9. PHYSICAL AND CHEMICAL PROPERTIES

Physical State:	Viscous Liquid
Color:	Red
Odor:	Slight Citrus
Solubility:	Completely soluble in water
Specific Gravity:	1.035
pH	10.0
Freezing Point:	N/A
Flash Point:	None (will not burn)
Vapor Pressure	N/A

10. STABILITY AND REACTIVITY

STABILITY: Stable Conditions to Avoid: None known
POLYMERIZATION: Will not occur. Conditions to Avoid: None known

11. TOXICOLOGICAL INFORMATION

None Available

12. ECOLOGICAL INFORMATION

None Available

13. DISPOSAL INFORMATION

If released into the environment for other than its intended purpose, this product does not meet the definition of a hazardous waste under 40 CFR 261. Follow approved local beneficial reuse guidelines for uncontaminated spent drilling fluids. If contaminated, dispose of in a licensed industrial landfill according to local, state and federal regulations..Recover and reuse if possible.

14. TRANSPORT INFORMATION

SHIPPING NAME: Not applicable/Not Regulated
HAZARD CLASS: Not applicable
UN NUMBER: Not applicable
DOT HAZARDOUS SUBSTANCES: Not applicable
TRANSPORT LABEL: None Required

15. REGULATORY INFORMATION

US TSCA: All components of this product are included on the TSCA Inventory in compliance with the Toxic Substances Control Act, 15 U.S.C. 2601

SECTION 313 SUPPLIER NOTIFICATION (SARA): This product contains the following toxic chemicals subject to the reporting requirements of Section 313 of the Emergency Planning and Community Right to Know Act of 1986 and of 40 CFR 372: None.

16. OTHER INFORMATION – NFPA Hazard Rating

Fire
0
Health 0 0 Reactivity
2
PPE

Health: 0=minimal
1=slightly hazardous
2=hazardous

BHS Marketing

Western Briquette

BALLBUSTER

MATERIAL SAFETY DATA SHEET

Sodium Acid Pyrophosphate

Date: June 20, 2001

I Company Identification

Company Name:	BHS Marketing / Western Briquette
Mailing Address:	P.O. Box 27955 SLC, UT 84127-0955
Physical Address:	2320 West Indiana Ave. SLC, UT 84104
Telephone:	(801) 973-8232
Fax:	(801) 973-8838
Emergency Number:	Chemtrec (800) 424-9300

II Product Identification

Product Name:	Sodium Acid Pyrophosphate, SAPP, Disodium pyrophosphate
Chemical Formula:	$Na_2H_2P_2O_7$
Molecular Weight:	221.96
CAS Number:	7758-16-9

III Typical Physical Properties

Physical Appearance:	White powder
Odor:	Odorless
Bulk Density:	0.9 kg/l approx.
pH (1% aqueous solution):	3.7-4.4
Melting Point:	Decomposes at 220°C
Solubility in Water:	approx. 13g in 100g water, room temperature
Vapor Pressure:	Negligible

IV Reactivity Data

Chemical Stability:	Stable
Materials to Avoid:	Avoid contact with strong bases

V Toxicological Information

Toxicity:	Oral-rat LD-50: > 1000 mg/kg

VI Hazard Data

Acute	
Eye Contact:	Causes irritation
Skin Contact:	Causes irritation
Ingestion:	Causes irritation
Inhalation:	Causes irritation
Symptoms of Overexposure:	Irritant to eyes, skin and respiratory systems. Ingestion can cause vomiting and diarrhea

VII Recommended First Aid Measures

General First Aid:	Remove the person from source of exposure. Wash with plenty of water. Upon ingestion, if the person is conscious, cause him/her to vomit. Get medical attention

VIII Fire Fighting Measures

Flash Point:	Not flammable
Extinguishing Media:	Not combustible
Special Firefighting Procedures:	Protective clothing and self contained breathing apparatus

IX Accidental Release Measures

Clean up & Disposal of Spills:	Spillage or leakages are cleaned up by mechanical removal, if possible. Flushing with plenty of water

X Handling & Storage

Handling:	Avoid inhalation, contact with eyes, skin or clothing. Do not ingest
Storage:	Store in a cool, well ventilated, dry place, in tightly closed containers

XI Exposure Controls/ Personal Protection

Appropriate Hygienic Practices:	As part of good industrial, personal hygiene and safety procedure, avoid all unnecessary exposure to the product and ensure prompt removal from eyes, skin and clothing. Maintain good housekeeping to control dust accumulations.

Personal Protection Equipment

Eye Protection:	Use safety glasses
Skin Protection:	Wear protective clothing, gloves and dust respirator if necessary
Ventilation Protection:	Adequate ventilation

XII Additional Information

The information in this MSDS was obtained from sources, which we believe are reliable. However, the information is provided without any warranty, expressed or implied, regarding its correctness.

The conditions or methods of handling, storage, use and disposal are beyond our control and may be beyond our knowledge. For this and other reasons, we do not assume responsibility and expressly disclaim liability for loss, damage, or expense arising out of or in any way connected with handling, storage, use or disposal of the product.

Soda Ash / Sodium Carbonate

Revision Date: 1/18/2016

SAFETY DATA SHEET

1 PRODUCT AND COMPANY IDENTIFICATION

1.1 PRODUCT IDENTIFIERS

Product Name:	Soda Ash or Sodium Carbonate
Chemical Name:	Sodium Carbonate
Synonyms / Common Names:	Carbonic Acid Sodium Salt
Registration Number REACH:	01-2119485498-19-0011
Product Type REACH:	Substance/mono-constituent
CAS Number:	497-19-8
EC Index Number:	011-005-00-2
EC Number:	207-838-8
RTECS Number:	VZ4050000

1.2 RELEVANT IDENTIFIED USES

Glass production	Paper production	Manufacture of substances
Detergent component	Laboratory chemicals	Acidity regulator

1.3 MANUFACTURER

Ciner Wyoming LLC
254 County Road 4-6
Green River, Wyoming 82935
United States
Telephone Number: (307) 875-2600
www.ciner.us.com

1.4 EMERGENCY TELEPHONE NUMBER

Emergency Response Information Provider: CHEMTREC

Within the United States Emergency Telephone Number: 1-800-424-9300

Outside the United States / International Emergency Telephone Number: +1-703-527-3887

2 HAZARD(S) IDENTIFICATION

2.1 CLASSIFICATION OF THE SUBSTANCE OR MIXTURE

GHS Classification in accordance with 29 CFR 1910 (OSHA HazCom Standard):

Eye Irritation (Category 2A), H319

For the full text of the H-Statements mentioned in this Section, see Section 16.

2.2 GHS LABEL ELEMENTS, INCLUDING PRECAUTIONARY STATEMENTS

Pictograms:

Irritant

Signal Word: Warning

Hazard Statement(s):

H319 Causes serious eye irritation.

Precautionary Statement(s):

P264 Wash skin thoroughly after handling.

P280 Wear eye protection / face protection.

P305 + P351 + P338 IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing.

P337 + P313 If eye irritation persists: Get medical advice / attention.

2.3 HAZARDS NOT OTHERWISE CLASSIFIED OR NOT COVERED BY GHS

None

3 COMPOSITION / INFORMATION ON INGREDIENTS

3.1 SUBSTANCES

Synonyms:	Soda Ash, Sodium Carbonate, Carbonic Acid Sodium Salt
Formula:	Na_2CO_3

Molecular Weight: 105.99 g/mol

Component (REACH Registration)	CAS # / EC #	Concentration	Classifications	Remark
Sodium carbonate (01-2119485498-19-0011)	CAS #: 497-19-8 EC #: 207-838-8	≥ 99%	Eye Irrit. 2A, H319	Mono-constituent

* For the full text of the H-Statements mentioned in this Section, see Section 16.

4 FIRST-AID MEASURES

4.1 DESCRIPTION OF FIRST-AID MEASURES

General - Check the vital functions. Unconscious: maintain adequate airway and respiration. Respiratory arrest: artificial respiration or oxygen. Cardiac arrest: perform resuscitation. Victim conscious with labored breathing: half-seated. Victim in shock: on his back with legs slightly raised. Vomiting: prevent asphyxia/aspiration pneumonia. Prevent cooling by covering the victim (no warming up). Keep watching the victim. Give psychological aid. Keep the victim calm, avoid physical strain. Depending on the victim's condition: doctor/hospital.

After inhalation - Remove the victim into fresh air. Respiratory problems: consult a doctor/medical service.

After skin contact - Rinse with water. Soap may be used. Do not apply (chemical) neutralizing agents. Take victim to a doctor if irritation persists.

After eye contact - Rinse immediately with plenty of water for at least 15 minutes. Do not apply neutralizing agents. Take victim to an ophthalmologist if irritation persists.

After ingestion - Rinse mouth with water. Immediately after ingestion: give lots of water to drink. Do not induce vomiting. Consult a doctor/medical service if victim is unwell.

4.2 MOST IMPORTANT SYMPTOMS AND EFFECTS, BOTH ACUTE AND DELAYED

4.2.1 Acute Symptoms

If inhaled - Dry/sore throat. Coughing. Slight irritation. Exposure to high concentrations: Irritation of the respiratory tract. Irritation of the nasal mucous membranes. Respiratory difficulties.

In case of skin contact - Not irritating

In case of eye contact - Inflammation/damage of the eye tissue. Corrosion of the eye tissue. Lacrimation.

If swallowed – After absorption of high quantities: Nausea. Vomiting. Abdominal pain. Irritation of the gastric/intestinal mucosa.

4.2.2 Delayed Symptoms

No effects known.

4.3 INDICATION OF ANY IMMEDIATE MEDICAL ATTENTION AND SPECIAL TREATMENT NEEDED

No data available.

5 Fire-Fighting Measures

5.1 Extinguishing Media

Use water spray, alcohol-resistant foam, dry chemical or carbon dioxide.

5.2 Special hazards arising from the substance or mixture

Upon combustion CO and CO2 are formed. Reacts on exposure to water with some metals. CO2 generation occurs when mixed with acidic materials.

5.3 Advice for firefighters

Wear self-contained breathing apparatus for firefighting if necessary.

5.4 Special protective equipment for firefighters

Gloves. Safety glasses. Protective clothing. Dust cloud protection and heat/fire exposure: Compressed air respirator.

6 Accidental Release Measures

6.1 Personal Precautions, Protective Equipment and Emergency Procedures

Use personal protective equipment. Avoid dust formation. Avoid breathing vapors, mist or gas. Ensure adequate ventilation. Evacuate personnel to safe areas. Avoid breathing dust. For personal protection see section 8.

6.2 Environmental precautions

Contain released substance, pump into suitable containers. Plug the leak, cut off the supply. Knock down/dilute dust cloud with water spray. Violent exothermic reaction with some acids; release of harmful gases/vapors (carbon dioxide). Carbon dioxide is heavier than air and will collect in ducts, drains and low lying areas. Prevent spreading in sewers.

6.3 Methods and material for containment and cleaning up

Prevent dust cloud formation. Scoop solid spill material into closed containers. Carefully collect the spill. Clean contaminated surfaces with an excess of water. Wash clothing and equipment after handling.

6.4 Reference to other sections

For disposal see section 13.

7 HANDLING AND STORAGE

7.1 PRECAUTIONS FOR SAFE HANDLING

Avoid contact with skin and eyes. Use air conveying/mechanical systems for bulk transfer to storage. Provide appropriate exhaust ventilation at places where dust is formed. In case of insufficient ventilation, wear suitable respiratory equipment if release of airborne dust is expected.

7.2 CONDITIONS FOR SAFE STORAGE, INCLUDING ANY INCOMPATIBILITIES

Store in original container. Keep in properly labeled containers. Keep container tightly closed.

7.3 SUITABLE PACKAGING MATERIAL

No data available

7.4 INCOMPATIBLE PRODUCTS

Aluminum, powdered aluminum, and acids.

8 EXPOSURE CONTROLS / PERSONAL PROTECTION

8.1 COMPONENTS WITH WORKPLACE CONTROL PARAMETERS

Contains no substances with occupational exposure limit values.

8.2 EXPOSURE CONTROLS

Appropriate engineering controls – Avoid formation of dust. Keep away from ignition sources. Keep container tightly closed. Handle in accordance with good industrial hygiene and safety practice. Wash hands before breaks and at the end of workday.

8.3 PERSONAL PROTECTIVE EQUIPMENT

Eye / Face Protection - Safety glasses with side shields or protective goggles. Use equipment for eye protection tested and approved under appropriate government standards such as NIOSH (US) or EN 166(EU).

Skin protection - Handle with gloves, butyl rubber or PVC, which have good resistance. Gloves must be inspected prior to use. Use proper glove removal technique to avoid skin contact with product. Dispose of contaminated gloves after use in accordance with applicable laws and good laboratory practices. Wash and dry hands.

Body Protection – Protective clothing. The type of protective equipment must be selected according to the concentration and amount of the dangerous substance at the specific workplace.

Respiratory protection – For nuisance exposures use type P95 (US) or type P1 (EU EN 143) particle respirator. For higher level protection use type OV/AG/P99 (US) or type ABEK-P2 (EU EN 143) respirator cartridges. Use respirators and components tested and approved under appropriate government standards such as NIOSH (US) or CEN (EU).

8.4 CONTROL OF ENVIRONMENTAL EXPOSURE

Prevent leakage or spillage if safe to do so. Do not let product enter drains. See section 6.2, 6.3, and 13.

9 PHYSICAL AND CHEMICAL PROPERTIES

9.1 INFORMATION ON BASIC PHYSICAL AND CHEMICAL PROPERTIES

Appearance Form:	Crystalline Solid / Crystalline Powder / Grains / Lumps
Color:	Colorless
Odor:	Odorless
Odor Threshold:	No data available
Particle Size:	694 µm
pH:	11.6; 5.0%
Melting Point / Freezing Point:	851 °C / 1,564 °F
Boiling Point	1,600 °C / 2,912 °F
Flash Point:	No data available
Explosion Limits:	No data available
Evaporation Rate:	No data available
Flammability:	Non Combustible
Log Kow:	-6.19 Estimated value
Viscosity:	No data available
Vapor Pressure:	No data available
Vapor Density:	No data available
Solubility water:	212.5 g/l; 20 °C / 68 °F
Relative Density:	2.52 -253; 20 °C / 68 °F
Absolute Density:	2,530 kg/m^3
Decomposition temperature:	>1600 °C / >2912 °F
Auto-ignition temperature:	>400 °C / >752 °F
Explosive Properties:	No data available
Oxidizing Properties:	No data available

9.2 PHYSICAL HAZARDS

No data available

10 STABILITY AND REACTIVITY

10.1 REACTIVITY

None under normal use conditions.

10.2 CHEMICAL STABILITY

Stable. Decomposes by reaction with strong acid.

10.3 POSSIBILITY OF HAZARDOUS REACTIONS

None under normal processing.

10.4 CONDITIONS TO AVOID

Exposure to air or moisture over prolonged periods.

10.5 INCOMPATIBLE MATERIALS

Aluminum, powdered aluminum, and acids.

10.6 HAZARDOUS POLYMERIZATION

Hazardous polymerization does not occur.

---

11 TOXICOLOGICAL INFORMATION

11.1 INFORMATION ON TOXICOLOGICAL EFFECTS

11.1.1 Acute toxicity

LD50 Oral - rat – 2,800 mg/kg
LD50 Dermal – rabbit >2,000 mg/kg
LD50 Inhalation - rat – 2.30 mg/l, 2 hour exposure time

11.1.2 Corrosion / irritation

Skin - rabbit
Result: Mild skin irritation – 24 hours

11.1.3 Serious eye damage / eye irritation

Eyes - rabbit
Result: Severe eye irritation – 24 hours

11.1.4 Respiratory or skin sensitization

Inhalation - no data available
Skin Sensitization: no data available

11.1.5 Germ cell mutagenicity

No data available

11.1.6 Carcinogenicity

No data available

11.1.7 Reproductive toxicity

No data available

11.1.8 Specific target organ toxicity - single exposure

No data available

11.1.9 Specific target organ toxicity - repeated exposure

No data available

11.1.10 Chronic effects from short and long-term exposure

On continuous / repeated exposure / contact: Red skin. Dry skin. Tingling / irritation of the skin. Affection of the nasal septum.

12 ECOLOGICAL INFORMATION

12.1 TOXICITY

	Parameter	Method	Value	Duration	Species	Test design	Fresh / salt water	Value determination
Acute toxicity fishes	LC50	Other	300 mg/l	96 h	Lepomis macrohirus	Static system	Fresh water	Experimental value
Acute toxicity invertebrates	EC50	Other	200 - 227 mg/l	48 h	Ceriodaphnia sp.	Semi-static	Fresh water	Experimental value
Toxicity algae and other aquatic plants	EC50		242 mg/l	5 days	Algae			Experimental value

12.2 PERSISTENCE AND DEGRADABILITY:

Biodegradability: not applicable

12.3 BIOACCUMULATIVE POTENTIAL:

Low potential for bioaccumulation (Log Know <4)

12.4 MOBILITY IN SOIL:

Low potential for absorption in soil.

12.5 RESULTS OF PBT AND VPVB ASSESSMENT:

PBT/vPvB assessment not available as chemical safety assessment is not required/not conducted.

12.6 OTHER ADVERSE EFFECTS:

No data available

13 DISPOSAL CONSIDERATIONS

13.1 WASTE DISPOSAL

Remove waste in accordance with local and/or national regulations. Contact a licensed professional waste disposal service to dispose of this material. Different types of hazardous waste should not be mixed together if it will entail a risk of pollution or create problems for the further management of the waste. Hazardous waste shall be managed responsibly. Do not discharge into drains.

14 TRANSPORT INFORMATION

14.1 UNITED STATES DEPARTMENT OF TRANSPORTATION (DOT)
Non-regulated

14.2 INTERNATIONAL MARITIME DANGEROUS GOODS (IMDG)
Non-regulated

14.3 INTERNATIONAL AIR TRANSPORT ASSOCIATION (IATA)
Non-regulated

14.4 TDG / ADN / RID / ADR
Non-regulated

15 REGULATORY INFORMATION

15.1 SARA 302 COMPONENTS
SARA 302: No chemicals in this material are subject to the reporting requirements of SARA Title III, Section 302.

15.2 SARA 313 COMPONENTS
SARA 313: This material does not contain any chemical with known CAS numbers that exceed the threshold (De Minimis) reporting levels established by SARA Title III, Section 313.

15.3 SARA 311/312 HAZARDS
Acute Health Hazard

15.4 PENNSYLVANIA RIGHT TO KNOW COMPONENTS
Sodium carbonate, CAS-No: 497-19-8

15.5 NEW JERSEY RIGHT TO KNOW COMPONENTS
Sodium carbonate, CAS-No: 497-19-8

15.6 WHMIS CLASSIFICATION: C, D2
Note: The product listed on this SDS has been classified in accordance with the hazard criteria of the Canadian Controlled Products Regulations.

16 OTHER INFORMATION

16.1 FULL TEXT OF H-STATEMENTS REFERRED TO UNDER SECTION 2 AND 3.

Eye Irrit.	Eye Irritation
H319	Causes serious eye irritation

16.2 HMIS RATING

Health Hazard:	2
Flammability:	0
Physical Hazard:	0

16.3 NFPA RATING

Health Hazard:	2
Fire Hazard:	0
Reactivity Hazard:	0

4 FIRST-AID MEASURES

4.1 DESCRIPTION OF FIRST-AID MEASURES

General - Check the vital functions. Unconscious: maintain adequate airway and respiration. Respiratory arrest: artificial respiration or oxygen. Cardiac arrest: perform resuscitation. Victim conscious with labored breathing: half-seated. Victim in shock: on his back with legs slightly raised. Vomiting: prevent asphyxia/aspiration pneumonia. Prevent cooling by covering the victim (no warming up). Keep watching the victim. Give psychological aid. Keep the victim calm, avoid physical strain. Depending on the victim's condition: doctor/hospital.

After inhalation - Remove the victim into fresh air. Respiratory problems: consult a doctor/medical service.

After skin contact - Rinse with water. Soap may be used. Do not apply (chemical) neutralizing agents. Take victim to a doctor if irritation persists.

After eye contact - Rinse immediately with plenty of water for at least 15 minutes. Do not apply neutralizing agents. Take victim to an ophthalmologist if irritation persists.

After ingestion - Rinse mouth with water. Immediately after ingestion: give lots of water to drink. Do not induce vomiting. Consult a doctor/medical service if victim is unwell.

4.2 MOST IMPORTANT SYMPTOMS AND EFFECTS, BOTH ACUTE AND DELAYED

4.2.1 Acute Symptoms

If inhaled - Dry/sore throat. Coughing. Slight irritation. Exposure to high concentrations: Irritation of the respiratory tract. Irritation of the nasal mucous membranes. Respiratory difficulties.

In case of skin contact - Not irritating

In case of eye contact - Inflammation/damage of the eye tissue. Corrosion of the eye tissue. Lacrimation.
If swallowed – After absorption of high quantities: Nausea. Vomiting. Abdominal pain. Irritation of the gastric/intestinal mucosa.

4.2.2 Delayed Symptoms

No effects known.

4.3 INDICATION OF ANY IMMEDIATE MEDICAL ATTENTION AND SPECIAL TREATMENT NEEDED

No data available.

5 FIRE-FIGHTING MEASURES

5.1 EXTINGUISHING MEDIA

Use water spray, alcohol-resistant foam, dry chemical or carbon dioxide.

5.2 SPECIAL HAZARDS ARISING FROM THE SUBSTANCE OR MIXTURE

Upon combustion CO and CO2 are formed. Reacts on exposure to water with some metals. CO2 generation occurs when mixed with acidic materials.

5.3 ADVICE FOR FIREFIGHTERS

Wear self-contained breathing apparatus for firefighting if necessary.

5.4 SPECIAL PROTECTIVE EQUIPMENT FOR FIREFIGHTERS

Gloves. Safety glasses. Protective clothing. Dust cloud protection and heat/fire exposure: Compressed air respirator.

6 ACCIDENTAL RELEASE MEASURES

6.1 PERSONAL PRECAUTIONS, PROTECTIVE EQUIPMENT AND EMERGENCY PROCEDURES

Use personal protective equipment. Avoid dust formation. Avoid breathing vapors, mist or gas. Ensure adequate ventilation. Evacuate personnel to safe areas. Avoid breathing dust. For personal protection see section 8.

6.2 ENVIRONMENTAL PRECAUTIONS

Contain released substance, pump into suitable containers. Plug the leak, cut off the supply. Knock down/dilute dust cloud with water spray. Violent exothermic reaction with some acids; release of harmful gases/vapors (carbon dioxide). Carbon dioxide is heavier than air and will collect in ducts, drains and low-lying areas. Prevent spreading in sewers.

6.3 METHODS AND MATERIAL FOR CONTAINMENT AND CLEANING UP

Prevent dust cloud formation. Scoop solid spill material into closed containers. Carefully collect the spill. Clean contaminated surfaces with an excess of water. Wash clothing and equipment after handling.

6.4 REFERENCE TO OTHER SECTIONS

For disposal see section 13.

7 HANDLING AND STORAGE

7.1 PRECAUTIONS FOR SAFE HANDLING

Avoid contact with skin and eyes. Use air conveying/mechanical systems for bulk transfer to storage. Provide appropriate exhaust ventilation at places where dust is formed. In case of insufficient ventilation, wear suitable respiratory equipment if release of airborne dust is expected.

7.2 CONDITIONS FOR SAFE STORAGE, INCLUDING ANY INCOMPATIBILITIES

Store in original container. Keep in properly labeled containers. Keep container tightly closed.

7.3. SUITABLE PACKAGING MATERIAL

No data available.

7.4 INCOMPATIBLE PRODUCTS

Aluminum, powdered aluminum, and acids.

8 EXPOSURE CONTROLS / PERSONAL PROTECTION

8.1 COMPONENTS WITH WORKPLACE CONTROL PARAMETERS

Contains no substances with occupational exposure limit values.

8.2 EXPOSURE CONTROLS

Appropriate engineering controls – Avoid formation of dust. Keep away from ignition sources. Keep container tightly closed. Handle in accordance with good industrial hygiene and safety practice. Wash hands before breaks and at the end of workday.

8.3 PERSONAL PROTECTIVE EQUIPMENT

Eye / Face Protection - Safety glasses with side shields or protective goggles. Use equipment for eye protection tested and approved under appropriate government standards such as NIOSH (US) or EN 166(EU).

Skin Protection - Handle with gloves, butyl rubber or PVC, which have good resistance. Gloves must be inspected prior to use. Use proper glove removal technique to avoid skin contact with product. Dispose of contaminated gloves after use in accordance with applicable laws and good laboratory practices. Wash and dry hands.

Body Protection – Protective clothing. The type of protective equipment must be selected according to the concentration and amount of the dangerous substance at the specific workplace.

Respiratory Protection – For nuisance exposures use type P95 (US) or type P1 (EU EN 143) particle respirator. For higher level protection use type OV/AG/P99 (US) or type ABEK-P2 (EU EN 143) respirator cartridges. Use respirators and components tested and approved under appropriate government standards such as NIOSH (US) or CEN (EU).

8.4 CONTROL OF ENVIRONMENTAL EXPOSURE

Prevent leakage or spillage if safe to do so. Do not let product enter drains. See section 6.2, 6.3, and 13.

9 PHYSICAL AND CHEMICAL PROPERTIES

9.1 INFORMATION ON BASIC PHYSICAL AND CHEMICAL PROPERTIES

Appearance Form:	Crystalline Solid / Crystalline Powder / Grains / Lumps
Color:	Colorless
Odor:	Odorless
Odor Threshold:	No data available
Particle Size:	694 µm
pH:	11.6; 5.0%
Melting Point / Freezing Point:	851°C / 1,564°F
Boiling Point:	1,600°C / 2,912°F
Flash Point:	No data available
Explosion Limits:	No data available
Evaporation Rate:	No data available
Flammability:	Non-Combustible
Log Kow:	-6.19 Estimated Value
Viscosity:	No data available
Vapor Pressure:	No data available
Vapor Density:	No data available
Solubility Water:	212.5 g/l; 20°C / 68°F
Relative Density:	2.52 – 2.53; 20°C / 68°F
Absolute Density:	2,530 kg/m^3
Decomposition Temperature:	>1600°C / >2912°F
Auto-Ignition Temperature:	>400°C / >752°F
Explosive Properties:	No data available
Oxidizing Properties:	No data available

9.2 PHYSICAL HAZARDS
No data available.

10 STABILITY AND REACTIVITY

10.1 REACTIVITY
None under normal use conditions.

10.2 CHEMICAL STABILITY
Stable. Decomposes by reaction with strong acid.

10.3 POSSIBILITY OF HAZARDOUS REACTIONS
None under normal processing.

10.4 CONDITIONS TO AVOID
Exposure to air or moisture over prolonged periods.

10.5 INCOMPATIBLE MATERIALS
Aluminum, powdered aluminum, and acids.

10.6 HAZARDOUS POLYMERIZATION
Hazardous polymerization does not occur.

11 TOXICOLOGICAL INFORMATION

11.1 INFORMATION ON TOXICOLOGICAL EFFECTS

11.1.1 Acute toxicity
LD50 Oral - rat – 2,800 mg/kg
LD50 Dermal - rabbit >2,000 mg/kg
LD50 Inhalation - rat – 2.30 mg/l, 2-hour exposure time

11.1.2 Corrosion/irritation
Skin - rabbit
Result: Mild skin irritation – 24 hours

11.1.3 Serious eye damage/eye irritation
Eyes - rabbit
Result: Severe eye irritation – 24 hours

11.1.4 Respiratory or skin sensitization
Inhalation - no data available
Skin Sensitization: no data available

11.1.5 Germ cell mutagenicity
No data available

11.1.6 Carcinogenicity
No data available

11.1.7 Reproductive toxicity
No data available

11.1.8 Specific target organ toxicity - single exposure
No data available

11.1.9 Specific target organ toxicity - repeated exposure
No data available

11.1.10 Chronic effects from short and long-term exposure
On continuous / repeated exposure / contact: Red skin. Dry skin. Tingling / irritation of the skin. Affection of the nasal septum.

12 ECOLOGOCAL INFORMATION

12.1 TOXICITY

	Parameter	Method	Value	Duration	Species	Test Design	Fresh/Salt Water	Value Determination
Acute toxicity fishes	LC50 Other	Other	300 mg/l	96 h	Lepomis macronhirus	Static system	Fresh water	Experimental value
Acute toxicity invertebrates	EC50	Other	200-227 mg/l	48 h	Ceriodaphnia sp.	Semi-static	Fresh water	Experimental value
Toxicity algae and other aquatic plants	EC50		242 mg/l	5 days	Algae			Experimental value

12.2 PERSISTENCE AND DEGRADABILITY:
Biodegradability: not applicable

12.3 BIOACCUMULATIVE POTENTIAL:
Low potential for bioaccumulation (Log Kow <4)

12.4 MOBILITY IN SOIL:
Low potential for absorption in soil.

12.5 RESULTS OF PBT AND VPVB ASSESSMENT:
PBT/vPvB assessment not available as chemical safety assessment is not required/not conducted.

12.6 OTHER ADVERSE EFFECTS:
No data available.

13 DISPOSAL CONSIDERATIONS

13.1 WASTE DISPOSAL
Remove waste in accordance with local and/or national regulations. Contact a licensed professional waste disposal service to dispose of this material. Different types of hazardous waste should not be mixed together if it will entail a risk of pollution or create problems for the further management of the waste. Hazardous waste shall be managed responsibly. Do not discharge into drains.

14 TRANSPORT INFORMATION

14.1 UNITED STATES DEPARTMENT OF TRANSPORTATION (DOT)
Non-regulated

14.2 INTERNATIONAL MARITIME DANGEROUS GOODS (IMDG)
Non-regulated

14.3 INTERNATIONAL AIR TRANSPORT ASSOCIATION (IATA)
Non-regulated

14.4 TDG/ADN/RID/ADR
Non-regulated

15 REGULATORY INFORMATION

15.1 SARA 302 COMPONENTS
SARA 302: No chemicals in this material are subject to the reporting requirements of SARA Title III, Section 302.

15.2 SARA 313 COMPONENTS
SARA 313: This material does not contain any chemical with known CAS numbers that exceed the threshold (De Minimis) reporting levels established by SARA Title III, Section 313.

15.3 SARA 311/312 HAZARDS
Acute Health Hazard

15.4 PENNSYLVANIA RIGHT TO KNOW COMPONENTS
Sodium carbonate, CAS-No: 497-19-8

15.5 NEW JERSEY RIGHT TO KNOW COMPONENTS
Sodium carbonate, CAS-No: 497-19-8

15.6 WHMIS CLASSIFICATION: C, D2
Note: The product listed on this SDS has been classified in accordance with the hazard criteria of the Canadian Controlled Products Regulations.

15.7 US CALIFORNIA SAFE DRINKING WATER & TOXIC ENFORCEMENT ACT (PROPOSITION 65)
This product does not contain any chemicals known to the State of California to cause cancer, birth, or any other reproductive defects.

16 OTHER INFORMATION

16.1 FULL TEXT OF H-STATEMENTS REFERRED TO UNDER SECTION 2 AND 3.

Eye Irrit.	Eye Irritation
H319	Causes serious eye irritation

16.2 HMIS RATING

Health Hazard:	2
Flammability:	0
Physical Hazard:	0

16.3 NFPA RATING

Health Hazard:	2
Fire Hazard:	0
Reactivity Hazard:	0

16.4 NOTICE

The above information is believed to be correct but is not intended to be all inclusive and shall be used only as a guide. The information in this document is based on the present state of our knowledge and is applicable to the product with regard to appropriate safety precautions. It does not represent any guarantee of the properties of the product. Ciner and its Affiliates shall not be held liable for any damage resulting from handling or from contact with the above product.

16.5 PRODUCT CERTIFICATIONS

This product is certified to NSF/ANSI Standard 60 for use in drinking water treatment at the specified maximum use limit. The MUL (maximum use level) for sodium carbonate anhydrous is 100 mg/L under NSF/ANSI Standard 60.

Chemtrec - (800) 424-9300

Safety Data Sheet

CITRIC ACID FCC/USP PWD

SECTION 1:IDENTIFICATION OF THE SUBSTANCE/ MIXTURE AND OF THE COMPANY/UNDERTAKING

1.1 PRODUCT IDENTIFIER

- Chemical name	Citric acid - Food grade
- REACH Registration Number	01-2119457026-42-0031

1.2 RELEVANT IDENTIFIED USES OF THE SUBSTANCE AND USES ADVISED AGAINST

Citric acid can be used in food as food additives and also in technical application as clarifying agent, water softener, buffer, foam booster and stabilizer, complexing agent and as an intermediate in production of organic chemicals.

1.3 DETAILS OF THE SUPPLIER

- Company identification

US:

CHEMTREC
Toll-Free: 1-800-424-9300 (USA and Canada)
Non Toll-Free +1-703-527-3887 (Global)

SECTION 2:HAZARDS IDENTIFICATION

2.1. CLASSIFICATION OF THE SUBSTANCE OR MIXTURE

According with the version of the Globally Harmonized system of Classification and labeling adopted in the United states and Regulation 1272/2008/EC [CLP]: Eyes irritant category 2(H319)

Safety Data Sheet

CITRIC ACID FCC/USP PWD

2.2 LABEL ELEMENTS

GHS07

Signal word:
Warning

Hazard Statement:
Causes serious eye irritation. H319

Precautionary Statement:
Wash hands thoroughly after handling. P264
Wear eye protection. P280

Precautionary Statement. IF IN EYES: P305
Response :
Rinse cautiously with water for several minutes. P351
Remove contact lenses, if present and easy to do Continue rinsing. P338
If eye irritation persists: P337
Get medical advice/attention. P313

2.3. OTHER HAZARDS
FIRE AND EXPLOSION HAZARD:
May form combustible dust concentrations in air. Possibility of dust explosion. it is recommended that all dust control equipment and material transport systems involved are engineered to prevent conditions contributing to dust explosions. Do not allow dust to accumulate on flat surfaces, on rafters or building structural components. Keep away from all ignition sources including heat, sparks and flame.

SECTION 3:COMPOSITION/INFORMATION OF INGREDIENTS

- Chemical name Citric acid - Food grade

Safety Data Sheet

CITRIC ACID FCC/USP PWD

- CAS number	77-92-9
- EINECS number	201-069-1
- Synonyms	2 - Hydroxy -1,2,3 propanetricarboxylic acid Acidulant - Citric acid - food additive E330.

SECTION 4:FIRST AID MEASURES

4.1 DESCRIPTION OF FIRST AID MEASURES

- General advise	Seek medical attention if irritation develops after first aid application
- Inhalation	Move people from the exposure to fresh air.
- Skin contact	Wash skin with soap and water.
- Eye contact	Remove particulates by irrigating with eye wash solution or clean water, holding eyelids apart.
- Ingestion	Wash mouth and flush throat upto the stomach.

4.2 MOST IMPORTANT SYMPTOMS AND EFFECTS, BOTH ACUTE AND DELAYED
ROUTE(S) OF ENTRY: Skin Contact; Eye Contact
HUMAN EFFECTS AND SYMPTOMS OF OVEREXPOSURE:
ACUTE SKIN CONTACT: This product is irritating to the skin resulting in reddening, stinging, and swelling.
ACUTE EYE CONTACT: This product is irritating to the eyes resulting in stinging, reddening, tearing, and swelling.
CHRONIC EFFECTS OF EXPOSURE: No applicable information was found concerning any adverse chronic health effects from overexposure to this product.
CARCINOGENICITY: The components of this product are not listed by NTP, IARC or regulated as a carcinogen by OSHA.
MEDICAL CONDITIONS
AGGRAVATED BY EXPOSURE: Persons with pre-existing eye or skin disorders may be more susceptible to the effects of this product.

4.3 INDICATION OF ANY IMMEDIATE MEDICAL ATTENTION AND SPECIAL TREATMENT NEEDED.
None Anticipated

SECTION 5: FIRE-FIGHTING MEASURES

5.1 EXTINGUISHING MEDIA
Water spray, dry powder, carbon dioxide or media appropriate for surrounding fire. Use of water jet may cause explosive dust conditions.

Safety Data Sheet

CITRIC ACID FCC/USP PWD

5.2 SPECIFIC HAZARDS
FIRE AND EXPLOSION HAZARD: Possibility of dust explosion. It is recommended that all dust control equipment and material transport systems involved are engineered to prevent conditions contributing to dust explosions. Do not allow dust to accumulate on flat surfaces, on rafters or building structural components. Use of water jet may cause explosive dust conditions.
SEE NFPA 61, Standard for the prevention of Fire and Dust Explosions in Agricultural and Food Processing Facilities, 2008 or later Edition, and other related standards.

5.3 SPECIFIC PROTECTIVE EQUIPMENT AND PRECAUTIONS FOR FIRE-FIGHTERS
Wear self-contained breathing apparatus and full protective gear. Use water spray to cool fire exposed containers.

FLAMMABILITY CLASS (OSHA)
Not applicable

HAZARDOUS COMBUSTION PRODUCTS
Carbon dioxide and carbon monoxide

SECTION 6:ACCIDENTAL RELEASE MEASURES

6.1 PERSONAL PRECAUTIONS
Use personal protective equipment. Wear eye protection. Avoid contact with skin and eyes.

6.2 ENVIRONMENTAL PRECAUTIONS
Prevent further leakage or spillage if safe to do so. No special environmental precautions required

6.3 METHODS FOR CLEANING UP
Vacuum or sweep spills. Minimize dust generation.
If washing down spilled area is necessary, use copious amounts of water and control runoff.
Follow local, state and federal regulations for product disposal

6.4 REFERENCE TO OTHER SECTIONS
See Section 7 for information on safe handling
See Section 8 for information on personal protection equipment
See Section 13 for disposal information

SECTION 7: HANDLING AND STORAGE

Safety Data Sheet

CITRIC ACID FCC/USP PWD

7.1 PRECAUTIONS FOR SAFE HANDLING
See NFPA 61, Standard for the Prevention of Fire and Dust Explosions in Agricultural and Food Processing Facilities, 2008 Edition, and other related standards. Use with adequate ventilation. Minimize dust generation and accumulation; dust deposits should not be allowed to accumulate on surfaces, as these may form an explosive mixture if they are disturbed.

All dust control equipment and material transport systems involved are engineered to prevent conditions contributing to dust explosions and may require explosion relief vents or an explosion suppression system or an oxygen-deficient environment. Bonding and grounding systems may be required.

Dust-handling systems (such as exhaust ducts, dust collectors, vessels, and processing equipment) should be designed to limit or prevent leakage of dust into the work area.

Do not allow dust to accumulate on flat surfaces, on rafters or building structural components. Routine housekeeping should be instituted to reduce dust accumulation. Use Avoid dispersal of dust in the air; use vacuum or wet sweeping methods. Do not use compressed air to clean surfaces.

Keep away from all ignition sources including heat, sparks, and flame. Where dust accumulations occur use non-sparking tools.

7.2 CONDITIONS OF SAFE STORAGE, INCLUDING ANY INCOMPATIBILITIES
Store in a cool dry place. Store in a tightly closed container/bag.
The packaging material should have reasonable moisture and air barriers and comply with food regulations.
7.3 SPECIFIC END USE(S)
See overview of the exposure scenario and summary of risk management measures in Appendix 1

SECTION 8: EXPOSURE CONTROLS / PERSONAL PROTECTION

8.1 CONTROL PARAMETERS
Exposure limits: Nuisance dust (also called particulate not otherwise regulated (PNOR)).
OSHA PEL: 15 mg/ mg/m3 Total dust
5 mg/m3 Respirable dust
ACGIH TLV: 10 mg/m3 Inhalable dust
5 mg/m3 Respirable dust
15 mg/m3 Total dust

Safety Data Sheet

CITRIC ACID FCC/USP PWD

8.2 EXPOSURE CONTROLS
APPROPRIATE ENGINEERING CONTROLS:
Ventilation: See NFPA 61, Standard for the Prevention of Fire and Dust Explosions in Agricultural and Food Processing Facilities, 2008 Edition, and National Fire Protection Association 650, Standard for Pneumatic Conveying Systems for Handling Combustible Materials, 1997 Edition and other related standards. Normal industrial hygiene measures should be sufficient for protection of employees from exposure to dusts. Local and mechanical exhaust is desirable when dumping bags.

APPROPRIATE PERSONAL PROTECTIVE EQUIPMENT:
Eye protection: Safety glasses are recommended. Safety goggles are desirable when dumping bags.
Emergency wash facilities: Eye wash is recommended for conditions where dust generation is likely.
Special protective clothing: Not normally required.
Gloves: Not normally required. Use ordinary work gloves if dust dries skin.
Respirator: NIOSH approved N-95 dust respirator if working in situations that could generate large amounts of airborne dust.

FOR FIREFIGHTING AND OTHER IMMEDIATELY DANGEROUS TO LIFE OR HEALTH CONDITIONS:
See section 5.

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

9.1 INFORMATION ON BASIC PHYSICAL AND CHEMICAL PROPERTIES

- Physical form	Solid
- Color	White to off-white
- Odor	Essentially odorless to very slight sugar odor
- pH (concentration)	NA
- Boiling point	104°C (219 °F)
- Flash point	345°C
- Melting/freezing point	approx. 153°C at 1,013 hPa
- Decomposition temperature	NA
- Auto-ignition temperature	NA
- Explosion properties	NA
- Oxidising properties	NA
- Vapour pressure	2.21*10-6 Pa at 25°C
- Vapor density	0.62 (Air = 1)
- Relative density	1.665at 20°C

Safety Data Sheet

CITRIC ACID FCC/USP PWD

- Bulk density	Not Established
- Specific gravity	15 °C (1.24 at 59 °F)
- Viscosity	Not Established
- Water solubility	590 g/L at 20°C
- Solubility (non aqueous)	Methyl alcohol: completely miscible
- Partition coefficient	In OCTANOL/ WATER (log value): Log Kow: -0.2 to -1.8
- Dissociation constant	pKa: 3.13, 4.76 and 6.4 at 25°
- Evaporation rate	Less than 1 (Butyl acetate =1)

9.2 OTHER INFORMATION

SECTION 10: STABILITY AND REACTIVITY

10.1 REACTIVITY
Stable

10.2 CHEMICAL STABILITY
Stable under normal conditions.
Polymerization will not occur.

10.3 POSSIBILITY OF HAZARDOUS REACTIONS
Not applicable

10.4 CONDITIONS TO AVOID
Practices which produce dust or disperse finely divided dust in air.
See NFPA 61. Standard for the Prevention of Fire and Dust Explosions in Agricultural and Food Processing Facilities, 2008 Edition, and other related standards.

10.5 INCOMPATIBLE MATERIALS
Oxidizing agents, strong acids

10.6 Hazardous decomposition products:
Nothing unusual

SECTION 11: TOXICOLOGICAL INFORMATION

11.1 INFORMATION ON TOXICOLOGICAL EFFECTS

- Inhalation	ORAL: LD50: 5400 – 5790 mg/kg bw (mouse) / LD50: 11700 mg/kg bw (rat) DERMAL: LD50 >2000 mg/kg bw rat
- Ingestion	No effects known or anticipated.

Safety Data Sheet

CITRIC ACID FCC/USP PWD

- Skin irritation / corrosion	Sustained exposure in a dusty manufacturing environment may result in mechanical irritation in the creases of the skin, particularly at the fingers, or other drying effects. no health effects known or anticipated.
- Eye irritation	Irritating to eyes.
- Skin sensitisation	Not sensitizing
- Chronic toxicity	Not known or anticipated
- Genetic toxicity	Not known or anticipated
- Carcinogenicity	Not classifiable as Carcinogen.
- Reprotoxicity	Not known or anticipated
- Specific effects	Not applicable

SECTION 12: ECOLOGICAL INFORMATION

12.1 TOXICITY
LC50 for freshwater fish: 440 mg/l
EC50/LC50 for freshwater invertebrates: 1535 mg/l.

12.2 PERSISTENCE/DEGRADABILITY
Ready biodegradable

12.3 BIOACCUMULATIVE POTENTIAL
Log Kow <3, not bioaccumulative

12.4 MOBILITY IN SOIL
Not applicable

12.5 BPT, vPvB
The substance does not meet the criteria for PBT or vPvB.

12.6 OTHER ADVERSE EFFECTS
None known

SECTION 13: DISPOSAL CONSIDERATIONS

13.1 WASTE TREATMENT METHODS
Follow local, state and federal regulations for product disposal. Not a hazardous waste unless contaminated with hazardous products.

SECTION 14: TRANSPORTATION INFORMATION

Safety Data Sheet

CITRIC ACID FCC/USP PWD

International regulations (RID/ADR; RTMDR; IMDG; IATA/OACI): Not classified as dangerous for transport.
DOT shipping label: Non-hazardous

SECTION 15: REGULATORY INFORMATION

15.1 SAFETY, HEALTH AND ENVIRONMENTAL REGULATIONS
According with the version of the Globally Harmonized System of Classification and labeling adopted in the United States and Regulation 1272/2008/EC(CLP): Classified

15.2 CHEMICAL SAFETY ASSESSMENT
US FEDERAL REGULATIONS:
Clean Air Act:
ODS: Not applicable.
SARA (EPCRA) Section 313 (40 C.F.R. § 372.65): Not applicable.
TSCA Status: On TSCA inventory.

STATE REPORTING REQUIREMENTS:
California Proposition 65: Not applicable.

SECTION 16: OTHER INFORMATION

See Hazard Communication Guidance for Combustible Dusts, OSHA 3371-08 2009, U.S. Occupational Safety and Health Administration, https://www.osha.gov/Publications/3371combustible-dust.html (accessed 10/8/14)
And
NFPA 654, Standard for the Prevention of Fire and Dust Explosions from the Manufacturing, Processing, and Handling of Combustible Particulate Solids, for general safe handling and design guidance.

Other classifications of the substance:
TSCA STATUS: On TSCA Inventory.
FDA STATUS: Citrus acid, Anhydrous complies with FDA Regulation 21 C.F.R. § 184.1033;
CALIFORNIA PROPOSITION 65: Not applicable.
HMIS rating:
Health: 1
Flammable: 0

Safety Data Sheet

CITRIC ACID FCC/USP PWD

Reactivity: 0
(0 = minimal ; 1 = slight ; 2 = moderate ; 3 = serious ; 4 = severe)

Safety Data Sheet according to Commission Regulation (EU) No 453/2010 of 20 May 2010 amending Regulation (EC) No 1907/2006 of the European Parliament and of the Council on the Registration, Evaluation, Authorization and Restriction of Chemicals (REACH)

DISCLAIMER OF LIABILITY

The information in this SDS is collected from reliable sources. However, the information is provided without any warranty, expressed or implied. The conditions or methods of handling, storage, use or disposal of the product might be beyond our control and knowledge. For the avoidance of doubt, we shall in no such circumstances be under any liability in respect of loss, damage or expenses arising from handling, storage, use or disposal of the product by your company and/or your subcontractors. This SDS is only applicable for the product mentioned in the identification chapter and title. If the product is used as a component in another product, this SDS may not be applicable on the composite material.

Annex I

SUMMARY OF RISK MANAGEMENT MEASURES
Safe use has been demonstrated by calculation of risk characterisation ratios where appropriate, while qualitative considerations were stipulated where quantification was not possible. The risk characterisation is based on the following risk management measures:
Exposure scenario ,,Description ,,General measures ,,Specific Human Health risk management measures ,,Specific Environment risk management measures ,,
ES1 ,,Production and intermediate use on production sites ,,Good working practices, containment and safe handling in line with industry best practice. ,,(i) Local Exhaust ventilation (LEV)
(ii) Personal Protective Equipment (PPE): Working clothing, protective gloves and safety glasses. Dust masks in areas where dust may be present. In case of open handling of larger quantities or accidental release, a particle mask or respirator with independent air supply is recommended. ,,(i) Treatment of effluent in waste water treatment plant. ,,
ES2, 3, 4, 5, 6, 7, 8, 9, 11, 12, 13, 14, 15, 16, 17 ,,Industrial use ,,
Good working practices, containment and safe handling in line with industry best practice. ,,(i) Local Exhaust ventilation (LEV) if
aerosol mists or dusts are present.
(ii) Personal Protective Equipment (PPE): Working clothing, protective gloves and safety glasses. Dust masks in areas where dust may be present. In case of open handling of larger quantities or accidental release, a particle mask or respirator with independent air supply is

Safety Data Sheet

CITRIC ACID FCC/USP PWD

recommended. ,,(i) Treatment of effluent in waste water treatment plant. ,,
ES10 ,,Textile industry ,,Good working practices, containment and safe handling in line with industry best practice. ,,(i) Local Exhaust ventilation (LEV) if aerosol mists or dusts are present.
(ii) Personal Protective Equipment (PPE): Working clothing, ,,(i) Treatment of effluent in waste water treatment plant.
(ii) No direct discharge into the marine environment ,,

Subject: RE: WBI Tioga Modeling files

Morning Dan,

I'm finishing up on the modeling project that was in the queue before WBI's and would anticipate starting on the WBI modeling review sometime next week. I can't give you a good estimate of how long the review will take, but if I have any questions I'll reach out to you.

Rheanna Kautzman

Rheanna –

I just wanted to stay in touch.
If able, please let me know if the WBI Tioga project has entered active review.

Much thanks.

CAUTION: This email originated from an outside source. Do not click links or open attachments unless you know they are safe.

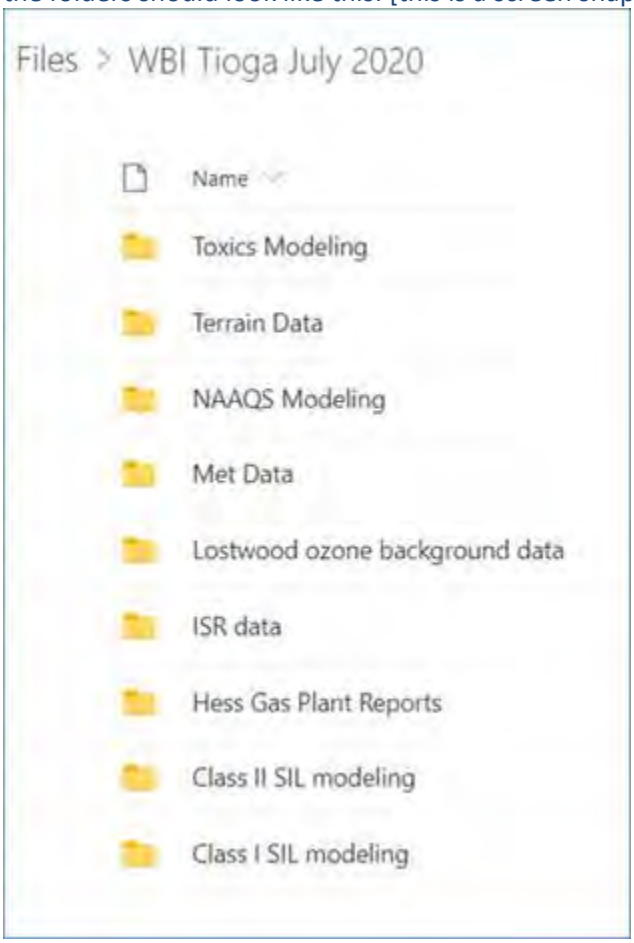
Rheanna –

I have created a folder with subfolders that contain all the electronic files from the updated modeling for the WBI Tioga air permitting.

You will find everything at this web link – this connection should be good for 7 days, let me know if you are not able to acquire all data files before this link expires, and I can refreshe it.

https://theermgroup-my.sharepoint.com/:f:/g/personal/daniel_guido_erm_com/EvoBT3to0gBEnA2ENF_RjlwB3RgY4QgeITuRVmT7pH30wA?e=kIKIxg

the folders should look like this: [this is a screen snap of the primary folder]



When you are able, please send me back a note that confirms that you have all data copied to your local fileserver site.

Afternoon Dan,

The max file size upload on our FTP is 2gb—it should be able to accept ZIP files. I can also send you more than one invite (not sure if you can use the same invite more than once). But if you have an alternative means of transmitting the files that works for me.

Rheanna –

I have compiled all the files from the updated/revised WBI Tioga air permit modeling.
I connected to the ND DEQ file transfer link you sent to me – and notice that this appears to allow ONE FILE TRANSFER AT A TIME.

This may not be practical for what I need to do – I have 267 files (totaling 8.23 GB). I do not have any single file that exceeds the 2000MB file size limitation, but to repeat this transfer step 267 times?

Instead, I will send you a link to download these from a file transfer site where I can place my data – organized in subfolders, etc.
I hope that will work for you as an alternative to the ND DEQ file transfer option you had provided.

I will be sending a subsequent email with the WEB LINK to the folder I can place these files.

LOG OF CONVERSATION

Ms. Thornton called the North Dakota State Water Commission to speak with Gerald Heiser regarding the North Bakken Expansion Project. Mr. Heiser took over for Ashley Persinger on the project when Ms. Persinger left the commission.

Ms. Thornton asked Mr. Heiser if there were any updates on the potential need for a scour analysis. She provided an overview that the Soverign Land Permit Application had been subitted in March of 2020. The geotech work on Lake Sakakawea was completed earlier this spring and an udated application will be submitted in August 2020. She noted that the proposed depth of the alignment has not changed. Mr. Heiser indicated that he would run this by his supervisor and have him bring the information to the director meeting on Monday (July 27, 2020). His initial reaction and recommendation is that the analysis will not be needed, but noted he will confirm and get back to Ms. Thornton next week.

CONFIDENTIALITY NOTICE This Call Log contains information which may be confidential, proprietary, privileged, or otherwise protected by law from disclosure or use by a third party. If you have received this facsimile transmission in error, please contact us immediately at the number listed above and take the steps necessary to dispose of this information. Thank you.

Hi Gerald –

Thanks for taking the time to chat last week. You mentioned that you would be bringing the North Bakken Expansion Project up to your supervisor to discuss at the director meeting this past Monday. Are there any updates from that meeting?

Thanks again,
Andrea

Hey Andrea,
The need for a scour is still being discussed. That's good news on the Geotech, keep us posted. Just another update I will be passing this project onto my supervisor Mr. Gerald Heiser, Sovereign Land Manger for the solicitation process and management going forward. I accepted a new position and my last day with the SWC is this upcoming Friday.

It was a pleasure to work with you and best of luck on your project,

Hi Ashley –

I submitted the Sovereign Land Permit this morning via email (sovereignlands@nd.gov). As we've discussed, we will continue to send you more information on the crossing and updated plans once the geotech work on the lake is

completed. This work is currently scheduled to start at the end of April. The location/depth of the crossing is not expected to change. Any preliminary information that you can provide on the need for a scour analysis would be appreciated. Based on the information in the criteria provided on the application form, it still sounds likes it would not apply for the project

Please reach out if you have any questions or concerns. I'm going to be taking a couple of days off but will still be checking in.

I hope you have a good weekend,
Andrea

Hi Andrea. Thanks for the update! For now our state offices are closed to the public and a great majority of staff, including myself and my direct supervisor Jerry, fully transitioned to remote work. I will be able to check voicemails remotely, but that yet has be set-up. For now email is the best way to get connected with us.

That's good to hear on your application. We are looking forward to getting that project going here. I'm looking into the size limit question on the emails and will get back to you on that.

We are not anticipating changes in review timeframes at this point. We will be pushing document review in the same systems and they seem to be working on point remotely.

Hi Ashley –

I hope you and your family are doing well in this interesting time we are in. I wanted to let you know that I will be working from home full time for the foreseeable future as ERM has temporarily closed all of our offices in North America. Are your offices still open? We are still on track for submitting the Sovereign Land Application this month. Do you know if there is a file size limit for the sovereignlands@nd.gov email submittal?

While I know we are in uncharted waters here, I wanted to see if you had any insights on changes in review time periods given our current situation. Any information that you may have would be helpful.

Thank you and I hope you have a good weekend.

-Andrea

Hi Dawn,

Thanks for the presentation today. The slides will be helpful for future reference as I have done lots of pipelines in state but never crossing state lines. Just confirming that the Water Commission does not need to be a cooperating agency. Our sovereign land permit process and application will give us all the information we need on the crossing of Lake Sakakawea. Andrea and I have been working towards submittal of the sovereign land application for the pipeline crossing. We will be kicking off that process in March which takes average about 90 days.

Andrea thanks for the message yesterday I did receive it this morning before the call. All sounds like we are on track. Discussions happening internally here about the scour analysis policy. Everyone will be in the loop when your application arrives here.

Importance: High

Hello Everyone –

As we discussed on our January 29, 2020 bi-weekly call, the last North Bakken Expansion Project pre-filing call with be on February 12th. In addition to the standard information we have been providing on these calls, FERC will be providing an overview of the FERC process moving forward once WBI Energy's application is filed. Additionally we will be doing an overview of agency comments on the preliminary draft of the applicant prepared EA. We have extended the duration of the call from 1 hour to 1.5 hours to include this additional information.

We encourage all agencies to attend this call! Please let us know if there are any questions.

-Andrea

Attachments: 081220_WBI NBE Soverign Land App.pdf

To: Sovereign Lands Permit Reviewer

From: WBI Energy Transmission, Inc.

WBI Energy Transmission, Inc. (WBI Energy) proposes to install approximately 93 miles of pipeline, including new pipeline, pipeline looping and upgrades to existing pipelines, as well as construction of a new compressor station, upgrades to an existing compressor station, and other appurtenances to transport natural gas from WBI Energy's existing Tioga Compressor Station near Tioga, Williams County, North Dakota, to a new interconnect with North Border's mainline southeast of Waterford City, McKenzie County, North Dakota. The North Bakken Expansion Project (Project) includes a new pipeline that would involve installation of an approximately 62-mile-long, 24-inch-diameter natural gas pipeline that would include the crossing of Lake Sakakawea and U.S. Army Corps of Engineers (USACE)-owned land. WBI Energy is proposing to cross both the lake and USACE property using the horizontal directional drilling (HDD) intersect method.

WBI is submitting the enclosed application for Authorization to Construct a Project within Sovereign Lands of North Dakota (Appendix A) and supporting materials in accordance with North Dakota Administrative Code § 89-10 and the North Dakota Sovereign Land Management Plan. Details regarding the HDD crossing methods and associated plans include the same materials submitted to the USACE for Section 408 permitting, attached as Appendix B. Figure 1, within Appendix B, provides an overview of the proposed Project crossing of Lake Sakakawea. WBI Energy plans to begin construction of the pipeline in May of 2021.

The following appendices are included in this submittal:

- Attachment A - Application To Construct A Project Within Sovereign Lands
- Attachment B - U.S. Army Corps of Engineers Section 408 Permit Application and Attachments

WBI Energy appreciates your assistance and review of the enclosed materials and should you have questions or require additional information during your review, please contact myself or Greg Huncovsky (406) 359-7451.

Respectfully,

Andrea Thornton

Project Will Be Located In Which Water Resource District?
Williams County and McKenzie County Water Resource Districts

LOCATION DESCRIPTION TO THE NEAREST 40-ACRE TRACT

¼	¼	Section	Township	Range
See Figure 1	See Figure 1	S.18 in R.96W; S.36 in R.97W	T.154N	R.96W & R. 97W

Is This Application For Modification Of An Existing Project? ☐ Yes ☒ No

If So, What Year Was Project Constructed? N/A

By Whom?
Project is associated with new proposed natural gas pipeline, proposed by WBI Energy Transmission, Inc., no work has been completed.

Proposed Project Involves

- ☐ Bank Stabilization
- ☐ Boat Ramp
- ☐ Bridge Construction
- ☐ Fish And Wildlife
- ☐ Geotechnical Work
- ☐ Levee/Dike Or Dam
- ☐ Other, Explain _____
- ☒ Pipeline Crossing
- ☐ Recreation
- ☐ Utility Line Crossing
- ☐ Vegetation Control
- ☐ Water Outfall
- ☐ Waste Lagoon
- ☐ Temporary Water Intake
- ☐ Perennial Water Intake
- ☐ Permanent Water Intake Structure
- ☐ Dredge, Volume _____
- ☐ Fill, Volume _____

If Proposed Project Involves A Standard Dock (see Supplemental Measurements Sheet For Standard Docks)

Standard Dock Dimension Shape Project does not include a dock installation. Additional details are provided in Appendix B, the same materials submitted to the USACE as part of the Section 408 Permit application.

About Water Body

Water Body On Which Project Will Be Located
Lake Sakakawea (Missouri River)

Purpose
Natural gas pipeline crossing of Lake Sakakawea.

Project Description
WBI Energy proposes to install a new 62-mile-long, 24-inch-diameter natural gas pipeline from WBI Energy's existing Tioga compressor station to a new interconnect with Northern Borders' mainline southeast of Watford City, North Dakota. The pipeline installation will involve use of the HDD intersect method to install a natural gas pipeline across Lake Sakakawea as part of the proposed North Bakken Expansion Project (Appendix B; Figure 1). The HDD intersect method involves using two drill rigs, one on each side of the HDD, and drilling two pilot holes towards each other until they intersect at a predetermined point. For more details pertaining to the proposed activities see Attachments 1 and 8 of the attached Appendix B, "HDD Plan" and "Risk Assessment". WBI Energy plans to begin construction of the pipeline in May 2021.

Contractor (if known)
Michels

Anticipated Construction Start Date	Completion Date
May 2021	4 to 6 months after start of construction

APPLICANT'S CERTIFICATION

I, the undersigned, am applying for authorization as required under North Dakota Century Code (N.D.C.C.) ch. 61-33 from the Office of the State Engineer. I understand that I must comply with N.D.C.C. ch. 61-33 and North Dakota Administrative Code ch. 89-10-01, and that I must adhere to any conditions required by the State Engineer. I acknowledge that my project is accurately described and depicted in this application as I intend to construct it. My signature below acknowledges that I have read and agree to these statements.

INSTRUCTIONS FOR COMPLETING AN AUTHORIZATION TO CONSTRUCT A PROJECT WITHIN SOVEREIGN LANDS OF NORTH DAKOTA UNDER NORTH DAKOTA ADMINISTRATIVE CODE § 89-10-01-04

A person seeking to construct a project within Sovereign Lands of North Dakota requires authorization from the State Engineer before construction or operation of the project. "Sovereign Lands" means those areas, including the beds and islands, lying within the ordinary high water mark of navigable lake and streams.[1] (N.D.C.C. § 61-33-01). The "ordinary high water mark" is that line on navigable waters below which the action of the water prevents the growth of vegetation, or to restrict its growth to predominantly wetland species.

To be complete, the application must include all information listed below:

1. A completed "Application to Construct a Project within Sovereign Lands of North Dakota" form.
2. A detailed map or drawing of the projects location on an aerial photo.
    i. Size of map must be 8 ½ by 11 inches,
    ii. Map shall have a north arrow and approximate scale, and
    iii. Map shall indicate the proposed work on the drawing.
3. If applying for the installation of a standard dock in which the total length of the dock over the surface of the water does exceed twenty-five feet on a river and fifty feet on a lake, please include measurements requested on "Supplemental Measurements Sheet for Standard Docks".
4. If applying for the installation of a standard dock in which the total length of the dock over the surface of the water does not exceed twenty-five feet AND is located on the Missouri River between the Oliver and Morton County line and Lake Oahe wildlife management area, the project only requires registration with the State Engineer. Please complete the "Registration for Placement of a Dock Under 25 Feet-Long on Specified Waters" form (SFN 61441).
5. If applying for the installation or modification (including change in transported liquid) of a pipeline which transports crude oil, natural gas liquids, or any other hazardous liquid, as determined by the State Engineer, the Applicant must first conduct a scour analysis specific to the proposed crossing for project design purposes.[2]
6. If applying for the installation of riprap or other bank stabilizations, please include a cross sectional drawing of the proposed work which includes the existing and proposed grade and the present location of the water surface.

Further Sovereign Land Permit Guidance:

1. A permit would be required if any portion of the project would occur within, under, or over a navigable water of North Dakota.
2. A permit would be required if any portion of the project would occur below the ordinary high water mark.
3. The permit applicant is responsible for obtaining any other local, state, or federal permits or permissions that may be necessary prior to construction of a project on Sovereign Land.
4. There is no fee administered for a Sovereign Land Permit.
5. Please allow at least 90 days for Sovereign Land Permit processing.
6. Please notify the Office of the State Engineer of project completion at *sovereignlands@nd.gov*.
7. Unless specified, there is no expiration date on an obtained Sovereign Land Permit.

---

[1] North Dakota's Navigable Waters as of 2018: Missouri River, James River, Sheyenne River, Pembina River, Mouse River, Red River of the North, Bois De Sioux, Knife River, Heart River, Cannonball River, Yellowstone River, Devils Lake, Lake Metigoshe, Painted Woods Lake, Sweetwater Lake, Upper Des Lacs Lake, and Long Lake(Bottineau County). List subject to change.

[2] The minimum depth-of-burial for pipelines transporting crude oil, natural gas liquids, or any other hazardous liquid as determined by the state engineer must be total calculated scour plus four feet from the bed of the river to top-of-pipe for pipelines crossing the state's navigable rivers. (N.D.C.C. ch.61-63).

Intro:
The proposed Lake Sakakawea/Missouri River HDD crossing consists of installation of ~15,442' of 24" steel pipe. HDD has been the selected installation method to minimize surface and water body disruption/impact. Environmental considerations were also a factor in choosing HDD as the construction method. HDD is a trenchless installation method that installs the pipeline far deeper under the waterbody with minimal surface and environmental impact when compared to traditional open-cut installations.

Drill Support and Manpower:
Michels proposes drilling and installing this crossing utilizing the pilot-hole intersect method, which requires cutting edge directional drilling technology & the use of two drill rigs drilling simultaneously toward each other in performance of the installation. Michels has been perfecting this unique cutting-edge method for the past 12-years, while successfully completing numerous complicated and long distance directional drill installations that otherwise would not have been attempted. Each drill rig site requires one shift of 8-12 men. The primary drill rig to be utilized will be a minimum DD-840 Drill Rig with the secondary rig being a minimum DD-840 Drill Rig. The crews will be scheduled to work approximately 12 to 14 hours per day and up to 7-days per week. 24-hour per day operations may be required at any given time on the crossing depending on conditions encountered in the bore-hole & specific requirements which must be met. Michels reserves the right to supply and substitute personnel as required but will provide WBI Energy notice prior to personnel changes being implemented.

Drill Configuration/Geometry:
Directional drilling using the pilot-hole intersect method is proposed for this crossing. The planned borehole geometry is anticipated to follow the attached HDD plan and profile drawing. Adequate depth of cover should be maintained beneath contours and obstacles in accordance with industry standards at all crossings to minimize the risk for inadvertent drilling fluid returns. The HDD crossing will be installed within the tolerances listed in the construction contract so that the factor of safety ratings will be maintained. Conductor casing may also be installed at either or both the entry and exit locations in order to traverse unconsolidated formation if necessary, this is done in order to alleviate conditions associated with inadvertent drilling fluid returns and settlement or to allow a better transition into more consolidated formation.

(Attachment – HDD Plan and Profile Drawing)

Drill Work Sites Preparation:
The drill work sites required for staging equipment should be prepared by the prime contractor readied for Michels' mobilization to the job site. Cleared and level work pads at both sides of the crossing are necessary for the support and movement of semi-trucks and heavy equipment. The pad may require the installation of matting, gravel or other means for a stable workable surface. A work pad is required at both sides of the proposed crossing capable of supporting a drill rig with ancillary equipment. The two work areas are shown on the attached HDD design drawing and pipe laydown drawing. The two work areas should be connected by a straight centerline alignment. A drill rig dead-man is typically installed in front of the unit to support minimal movement of the rig during drilling operations. The dead-man consists of an 8' x 20' steel plate installed vertically down into the ground placed in front of the rig. It is used to distribute load bearing support across and to the surrounding ground formation during rigorous drilling operations.
(Attachment – Anticipated Entry/Exit Equipment)
(Attachment – HDD Equipment Noise Information)

Pilot Hole:
Michels uses two main pilot hole tracking systems for large scale HDDs such as the Lake Sakakawea / Missouri River crossing. The first being a wireline tracking system called the Para-track system. This system requires a surface cable or solenoid. The second pilot hole tracking system is the Gyroscope which requires no surface cable or solenoid. The typical hole intersect procedure for the two systems are described separately below.

Hole Intersect using the Para-Track System
A 12-1/4" drill bit is advanced from the entry points (Rig Side Entry and Pipe Side Entry) toward the pre-designated intersect point along the proposed bore-hole path alignment using a directional jetting bottom-hole assembly or mud motor with bit and bottom-hole assembly. The pilot hole drilling from Rig Side Entry can be prior to or concurrent with pilot hole drilling from the pipe side entry as intersect procedures do not have to occur at exactly half the distance. The intersect location ±500 feet is pre-determined prior to drilling however, conditions encountered during pilot hole drilling will dictate the approximate location of performing the intersect. The bottom-hole assembly will be advanced from the entry side toward the second pilot-hole projection which will be drilled or is being drilled from the other side. The bottom-hole assembly includes the bit (12-1/4" in diameter), drilling mud motor if required, orientation and pressure measurement sub, steering guidance tool (Vector Magnetics Para Track2 Survey and Guidance System) and non-magnetic drill collars. The drill stem

© Copyright, Michels Directional Crossings, a Division of Michels Corporation, 2020

added behind this bottom-hole assembly will be S-135 grade 7 5/8" FHDS (Full Hole Double Shoulder) series drill pipe or better and in random 30(±) foot lengths.

The location of the pilot-hole drill paths will be continuously monitored, surveyed then recorded from its respective drill rig location utilizing the data from the down-hole probe (Para Track2 Probe) as drilling proceeds. Critical tracking information to be processed includes elevation, alignment and distance away from each rig which is calculated then recorded in accordance with industry standard, once at the end of every drill stem length (approximately 30-feet).

Constant communication is maintained between the two drill crews as pilot-hole intersect operations progress. Prior to the pilot holes reaching the projected intersect location, the magnetic signal being monitored on the instrument tracking computer inside the control trailer will increase in strength. After the two pilot holes are overlapped by approximately 30', a PMR (Passive Magnetic Ranging) survey will be conducted. At this time, the Para Track2 Probe will be used to collect static magnetic field readings relative to the adjacent drill stem. To perform this operation, the 7 5/8" drill pipe positioned in the previously drilled borehole from the entry end will be retracted in predetermined distance increments, these distance retractions are sensed by the probe and recorded. The magnetic field readings collected by the Para Track2 probe will then be analyzed to verify that sufficient and accurate data has been collected and a position offset between the two boreholes can be calculated and determined. This PMR survey will be repeated once every 30' until the two boreholes are connected.

Hole Intersect using the Gyroscope System

A 12-1/4" drill bit is advanced from the entry points (Rig Side Entry and Pipe Side Entry) toward the pre-designated intersect point along the proposed bore-hole path alignment using a directional jetting bottom-hole assembly or mud motor with bit and bottom-hole assembly. The pilot hole drilling from Rig Side Entry can be prior to or concurrent with pilot hole drilling from the pipe side entry as intersect procedures do not have to occur at exactly half the distance. The intersect location (±500 feet) is pre-determined prior to drilling however, conditions encountered during pilot hole drilling will dictate the approximate location of performing the intersect. The bottom-hole assembly will be advanced from the entry side toward the second pilot-hole projection which will be drilled or is being drilled from the other side. The bottom-hole assembly includes the bit (12-1/4" in diameter), drilling mud motor if required, orientation and pressure measurement sub, steering guidance tool (Gyroscope Guidance System). The drill stem added behind this bottom-hole assembly will be S-135 grade minimum 7 5/8" FHDS (Full Hole Double Shoulder) series drill pipe or better and in random 30(±) foot lengths.

The location of the pilot-hole drill paths will be continuously monitored, surveyed then recorded from its respective drill rig location utilizing the data from the down-hole probe (Gyroscope) as drilling proceeds. Critical tracking information to be processed includes elevation, alignment and distance away from each rig which is calculated then recorded in accordance with industry standard, once at the end of every drill stem length (approximately 30-feet).

As the pilot holes approach the planned intersect area the following steps are typically followed to complete the intersect:

1. A pair of radars are placed, one behind each gyro on either side.
2. The drilling surveyors on both sides stay in contact sharing their survey data as the bore progresses.

© Copyright, Michels Directional Crossings, a Division of Michels Corporation, 2020

3. When they get within 30’ of the bits overlapping, one side will pull a joint of pipe to the top of the rig and wait for the opposite side to overlap their hole with the bit.
4. While the drilling side is progressing, the other side will monitor annular pressure (if annular pressure is being monitored) and watch for vibrations indicated on survey readouts.
5. If at this time the drilling side notices any changes to the push or rotation indicating they may be coming into the hole drilled from the opposite side, the side which is waiting will slowly push down and see if they bump into the other bit. If they do bump, the drilling superintendent and surveyors will then decide based on the angles at which the intersect occurred, the push and torque on the strings of pipe, and the distance from the intersect point to the ends of the hole, which side will push out of the ground. They will also decide, based on ground conditions how much space to keep between the bits as one side pulls back and the other pushes forward.
6. If the bits do no bump after the two holes are overlapped in a horizontal direction, the side which is not drilling forward will pull back drill stem and bit an appropriate distance so that the drilling side can drill far enough forward without the bits being overlapped until the side which is waiting can push down slowly while the other side monitors for vibrations until the radars are parallel to each other.
7. At this time the surveyors will take a radar survey. Based on the survey, the drilling superintendent and surveyors will determine the best option to drill from one side or the other until the holes are intersected. Usually, another radar survey will be taken in 1 to 3 drill pipes as the hole progresses to verify that the distance between the holes is matching what is expected based on the first set of data.
8. When the holes get close enough in a lateral and vertical direction that intersection is expected one side will pull back far enough that the drilling side can safely drill into the hole without causing damage to the tools. When the drilling superintendent and surveyor believe based on the pressures and survey data the holes are intersected, the other side will push down slowly until the bits are verified to have touched. Usually this is accomplished by pushing until either the push pressure rises above that in open hole, or the other side notices movement. Then one side will move a set distance and see if the other side can now push freely again.
9. When it is verified that the holes are intersected the drilling superintendent and surveyors will then decide based on the angles at which the intersect occurred, the push and torque on the strings of pipe, and the distance from the intersect point to the ends of the hole, which side will push out of the ground. They will also decide, based on ground conditions how much space to keep between the bits as one side pulls back and the other pushes forward. They will also decide, based on ground conditions how much space to keep between the bits as one side pulls back and the other pushes forward.
10. If the ground is soft, it can be necessary for both sides to bump the bits against each other and one side to push as the other side pulls back slowly maintaining contact with the bits to insure that the pushing side stays in the hole.

Drilling Fluids:

Essential to any successful HDD process is the selection and proper utilization of drilling fluid, which is primarily made up of water and bentonite having pH values between 8 and 9. Bentonite is a naturally occurring, non-toxic, inert substance that meets NSF/ANSI-60 Drinking Water Additive Standards and is used for drilling potable water wells. Often soda ash is added to the drilling fluid to increase the pH to 8 and reduce the soluble calcium. This allows bentonite to perform at its maximum and reduces the amount of bentonite added to the drilling fluid. Soda ash is also NSF standard 60 certified and is used to drill potable water wells. Using these products minimizes the impact to any environmentally sensitive area in the unlikely event that an inadvertent return should occur.

Bentonite serves many notable purposes in the HDD process, which includes but is not limited to:

1) Cleans the drilled cuttings from the bore hole and cools the drilling tools,
2) Transports cuttings to the surface for recycling,
3) Aids in stabilizing formations by supplying a cohesive nature to the surrounding geological formation and preventing fluid loss from the bore hole,
4) Provides lubrication for the drill string and downhole assembly, which reduces frictional forces at the formation,
5) Drives a down-hole drill motor for rock drilling,
6) Provides hydrostatic fluid pressure in the bore hole to offset ground formation pressures.

Drilling fluid is composed of a carrier fluid and solids. The selected carrier fluid for this crossing consists of water (approximately 96%) and an inorganic, bentonite clay (approximately 4%). Michels has access to

© Copyright, Michels Directional Crossings, a Division of Michels Corporation, 2020

several different brands of bentonite. The selection of which brand to use is typically based on price, availability and proximity to the proposed drill site. The following brands all exhibit similar characteristics providing the same results as listed above.
(Attachment – Potential Bentonite Brands – Product Data Sheets/MSDS Sheets)

Potential Bentonite Brands

- Max Gel
- Super-Gel X
- Bara-Kade

The bentonite will be mixed in a mud mixing tank of up to 5,000 gallons, depending on mud rig size, in accordance with manufacturer's recommendation. Approximately 15 to 20 pounds of powder bentonite will be mixed with 100 gallons of fresh water *(Mud Composition),* and will be used throughout the entire drilling process to establish and maintain optimum drilling fluid properties. Estimated proportions listed above are based on past experience and do not take into account unexpected conditions encountered. Michels maintains fluid performance through the daily sampling, testing and recording of fluid properties throughout drilling operations. This provides Michels' Mud Technician the information required to make educated recommendations regarding maintenance of efficient drilling fluid rheology consistent with hole-stabilization with the intention of limiting inadvertent surface returns and optimizing drilling fluid performance. Following is one of the tables used as a guideline by the Mud Technician referencing recommended fluid consistencies targeted during typical testing. Consistencies of powder and water are varied to achieve these recommended viscosities.

Targeted Drilling Fluid Viscosities Recommended	
Sand	60-80 Viscosity
Silt	50-70 Viscosity
Clay	40-50 Viscosity
Rock	60-80 Viscosity
Gravel	70-90 Viscosity

Once the drilling fluid is thoroughly mixed to an acceptable consistency, it is pumped from the mud tank to the back end of the drill rig. From here it is injected under high pressure through the drill stem at a rate of between 300 to 800 gpm to the apex of the drill head. The spent drill fluid with mixed cuttings maintains a return flow back along the annular space created between the drill stem and the formation wall. Drill fluid returns to the entry pit where it is pumped by a 6hp submersible pump to the fluid recycle and processing system.

Additives may be deemed necessary based on evaluations and recommendations made by the Mud Technician during drilling and hole-opening operations. If the need for drill fluid additives does arise, it is anticipated that one of the attached additives may be required in order to maintain adequate fluid rheology down-hole. Michels formally submits the attached drilling fluid additives for approval and use on this project. (Attachment – Drilling Additives / LCMs for approval)

Reaming Passes:
Michels anticipates performing one ream pass with a final hole dimeter of ~36" accommodate the 24" steel pipe. However, the final determination as to size and number of ream passes will be based on conditions encountered during pilot-hole drilling and the initial reaming operation.

The reamers proposed for the crossings will be various types of dirt and rock reamers custom fabricated by Michels specifically for this type of formation, which could include conventional fly-cutter type reamers and hole-openers. Michels also has additional resources for various rock-tooling which can be supplied at a moment's notice if needed. Equivalent or better tools may be substituted depending on availability of other supplier's products or if changes in anticipated drilling conditions are encountered.
(Attachment- Michels' Downhole Tools)

Cleaning Pass:
A swab pass will need to be conducted up to the same size as the final ream pass but no larger. The swab pass is typically pulled back from exit to entry.

Drill Mud Cleaning:
The first phase of the mud cleaning system is displacement of solid returns at the shaker. Heavy solids are sifted out by a shaker with screens and deposited into a pit. From here they will be transported by dump truck to a site for disposal.

Drill Mud Cleaning Equipment Specifications

Volume of Mixing/Scalper Tank	54.0-Bbls
Volume of Desander Tank	72.0-Bbls
Volume of Desilter Tank	72.0-Bbls
Quantity of Scalping Shakers	1.0-Shakers
Mesh Size of Scalping Shakers	10-20 Double Stacked
Desander Capability	2 @ 500-GPM (1,000 GPM Total)
Desander Cones	2.0-Cones
Desander Mesh Size	40 to 165
Quantity of Desilter Cones	10 Ea @ 100-GPM
Desilter Mesh Size	60 to 250
Steel Mud Circulating Tank Volume	160-Bbls
Returns Tank Volume (Mud Pit)	320-Bbls
Cuttings Tank Volume (20-yd Roll-off)	150-Bbls
Mud Screening, Max Pass Size	40-Mesh

(Attachment – Mud Cleaning Equipment Specifications)

Bentonite Pump Capabilities (ENTRY/EXIT) (Based on Availability)

Name Brand	Ellis Williams W-446 Triplex Piston Model
Liner Size	6-Inches
Maximum Pressure	1,027 PSI
Maximum Flow Rate	661 GPM
Gallons Per Stroke	2.20 Gallons Per Stroke

Bentonite Pump Capabilities (ENTRY/EXIT) (Based on Availability)

Name Brand ..... Gardner Denver OPI-350
Liner Size 6-Inches
Maximum Pressure .....1,469 PSI
Maximum Flow Rate..... 529 GPM
Gallons Per Stroke ..... 2.94 Gallons Per Stroke

Pull Pipe:
The 24" pipe will be welded and placed on top of rollers in preparation for pullback. The pipe will be pulled into place utilizing an approved pull head, swivel and reamer from exit to entry. This is a continuous operation which takes place until the product pipe is pulled through the opened hole back to the entry point.
(Attachment - Michels' Support Rollers)

Contingency Planning:
Contingency planning is conducted in response to unforeseen events and conditions which could occur during normal operating sequences.

Included in the contingency plans, Michels has developed an environmentally responsive set of contingency plans including contingency planning for inadvertent returns to be invoked for expeditious attention and handling of various incidence as they arise.
(*Attachment – Contingency Plans for HDD crossing)*

Solids Control and Separation:
The first phase of the mud cleaning system is displacement of solid returns at the shaker. Solid control systems will vary for the various drill rigs however the end product is the same. Heavy solids are sifted out by a shaker with screens and deposited into a pit. From here they will be transported by dump truck to a site for disposal. Spent drill fluids are collected at the drill site and transferred to tanker trucks for disposal at an approved location. *(Attachment – Drill Fluid Recycle Flow Chart)*

Demobilization:
Excess drilling fluid is removed from the site and transported to the approved disposal site. Equipment and personnel will be moved off-site after successful completion of the hydrostatic test and clean-up operations will take place. Mud pits will be backfilled with the native soil that was excavated and temporarily stored. Topsoil will be segregated separately from the subsoil and backfilled appropriately to restore conditions as close to pre-construction as possible.

PERSONNEL STATEMENT

Personnel for each newly contracted job, from the Project Manager to the Mud Technician, are duly assigned to a project based on a number of circumstances. These may include but are not limited to the following; current projects under contract, geographic location of previous project, scope of work required for the directional drill. Our personnel and equipment have been assembled so that they are interchangeable from project to project.

The key to any directional drilling project is obviously having qualified personnel who are experienced in dealing with unforeseen circumstances as they arise. Michels' personnel are some of the most experienced and highly qualified drilling experts in the industry, as demonstrated on past projects accumulated on our reference list. With the appropriate resources at their disposal, Michels has overcome risks associated with some of the most difficult drilling projects ever attempted and has evolved into one of the foremost leaders in the directional drilling industry.

Each of the Drilling Superintendents employed by Michels is highly experienced in utilizing drill rigs of every size. Michels' Drilling Superintendents are well respected throughout the industry, as represented on the attached resumes. Each has completed countless difficult drills including installation of large diameter pipe and at great lengths. Our Drilling Superintendents have worked up through the ranks providing them a complete and comprehensive understanding of safety, hazards, environmental monitoring, manpower, equipment operations and repairs for each phase of the directional drilling operation. Michels' personnel maintain continuous schooling for all phases of the drilling operation.

As noted on the attached resumes, each Superintendent has drilled throughout North America as well as internationally, and has encountered various soil conditions, from sands, gravels, clay and cobble to solid rock formations.

MICHELS®

Jeffrey S. Mueller

Vice President

PROFESSIONAL EXPERIENCE

2020 – Present: **Vice President | Michels Directional Crossings | Brownsville, WI**

Responsible for horizontal directional drilling division construction operations. Duties include profit and loss responsibility for multiple and simultaneous directional drilling gas, product, water, sewer, civil, electric, telephone cable, and environmental projects. Day-to-day involvement with bid estimating, construction feasibility evaluation, specification and design criteria review, proposal preparation, contract and subcontract negotiations, project planning and oversight, cost scheduling, allocation of divisional resources, and interface with utility construction managers, engineers, and owners. Report directly to the Senior Vice President and President of the company.

2003 – Present: **Operations Manager | Michels Directional Crossings | Brownsville, WI**

Supervisor of field operation superintendents and directional drilling project managers. Oversee large inventory of drilling tools and materials during storage and field use. Monitors production by Fleet Department of directional drilling personnel and equipment. Duties include coordinating and scheduling the mobilization of equipment, personnel and materials to remote job sites throughout the United States and Internationally. Involved in estimating of various directional drilling projects. Specialize in the engineering design, build and maintenance of directional drilling fleet. Responsible for pilot hole drilling & survey for complicated bores which include implementing and integrating new technology necessary for successful completion of leading edge HDD crossings (i.e. hole-intersects). Complete project experience available upon request.

Some more notable crossings include, but are not limited to:

Diameter	Length	Crossing/Location	Year
42"	3980'	Susquehanna River MP 99.6, PA	2018
20"	7354'	Susquehanna River, PA	2018
36"	6238'	Ohio River, OH/WV	2017
30"	3483'	Ford Island to Landing C, HI	2017
42" Steel with 36" HDPE	3983'	St John's River, FL	2016
30"	6119'	Lake Whitney, TX	2016
12"	11,548'	Union Canal & Martin Barge Canal, TX	2015
24"	7432'	Houston Ship Channel, TX	2015
12"	11,563'	Holland Bottoms Wetlands, AR	2015
18"	12,459'	Houston Ship Channel, TX	2015
6"	6999'	Navajo Reservoir/San Juan River, NM	2014

PROFESSIONAL EXPERIENCE (continued)

Diameter	Length	Crossing/Location	Year
48"	2060'	Tres Palacios River, TX	2014
36"	9040'	Mississippi River & Levees, Il/MO	2014
42"	3008'	I-95 & Tidal Wetlands, NJ	2013
30"	6544'	1st Street, NJ	2013
42"	4441'	Goethals Bridge, NY	2013
30"	8101'	Kill Van Kull River, NY/NJ	2013
30"	5378'	Hudson River, NY/NJ	2012
30"	4850'	Red River, TX/OK	2012
42"	4519'	Freeman Road, LA	2011
42"	5117'	Nature Conservatory, LA	2011

1996 – 2003: **Field Operations Superintendent | Michels Directional Crossings | Brownsville, WI**

Responsible for coordinating and drilling directional boring projects for various size gas, water, sewer, electrical and communication lines as well as environmental wells. Duties include mobilization of all equipment and personnel to remote job sites throughout the United States; the set-up and drilling of crossings; on-site maintenance of mechanical and technical equipment; and necessary record-keeping of plots and production. Oversees drilling survey during crossing.

1991 – 1996: **Drilling Survey Technician | Michels Directional Crossings | Brownsville, WI**

Responsible for surveying, staking and design of directional drill path and curve, monitoring the drill path and calculating and interpreting the ground elevations and contours. Computer literate with knowledge and experience operating various software. Complete surveying skills and experience utilizing a Total Station for lay out of grade elevations over all types of topography in establishing alignment tying into existing surveyed points. Additional duties include on-site maintenance of technical equipment and necessary record-keeping of plots and drilling logs.

1989 – 1991: **Skilled Laborer | Michels Directional Crossings | Brownsville, WI**

Experience in working on and around directional drilling rigs as an integral member of a specialized team. Multi-capable to assist with all facets of drilling operations. Familiar with mechanical repairs; hydraulics; fluids; set-up and operation of drill motors; power generators; mud pumps; bentonite mixers; drill pipe; reamers; couplings; and overall equipment maintenance and operation.

EDUCATION

1989 **Lomira High School | Lomira , WI**

High School Diploma

Tim McGuire

Senior Advisor

PROFESSIONAL EXPERIENCE

2020 – Present: **Senior Advisor | Michels Directional Crossings | Brownsville, WI**

Provide advice in the management of domestic and international horizontal directional drilling operations. Responsibilities include business development, contract procurement and negotiation, project oversight and management, and client communication.

2002 – 2020: **Vice President | Michels Directional Crossings | Brownsville, WI**

Responsible for horizontal directional drilling division construction operations. Duties include profit and loss responsibility for multiple and simultaneous directional drilling gas, product, water, sewer, civil, electric, telephone cable, and environmental projects. Day-to-day involvement with bid estimating, construction feasibility evaluation, specification and design criteria review, proposal preparation, contract and subcontract negotiations, project planning and oversight, cost scheduling, allocation of divisional resources, and interface with utility construction managers, engineers, and owners. Report directly to the Senior Vice President and President of the company.

1998 – 2002: **General Manager | Michels Directional Crossings | Brownsville, WI**

1994 – 1998: **Project Engineer/Project Manager | Michels Corporation | Brownsville, WI**

1992 – 1994: **Division Manager | Michels Environmental Services | Brownsville, WI**

1991 – 1992: **Drilling Division Manager | Harrison Western Mining Corporation | Denver, CO**

1987 – 1992: **Project Manager/Geotechnical & Environmental Engineer | Ebasco Corporation | Denver, CO**

INDUSTRY INVOLVEMENT

- MCI Engineer Training Seminar “Horizontal Directional Drilling Design, Specification and Construction for Trenchless Placement of Underground Utilities”
- Midwest Gas Association “Horizontal Directional Drilling Large Diameter Pipeline Installations”
- National Groundwater Association Outdoor Action Conference “Horizontal Directional Drilling Demonstration for Installation of Horizontal Wells”

EDUCATION

Colorado School of Mines | Golden, CO

Bachelor of Science: Geological Engineering - Minor: Hydrogeology

MICHELS®

Matthew Smith

General Manager/Contracts & Business Administration

PROFESSIONAL EXPERIENCE

2019 – Present: **General Manager/Contracts & Business Administration | Michels Directional Crossings | Brownsville, WI**

Oversee day-to-day divisional business operations and management of operational costs.
Duties include profit and loss responsibility for multiple and simultaneous trenchless construction projects in the oil/gas, civil, power and communication business sectors.
Day to day involvement with bid estimating, construction feasibility evaluation, specification and design criteria review, contract and subcontract negotiations, project planning, cost scheduling and interface with utility construction managers, engineers and owners.

2013 – 2019: **Manager-Direct Pipe | Michels Directional Crossings | Brownsville, WI**

Responsible for coordinating Direct Pipe projects for various size gas, water, sewer, electrical and communication lines. Assists with project design and methods of operation. Oversees clarification and interpretation of construction drawings. Assumes accountability for the direction and performance of construction personnel. Oversees project schedule, safety, profitability and cost control. Direct pipe installations/pipe assists:

Diameter	Length	Crossing/Location	Year
48"	651'	Juniata River, PA - HK 750PT Installation	2018
42"	484'	Highway 50, West Virginia - HK 500PT Installation	2018
36"	856'	Qu`Appelle River, Canada - HK 750PT Installation	2017
36"	1,280'	Highway #1, Canada - HK 750PT Installation	2017
36"	1,027'	United Blvd & Mundy Creek, Canada - HK 750PT Installation	2017
36"	1,047'	Lougheed Hwy, Canada - HK 750PT Installation	2017
42"	7,200'	Athabasca River, Canada - HK 750PT Installation	2016
36"	827'	Leslie Street, Ontario, Canada - HK 300PT Installation	2015
42"	1,299'	Lisgar Meadowbrook, Ontario, Canada - HK750PT Installation	2015
42"	1,008'	Highway 63, Canada - HK750PT Installation	2015
48"	4,039'	Dow Barge Channel, Clute TX - HK750PT Installation	2015
36"	1,002'	Hwy 225, Deer Park, TX - HK300PT Installation	2015
36"	1,092'	Lubrizol Drainage, LaPorte, TX - HK300PT Installation	2015
48"	2,455'	Rio Grande River, El Refugio, TX - HK750PT Installation	2014
42"	1,200'	Railroad Crossing, Groves, TX - HK750PT Installation	2014
42"	1,050'	Beaver River, Alberta, Canada - HK750PT Installation	2013
42"	470'	I-84, Westfall, PA - HK750PT Installation	2013

PROFESSIONAL EXPERIENCE (continued)

2013: **Project Manager | Michels Tunneling | New Berlin, WI**

Responsible for overall site/field management and safety of microtunneling/tunneling projects. Monitor project budget including month end computations and projections. Coordinate project development between project engineer, superintendent and foreman. Prepare/submit all submittals, RFIs, extra work, contract change orders and pay requests.

2011 – 2013: **Project Engineer | Michels Tunneling | New Berlin, WI**

Planned, scheduled, conducted, and coordinated assigned engineering work; monitored work for compliance to appplicable codes, accepted engineering practices, and ensured effective communication and coordination on projects between all disciplines and project participants.

2010: **Engineer Internship | Michels Tunneling | New Berlin, WI**

2009: **Pipeline Laborer | Michels Pipeline Construction | New Berlin**

2003 – 2007: **Concrete/General Laborer | Forino Developers | Skinking, PA**

PROJECT PROFILES

OCI Project No. DB10-WASD-01 ESP - Miami, FL
Mico-tunnel installation of 1200 LF of 72" Permalok steel casing under the Government Cut Channel in Miami. The casing will be installed through the coral rock formation from a shaft constructed by others on Fisher Island to a shaft in the water off South Beach.

Intracoastal Waterway Pipeline Relocation, Galveston Causeway, Galveston, TX
700' of 48" Permalok tunnel drives through clay underneath the Galveston Bay for installation of new waterline for the City of Galveston. Michels Tunneling was the 4th contractor to attempt this project and completed it successfully and under budget.

Akron II - Akron, Ohio
The second phase of a sewer installation, including 2 microtunneling runs installed 1,086 LF 48" Hobas.

Massillon Road Sanitary Sewer Improvement - Akron, Ohio
Massillon Road 2,925 LF of 42" Cenrifugally Cast Fiberglass Reinforced Polymer Motar Pipe sanitary sewer gravity sewer, microtunnel installation; 1,328 LF of 48" CCFRPM pipe on micropile support, 29 LF of 36" OH CCFRPM pipe, gravity sewer, micropile support. 7 EA shaft excavations with steel sheeted ground and 7 EA manholes structures. 250 LF of open cut excavation with steel sheeted support.

SFPUC Bay Tunnel - San Francisco, CA
The project includes 26,208 LF of 12'-10" diameter concrete segmented tunnel under the San Francisco Bay from Menlo Park on the S.F. Peninsula Bay to Newark in the East Bay area, two slurry diaphragm wall shafts, and 108" cement motor lined steel pipe welded in the tunnel and shafts as a final liner carrier pipe.

TRAINING & CERTIFICATIONS

- Crane Signaler Certified
- Confined Space Certified

INDUSTRY INVOLVEMENT

- 2018 Trent Ralston Young Trenchless Achievement Award
- No-Dig Paper Presentation (2019): Crossing the Calumet

INDUSTRY INVOLVEMENT (continued)

- No-Dig Paper Presentation (2018): Lengthy crossings shortened by Direct Pipe Technology
- No-Dig Paper Presentation (2017): Direct Pipe method using water

EDUCATION

Gonzaga University | Spokane, WA

Bachelors of Science: International Business

Greg Goral

Senior Design Engineer

PROFESSIONAL EXPERIENCE

1988 – Present: **Senior Design Engineer | Michels Directional Crossings | Brownsville, WI**

Create forms for and compile various informational submittals for Directional Drilling and Line and Cable Divisions. Planning and design drawings on AutoCAD from preliminary designs to as-built drawings. Developed computer programs for simplifying preliminary and correction computations required for Directional Drilling. Composed dissertations for various projects proposed and awarded. Compiled engineering computations and studied stress and loading analysis for pipeline installation. Responsible for take-offs, material estimates, material purchasing and project coordination, and map route reproduction.

1986 – 1987: **Estimator/Purchasing | LaForce Hardware and Manufacturing | Green Bay, WI**

Involved in the bid process using skills in estimating and pricing. Scheduled materials for architect's review and approval. Responsible for the purchasing of materials and coordinating shipments to job sites.

1981 – 1984: **Machine Operator | Badger Wood Products, Inc. | De Pere, WI**

Machine operator responsible for setup operations for various machines in a production line process. Responsible for quality control at various machines.

TRAINING & CERTIFICATIONS

- Construction Materials & Techniques
- General Construction Estimating
- Route Laying and Photogramitry
- Engineering Mechanics-Statics
- Elements of Surveying

EDUCATION

1986 **University of Wisconsin–Platteville | Platteville, WI**

Bachelor of Science with Construction Management Major

MICHELS®

Dustin Branscomb

Trenchless Engineer

PROFESSIONAL EXPERIENCE

2018 – Present: **Trenchless Engineer | Michels Directional Crossings | Brownsville, WI**

Responsible for the design & engineering evaluation of trenchless pipeline installations, inclusive but not limited to design & build projects, constructability, feasibility, plan & procedure creation, pre-qualifications, calculations, specification review and/or insight, bid & proposal process, submittals, estimating, scheduling, pre-bid meeting attendance, pre-construction meeting attendance, as-built's, design changes, and ensuring project continuity from inception to execution.

2011 – 2018: **Drilling Survey Supervisor | Michels Directional Crossings | Brownsville, WI**

Responsible for surveying, staking and design of directional drill path and curve, drilling the pilot hole, tracking and monitoring the drill path and calculating and interpreting the ground elevations and contours. Computer literate with knowledge and experience operating various software including: 1) Magnetic Guidance System, 2) Survey, 3) Tru-Tracker and 4) Microsoft applications. Applied working knowledge of advanced mathematics including: 1) Fluid Dynamics, 2) Advanced Algebra, 3) Trigonometry, 4) Calculus, 5) Statistics and 6) Stress Engineering. Complete surveying skills and experience utilizing a Total Station (Theodolite with built-in EDM) for lay out of grade elevations over all types of topography in establishing alignment tying into existing surveyed points (benchmarks). Additional duties include on-site maintenance of technical equipment, and necessary record-keeping of plots and drilling logs. Performed the above operations for crossings which include, but not limited to:

Diameter	Length	Crossing/Location	Year
42"	3087'	Victoria Harbor, Canada	2018
36"	1511'	Hwy #1, Canada	2017

42” Steel	2078’	South Amboy, NJ	2006
24” Steel	24,000’ (6 Drills)	Sacramento, CA	2005-2006

EDUCATION

2005 **Moraine Park Technical College | Fond du Lac, WI**

Associate Degree- Civil Engineering Technician

1995 **Hartford Union High School | Hartford, WI**

High School Diploma

Zach Osborn

Estimator

PROFESSIONAL EXPERIENCE

2019 – Present: **Estimator | Michels Directional Crossings | Brownsville, WI**

Prepare estimates for Directional Drill projects across the United States. Review designs and feasibility of projects. Point of contact for customers during bid process. GIS mapping and tracking of current bids. Follow up on project status. Hand offs to operations when a project is awarded.

2017 – 2019: **Assistant Project Manager | Michels Pipeline Construction | Lakeville, MN**

Oversee projects and provide estimates. Manage projects through the full cycle. Profile HDD's for crews and create asbuilts on completed projects. /worked directly with customer with HDD feasibility and design. Pursue new business opportunities and customer relations. Some more notable crossings include, but are not limited to:

Diameter	Length	Crossing/Location	Year
10"	1948'	Roads & Bluff, MN	2019
24"	2000'	Woods and Creek, MN	2019
8"	4650'	Little Falls, MN	2019
16"	1200'	Hwy & Railroad, MN	2018
10"	2450'	Missouri River, MT	2018
24"	1200'	I-494, MN	2018
24"	1800'	Crossing Bluff, WI	2017

2015 – 2017: **Foreman | Michels Pipeline Construction | Lakeville, MN**

Point of contact for non contract bores for the Distribution West Division. Managed and tracked units for billing. Time and equipment recording. Managed HDD worksite and constructed gas service work. Worked with distribution crews on miscellaneous projects around the Twin Cities Metropolitan area.

2009 – 2015: **Laborer/Operator | Michels Pipeline Construction | Lakeville, MN**

Labored and Operated equipment for the Distribution West Division. Worked with HDD Operations. Fused for outside projects outside of Centerpoint contract. Traveled and worked on out of state projects.

PROFESSIONAL EXPERIENCE (continued)

1998 – 2011: **Field Operations Superintendent | Michels Directional Crossings | Brownsville, WI**

Responsible for coordinating and drilling directional boring projects for various size gas, water, sewer, electrical and communication lines as well as environmental wells. Duties include mobilization of all equipment and personnel to remote job sites throughout the United States and Canada; the set-up and drilling of crossings; on-site maintenance of mechanical and technical equipment; and necessary recordkeeping of plots and production. Oversees drilling survey during crossing.

1996 – 1998: **Pipe-Side Superintendent/Pullback Coordinator | Michels Directional Crossings | Brownsville , WI**

Lead person responsible for coordinating the pipe string-out and welding subcontractor located at the exit side of directional drill. Duties include overseeing of pipe string for pullback without delay, maintenance of equipment, material organization, and coordination of labor for specialized pipe coating and testing. Accountable for the critical path of having pipe prepared for pullback. Responsible for maintaining constant communication with Drilling Superintendent during pullback operation and coordinating efforts to pull the pipe in one well-balanced effort.

1995 – 1996: **Operator | Michels Directional Crossings | Brownsville, WI**

Crane operator responsible for safe operation and timely placement of drill stem and equipment. Integral link in the drilling operation, from drill rig set-up, pipe pull back and rig-down of equipment. Also conducted pipe support operations at the exit side during pipeline pullback. Responsible for permitting and mobilization/demobilization of heavy and non-dimensional equipment to drill sites.

1993 – 1995: **Skilled Laborer | Michels Directional Crossings | Brownsville, WI**

Specialized in mechanical repairs, land surveying, hydraulics, fluids, set-up and operation of drill motors, power generators, mud pumps, bentonite mixers, drill pipe, reamers, couplings and overall equipment maintenance and operation.

1987 – 1993: **United States Marine Corps | San Diego, CA**

EDUCATION

1987 **Winnebago Luthern Academy | Fond du Lac, WI**

High School Diploma

Randy Robinson

Midwest Operations Manager

PROFESSIONAL EXPERIENCE

2015 – Present: **Midwest Operations Manager | Michels Directional Crossings | Brownsville, WI**

Manage field crews on the installation of assigned pipeline projects. Specific duties include: material and supply coordinator, field liaison between engineering, estimating and subcontractors to ensure construction compliance, monitor work performance and craft productivity, enforce project quality, safety and environmental issues, regulation and resolution of field construction problems. Plan day-to-day operations onsite and line up the necessary resources to accomplish the plan. Work hand in hand with customers and third party inspection personnel to resolve issues.

2003 – 2015: **Superintendent | Michels Pipeline Construction | Lakeville, MN**

Supervises and assigns duties to directional drill rig crews installing plastic and steel pipelines. Generates daily work progress reports, trains new staff and orders materials and equipment necessary for overall success of the project. Prepares documents on cost, budget, contracts, estimates and other essential aspects of operations.

1993 – 2003: **Crew Foreman | Mueller Pipeline | New Berlin, WI**

Worked in the capacity of a foreman on pipeline related projects. Responsible for safety, schedule and budget of all assigned work. Directly managed crews performing distribution of gas, electric, telephone, and water directional drill instillation. Ensured conformance to specifications, drawings, procedures, and quality.

1987 – 1992: **Line Supervisor | McNeilus Truck & Manufacturing, Inc. | Dodge Center, MN**

1985 – 1987: **Laborer | Donaldson Construction | Dodge Center, MN**

1984 – 1985: **Forklift & Crane Operator | McNeilus Truck & Manufacturing, Inc. | Dodge Center, MN**

1982 – 1984: **Laborer | Steve Kutzler Family Farm | West Concord, MN**

EDUCATION

Marquette University | Milwaukee, WI

EUC Academy for Management

West Concord High School | West Concord, MN

High School Diploma

Kurt Myhre

Western Operations Manager

PROFESSIONAL EXPERIENCE

2020 – Present: **Western Operations Manager | Michels Directional Crossings | Brownsville, WI**

Supervisor of field operation superintendents and directional drilling project managers. Oversee large inventory of drilling tools and materials during storage and field use. Monitors production by Fleet Department of directional drilling personnel and equipment. Duties include coordinating and scheduling the mobilization of equipment, personnel and materials to remote job sites throughout the United States and Internationally. Involved in estimating of various directional drilling projects. Specialize in the engineering design, build and maintenance of directional drilling fleet. Responsible for pilot hole drilling & survey for complicated bores which include implementing and integrating new technology necessary for successful completion of leading edge HDD crossings (i.e. hole-intersects).

2017 – 2020: **Project Manager | Michels Directional Crossings | Brownsville, WI**

Responsible for coordinating directional boring projects for various size gas, water, sewer, electrical and communication lines throughout the United States and Canada. Complete knowledge of directional drilling technology and procedures. Duties include project coordination from start-up to completion, union relations, subcontractor coordination, production recordkeeping, and overall on-site management. Some more notable crossings include, but are not limited to:

Diameter	Length	Location	Year
20"	2236'	Lower Piney Creek, PA	2018
20"	2209'	Horse Valley Road, PA	2018
16"	1912'	Trough Creek Valley Pike/SR 829, PA	2018
20"	1720'	Everett RR-Juniata River, PA	2018
20"	1507'	Trough Creek Valley Pike/SR 829, PA	2018
16"	2346'	Frankstown Branch-Juniata River, PA	2018
20"	1337'	Berry Ridge & Old Mill Rd, PA	2018
20"	1260'	Hollow Road, PA	2017
20"	2307'	Frankstown Branch-Juniata River, PA	2017
20"	4771'	Raystown Lake, PA	2017
36"	7194'	Ohio River MP 16.07, OH/WV	2017

2015 – 2017: **Pipeline Major Maintenance Superintendent | Phillips 66 Pipeline, LLC | Billings, MT**

Supervisor for seven maintenance team members and lead on special projects. Managed the execution for all pipeline and field major maintenance work including the 6 year Division River Mitigation Program.

PROFESSIONAL EXPERIENCE (continued)

2014 – 2015: **Maintenance Craft Team Leader | Phillips 66 Refining | Borger, TX**

Supervisor for area maintenance team and lead on special projects.

2012 – 2014: **Pipeline Major Maintenance Coordinator | Phillips 66 Pipeline, LLC | Missoula, MT**

Provided coordination and oversight for all pipeline maintenance and construction projects for pipeline assets in Montana, Idaho and Washington.

1996 – 2011: **Construction Superintendent | Michels Pipeline (Formally Pilchuck Contractors, Inc.) | Kirkland, WA**

Held multiple positions ranging form laborer to superintendent. Expertise included construction of gas pipelines, phone, fiber optics and installations by directional drilling.

TRAINING & CERTIFICATIONS

- CPR/1st Aid and OSHA 10
- Operator Qualifications for Liquid & Gas Pipelines
- Competent Person Trench Safety Training
- Asbestos Inspector Level Certified
- CEPA Erosion Training
- FMCSA Supervisor Training
- FEMA ICS 100 through 400

EDUCATION

Central Washington University

Ray J. Viator

Marine Operations Manager

PROFESSIONAL EXPERIENCE

2002 – Present: **Marine Operations Manager | Michels Directional Crossings | Brownsville, WI**

Responsible for coordinating and drilling directional boring projects across the country. Duties include mobilization of all equipment and personnel to remote job sites: the set-up and drilling of crossings; on-site maintenance of mechanical and technical equipment: and necessary record-keeping of plots and production. Some more notable crossings include, but are not limited to:

Diameter	Length	Location	Year
12" Beach Offshore	1,500'	Old Harbour, Jamaica	2018
16" Beach Approach	1,508'	Beverly Harbor, MA	2015
16"	3,27'	Collins Cove, MA	2015
8" Water Approach	7,177'	Charleston, SC	2013
8" Land to Water	7,304'	Charleston, SC	2013
8" Land to Water	3,580'	Charleston, SC	2013
30" Water Exit	5,378'	Hudson River, NY	2012
12" Water to Water	1612'	WBC62, Cameron, LA	2011
36" Beach Approach	3492'	Trinidad/Tabago	2010
42” Land to Water	2208’	Guam	2008
32” Land to Water	1943’	Guam	2007
30” Land to Water	5668’	Trinidad	2006
24”	6183’	Corsicana, TX	2005
30”	2996’	Columbia, LA	2005
24” Beach Approach	3402’	Trinidad & Tobago	2005
12” Beach Approach	2714’	Hadera, Israel	2004
30” Beach Approach	2823’	Dor, Israel	2004
30” Beach Approach	2836’	North Redding, Israel	2004
30” Beach Approach	2728’	South Redding, Israel	2004
30” Water to Water	4300’	Georges Island, MA	2003
30” Water to Water	4631’	Beverly, MA	2003
30” Land to Water	4829’	Salem, MA	2003
30” Land to Water	3041’	Weymouth, MA	2003

1989 – 2001: **Operations Manager | Smit Land & Marine, Inc. | Houston, TX**

Provided pre-contract technical input and operational management of directionally drilled crossings. Contracts completed are briefly described below:

PROFESSIONAL EXPERIENCE (continued)

1985 – 1989: **Rig Superintendent | Smit Land & Marine, Inc. | Houston, TX**
Provided technical input and site supervision of all horizontal directional drilled crossings throughout the United States.

PROJECT PROFILES

Jacob Riis State Park; Construction of 5800’ of 12”steel water main pipe. (2001) – Rockaway, NY

City of Newport | Construction of a 24" HDPE x 2800' and a 20" HDPE with two 4” steel cable ducts x 2800’ crossing of Yaquinna Bay on the Pacific coast at Newport Oregon. The pipelines will be used for sewer/reclaimed water and fiber optic cables.; (2001) – Newport, OR

Georgetown County Water & Sewer District | Design and construction of a 10" HDPE x 4530' crossing of the Waccamaw River near Myrtle Beach South Carolina. The pipeline will be used for potable water supply to Sandy Island.; (2001)

AT&T (Concert Global Networks USA) | Construction of four 5” x 3000’ to 3600’ shore crossings drilled in rock and exiting in 35’ water depths on the Pacific coast of California at Manchester. The 5" dia. drill pipe will be used as a conduit for fiber optic cables linking the US with Japan.; (2000)

Daikin America | Design and construction of a 16" HDPE x 3000' shore crossing into the Tennessee River. The pipeline will be used as a NaCl/water outfall.; (2000) – Decatur, AL

City of Fort Lauderdale | Construction of a 24” x 1230’ steel water main and 7 No. 6” x 1220’ HDPE ducts crossing the Intracoastal Waterway.; (2000) – Fort Lauderdale, FL

City of Austin | Construction of two 24” steel water main crossings for the Davenport Ranch Water Supply Line Project in Austin, Texas: 1640’ Lake Austin (Colorado River) crossing and 1170’ FM 2222 crossing.; (2000)

Solutia | Construction of a 24" x 900' railroad and pipeline corridor crossing.; (1999) – Chocolate Bayou, TX

Exxon Pipeline Company | Construction of a 20" x 3830' shore crossing for the Hoover Offshore Oil Production System.; (1999) – Freeport, TX

Conoco, Inc. | Construction of a 10” x 4650’ crossing of the Old & Lost River Lake to replace an existing ethane line.; (1999) – Mont Belvieu, TX

Exxon Pipeline Company | Construction of the following crude and products pipelines for the “SOLA Project,” 24" x 2300' Mississippi River crossing, Dual 12” x 4300’ Mississippi River crossing, 24” x 4300’ Mississippi River crossing, Dual 12” + 24” x 1200’ Intracoastal Waterway cr; (1998) – Baton Rouge, LA

A.K. Steel | Design and construction of a 16" x 2350' crossing through rock, below Interstate 75 and a creek for gas distribution.; (1998) – Middletown, OH

Dauphin Island Gathering Partners | Design and construction of a 24" x 1800' shore crossing for gas distribution.; (1998) – Mobile Bay, AL

PROJECT PROFILES (continued)

Transco | Design and construction of a 30" x 4000' shore crossing for gas distribution and a 30” x 2800’ water-to-water crossing of Dauphin Island. Drilled from 7' of water to 22' of water.; (1998) – Mobile Bay, AL

Beaufort Jasper Water & Sewer Authority | Design and construction of a 28; (1998) – Hilton Head Island, SC

Amoco Trinidad Oil Company | Design and construction of a 12" x 4030' shore crossing for Trinidad LNG Project.; (1997) – Galeota Point, Trinidad

Dauphin Island Gathering Partners (OEDC) | Construction of a 24” x 4700’ water-to-water crossing. Drilled from 12' of water to 20' of water.; (1997) – Dauphin Island, AL

City of Charleston, CPW | Construction of a 30; (1997) – Charleston, SC

Mobil E & P | Design and construction of a 5" x 5200' and a dual 2" x 5200' water-to-water crossings of Little Dauphin Island and a bundled 6"+2-3"+2" x 900' shore approach in Aloe Bay.; (1996-1997) – Alabama

Texas Eastern Products Pipeline | Construction of an 8" x 5500' crossing of the Red River, an 8" x 570' crossing of the Old River and 2900' of 8" conventionally laid with two (2) valve sites and tie-ins.; (1996) – Louisiana

Shell Pipeline | Construction of a 20” x 4000’ crossing of the Mississippi River at Nairn from outside the flood protection levee.; (1996) – Louisiana

City of Savannah | Construction of a 30” x 5300’ crossing under Presidents Street, Savannah with a 28” HDPE pipeline within a 30” steel casing pipe.; (1996) – Savannah, GA

Dixie Pipeline | Construction of 10" x 2800' gas pipeline crossing the Atchafalaya River.; (1995) – Louisiana

Chevron Pipeline | Design and construction of a 12" x 3500' water-to-water crossing. Drilled from 21' of water to 12' of water.; (1995) – Dauphin Island, AL

City of Charleston, CPW | Construction of a 26” x 5280' crossing of the N. Cooper River with a 24” HDPE pipeline within a 26” steel casing pipe. Construction of a 26” x 5100' shore crossings into 30' of water from Fort Moultrie into Charleston Bay near Fort Sumter again with a 24; (1995) – Charleston, SC

AT&T | Construction of four (4) 5” x 4300’ shore crossings drilled in rock and exiting in 35’ water depths on the Pacific coast of Oregon at Bandon. The 5" dia. drill pipe will be used as a conduit for fiber optic cables linking the US with Japan (the TPC-5 pro; (1995)

Hampton Roads Sanitation District | Construction of five (5) river crossings: Pagan River 24” x 1300’; Bennetts Creek 36” x 1600’; Cypress Creek 30” x 1850’; Nansemond River 30” x 4750’; and Chuckatuck Creek 30” x 3100’.; (1994-1995) – Virginia

PROJECT PROFILES (continued)

Chevron Company USA | Construction of two shore approaches with bundled pipelines from Fourchon with exits in 13' of water: 10"+8" x 1560' and 2-8"+3" x 1350'.; (1994) – Louisiana

Exxon Company USA | Construction of a 12" x 3550' shore approach drilled from Grand Isle with an exit in 12' of water and pipe lay by the SubSea Constructor.; (1994) – Louisiana

Mobile Gas Service Corp. | Construction of a 12" x 2000' gas pipeline crossing of the Mobile River.; (1994) – Alabama

Dixie Pipeline | Construction of a 12" x 3500' gas pipeline crossing of the Amite River.; (1993) – Louisiana

Dixie Pipeline | Construction of a 12" x 2500' gas pipeline crossing of Baton Rouge Bayou in Baker.; (1993) – Louisiana

ARCO | Operational assistance to South East Asian office for the construction of a 26" x 3300' shore approach (drilled from land with pullback from the McDermott derrick / laybarge DB15) and a 26" x 4000' crossing in the open waters of the Java Sea. The 4000' c; (1993) – Jakarta, Indonesia

Chevron Pipeline | Construction of a 20" x 1600' crude oil pipeline replacement crossing of a ship channel in open waters in the approaches to Gulfport. Drilled from lift-boat barges and pullback from a laybarge in water depths of 20'.; (1992) – Mississippi

Corpoven | Construction of a 36" x 4450' pipeline crossing of the Rio Orinoco at Puerto Ordaz.; (1992) – Venezuela

BP Exploration | Construction of 3-12" pipeline bundle under Dauphin Island with a drilled length of 3900'. Drilled from self elevating platforms (lift-boats) and pullback from a laybarge in water depths of 14' and 20' respectively.; (1991) – Alabama

Lagoven | Installation of a 36" x 3300' pipeline crossing of the Rio Morichal Largo on the "orimulsion" trunkline project.; (1991) – Venezuela

Lagoven | Construction of a 36" x 1700' pipeline crossing of the Rio Tigre as part of the "orimulsion" project.; (1991) – Venezuela

Shell Pipeline | Construction of a 4" x 3500' crossing of the Saginaw River in Bay City.; (1991) – Michigan

Columbia Gas | Installation of two 20" diameter pipeline river crossings - Mantua Creek (1650') and Raccoon Creek (1550').; (1990) – New Jersey

Sun Pipeline | Replacement of an 8" x 2200' gas pipeline by drilling through rock on hillside.; (1990) – Ohio

Shell Pipeline | Construction of a 10" x 1500' crossing of the Kawkawlin River.; (1990) – Michigan

Amoco Gas | Construction of a 16" x 3900' crossing of Wolf Creek in Dollar Bay, Texas City.; (1990) – Texas

PROJECT PROFILES (continued)

City of Norfolk | Construction of a 20" x 1600' water pipeline crossing of the Elizabeth River in Norfolk.; (1990) – Norfolk, VA

Seagull | Installation of two beach crossings (drilled from land) and two water-to-water crossings (drilled from spud barges) for a 1-10" and 3-8" pipeline bundle across the Houston Ship Channel at Baytown. The pipelines were pulled from a shallow draft laybarge. ; (1990) – Texas

Dixie Pipe Line | Construction of a 12" x 3000' emergency replacement crossing of the Tangipahoa River at Zachary.; (1990) – Louisiana

City of Chesapeake | Construction of a 24" x 1600' water pipeline crossing of the Elizabeth River at Chesapeake.; (1990) – Chesapeake, VA

Dixie Pipe Line | Installation of a 12" x 2300' crossing of the Comite River at Baton Rouge.; (1990) – Louisiana

Phillips Petroleum | Construction of two 12" diameter crossings near Houston: a 700' crossing of the Brazos River and a similar length crossing of Clear Creek.; (1990) – Texas

ARKLA | Installation of two 12" crossings near Fort Coffee: 2000' at the Arkansas River and 950' at the Poteau River.; (1990) – Oklahoma

Texas Power | Construction of three 16" crossings at Freeport as part of Wacker Oil's offshore development: 1600' Ship Channel crossing, 2300' Intracoastal Waterway crossing and 2700' shore approach.; (1989) – Texas

Transco | Installation of two 20" diameter crossings at Corpus Christi: an 1800' highway crossing and a 2000' lagoon crossing.; (1989) – Texas

Dixie Pipeline | Installation of a 12" x 1800' crossing of the Pearl River near Columbia.; (1989) – Mississippi

Union Camp | Construction of two Savannah River crossings: 42" x 1850' and 10"+6" bundle x 1850'.; (1989) – Georgia

Contel | Construction of a 5" x 750' crossing of the Altamaha River crossing near Jessup.; (1989) – Georgia

Phillips Petroleum | Installation of a 20" x 1800' crossing of the Brazos River at Freeport.; (1989) – Texas

Phillips Petroleum | Construction of two 2300' crossings of the Osage River at Jefferson City for 12" and 6" pipelines.; (1989) – Missouri

AT&T | Installation of five crossings with 5" conduit between Little Rock and Tulsa: Little Maumelle River - 1100' and 650', Fourche La Fave River - 550', Arkansas River - 2000' and Petit Jean River - 550'.; (1989) – Arkansas & Oklahoma

Paul Krings

Senior Equipment and Logistics Manager

PROFESSIONAL EXPERIENCE

2019 – Present: **Senior Equipment and Logistics Manager | Michels Directional Crossings | Brownsville, WI**

Strategically manage operations in overseeing the coordinating of equipment and personnel to project jobsites. Plan, direct, coordinate purchasing, distribution and forecasting of daily operations. Oversee equipment repair and building of new, inventory control, material handling, customer service, coordinate transportation and hiring of employees. Ensures that project milestones/goals are met and adhering to approved budgets.

Provides direct supervision to supervisors and field personnel in daily operational activities, maintains regular on-site contact to assure services being performed are within Company guidelines and in accordance with consumer specifications.

Reviews daily reports and time tickets to determine hours worked, mechanical problems, etc. to effectively plan and schedule daily operational activities.

Ensures routine and preventative maintenance and repairs to keep all equipment in optimum operating condition, thus minimizing down time.

1996 – 2019: **Field Operations Superintendent | Michels Directional Crossings | Brownsville, WI**

Responsible for coordinating and drilling directional boring projects for various size gas, water, sewer, electrical and communication lines. Duties include mobilization of all equipment and personnel to remote job sites throughout the United States; the set-up and drilling of crossings; on-site maintenance of mechanical and technical equipment; and necessary record keeping of plots and production.

Skilled equipment operator with the operation of technical, lifting and heavy equipment for directional drilling operations. Working knowledge of hydraulic engineering and applied mechanical engineering. Skilled in hydraulics repair, electrical repair, welding and troubleshooting. Working knowledge of computers and downhole survey along with surveying and surveying instrumentation.

Some more notable crossings include, but are not limited to:

MICHELS®

Jason Pedersen, CSM

Safety Director

PROFESSIONAL EXPERIENCE

2017 – Present: **Safety Director | Michels Corporation | Brownsville, WI**

The primary function of the HSE Director is to work within corporate strategies and policy frameworks to design, implement and direct safety programs, guidelines and procedures. This position provides personal leadership and sets an example of following all safe work practices and procedures. Regularly interfaces with Senior Management, peers, subordinates and client personnel, overseeing project site HSE plans and alliance with corporate values, requirements and initiatives.

The primary responsibility is to coordinate the company's safety activities including:

- Develop procedures and lead the implementation of processes which have been established to ensure compliance with applicable standards, requirements and identified practices. Ensure Michels Corporation has effective programs to protect the safety of employees and comply with or exceed regulations through personal observation, HSE Manager review and audits.
- Demonstrate leadership by giving clear, complete, and accurate information on HSE requirements, process standards, potential health and safety hazards, and potential process difficulties. Interface with operations providing leadership and coaching to facilitate continuous HSE performance improvement.
- Participate in incident/injury investigations, including on-site presence, preparation of reports, analysis and exhibits. Identify regulatory and civil parties needing involvement.
- Work with all employees to instill a safe and environmentally conscientious work environment, determining the awareness level, discussing policies and procedures, advising on the best means of following those policies and procedures and coaching to improve behavior as needed.
- Recommend, implement, and manage safety devices, equipment, and/or products that help protect employees and customers and mitigate losses.
- Work closely with Operations, Quality Assurance, HR, Risk, and various other departments to enhance HSE systems. Communicate HSE information to key management as directed.

2013 – 2017: **HSE – Senior Manager, Compliance Specialist | Michels Pipeline Construction | Brownsville, WI**

Manage the HSE Team. Carry out supervisory responsibilities in accordance with the organization's policies and applicable laws. Responsibilities include interviewing, hiring, and training employees; planning, assigning, and directing work; providing feedback; rewarding and disciplining employees; addressing complaints and resolving problems. Identify and leverage HSE best practices across divisions. Maintain open communication with divisional and department leads to ensure coordination of HSE needs. Advises HSE Director on Health, Safety, and Environmental-related matters throughout the corporation. Review project safety requirements prior to bid and advise division on site specific training or equipment that may be needed. Is present at or delegates to HSE Coordinators to be present during regulatory site visits. Assist with and participate in client sales presentations and formal client meetings. Represent Michels at conferences, committees, and customer meetings. Work with Information Systems and Technology to identify and implement tools to drive better communication, process-management, and reporting tools. Other duties as assigned.

2014 – 2016: **Project Manager | Michels Corporation | New York, NY**

Responsible for contract management and project coordination, including personnel and material, cost and budget control, tracking progress and schedule, submission of proper submittals and support engineering, and review of daily field reports. Serving as the point of contact for the project and maintaining communication with clients, general/subcontractors, vendors, and suppliers.

2011 – 2016: **HSE-Safety Coordinator | Michels Corporation | New York, NY**

Development and implementation of on-site procedure, emergency response plan, on-site safety inspections, equipment inspections and reporting to supervisors. Assigned the responsibility for coordinating and maintaining the company safety program. Advises management in matters of safety and health, and monitors day-to-day operations to ensure that the company's safety policies and procedures are followed.

2007 – 2011: **Project/Field Engineer | Michels Tunneling | New Berlin, WI**

Holds responsibility for coordination of all technical activities on assigned projects. Plans, schedules, conducts, and coordinates assigned engineering work; monitors work for compliance to applicable codes, accepted engineering practices, and ensures effective communication and coordination on assigned projects between all disciplines and all other project participants.

PROJECT PROFILES

MED609 – 62nd St. Tunnel Project; 620 LF of 76" Hard Rock Tunnel using a Robbins TBM. Included pipe jacking operations of 72" Casing pipe for a new water main. Construction in Manhattan – New York City. – New York, NY

East Side Access Tunnel – Contract CM005; interior structures, interior structures, and fit-out for caverns and tunnels beneath the existing Grand Central Terminal in Manhattan. Work included installation of piping/drainage systems, embedded conduits & ground mesh, waterproofing membrane & contact grout pipes, >9 million pounds of rebar, and placement of >70,000 cubic yards of concrete & wet/dry mix shotcrete. – New York, NY

Novartis Institute | Campus Expansion Project at 181 Massachusetts Ave.; Construct a 72" dia. steel Utility Tunnel by Microtunneling one run by jacking a 72" dia. Permalok steel casing pipe for a total of 120'. Jacking from a new building foundation excavation to and existing parking garage basement. – Cambridge, MA

University of Massachusetts | Central Campus Infrastructure; Construct a Jacking Shaft 30' diameter by 40' deep. Microtunnel two runs by jacking 48" dia. Permalok steel casing pipe for a total of 950'. Install 24" dia. PVC carrier pipe inside the casing pipe and gill the annulus with grout. – Amherst, MA

PROJECT PROFILES (continued)

City of Milwaukee | 26th Street Combined Sewer Sliplining; 4,500 LF of slip lining a 126” diameter Hobas pipe inside an existing 144” combined sewer concrete pipe. Included excavation of 2 access shafts (approx. 80’ deep) using rib and lagging construction methods to lower the Hobas pipe into the existing tunnel. – Milwaukee, WI

San Francisco Public Utilities Commission | Bay Division Pipeline Reliability Upgrade, Bay Tunnel; 26,208 LF of 12’ – 10” diameter concrete segmented tunnel under the San Francisco Bay from Menlo Park on the S.F. Peninsula Bay to Newark in the East Bay area, two slurry diaphragm wall shafts, and 108” cement motor lined steel pipe welded in the tunnel and shafts as a final liner carrier pipe. – San Francisco, CA

Massillon Road Sanitary Sewer Improvement; 2,925 LF of 42” Centrifugally Cast Fiberglass Reinforced Polymer Mortar Pipe sanitary sewer gravity sewer, microtunnel installation; 1,328 LF of 48” CCFRPM pipe on micropile support, 29 LF of 36” OH CCFRPM pipe, gravity sewer, micropile support. 7 EA shaft excavations with steel sheeted ground and 7 EA manholes structures. 250 LF of open cut excavation with steel sheeted ground support. – Akron, OH

Brazos River Authority East Williamson County Regional Water System Contract A; Raw Water Intake Pump Station; Two 60-inch Raw Water Intake Pipelines by Microtunnel Construction; 303 LF – Austin, TX

Galveston Causeway; Two 700’ tunnel drives through clay underneath Galveston Bay. 48” Permalok. – Galveston, TX

OCI Project No. DB10-WASD-01 ESP; 1,200 LF of 72” Permalok steel casing under the Government Cut Channel – Miami, FL

Fairfax Department of Public Works & Environmental Services | Dogue Creek Force Main Replacement; Dogue Creek Force Main Replacement – Fairfax County, VA 4,200 LF of 74” dia. Microtunnel between 6 drop shafts and tied into the existing pump station and out fall structures in order to replace an existing sewer. The majority of work performed on and coordinated with the Army Military Base – Fort Belvoir. – Fairfax County, VA

Milwaukee Metropolitan Sewer District | South 43rd Street Relief Sewer; Installation of 4500 LF of RCP using both a Akkerman MTBM slurry machine and Iseki MTBM slurry machine and 2000 LF of RCP using a Decker TBM with Direct Pipe Jacking. Job alsoconsisted of sheet pile shafts and rib and lagging/liner plate shafts at 15 structure locations. – Milwaukee, WI

Milwaukee Metropolitan Sewer District | Canal St. Wet Weather Relief Sewer; Installation of 6,000 LF RCP of Direct Pipe Jack using a 105” Lovat EPB TBM with Direct Pipe Jacking. Job also consisted of sheet pile shafts and rib and lagging/liner plate shafts at 18 structure locations. – Milwaukee, WI

Sacramento Regional County Sanitation District | Upper Northwest Interceptor Sewer 3 & 4; Installation of 3,000 LF of RCP using an 84” Akkerman MTBM slurry machine, 8,000 LF RCP Two-Pass Tunnel using a 130” Lovat TBM, and 6,000 LF RCP of Direct Pipe Jack using a 105” Lovat EPB TBM. Job also consisted of 12 sheet pile shafts and 6 drilled manhole shafts. – Sacramento, CA

TRAINING & CERTIFICATIONS

- OSHA 30-Hour
- OSHA 10-Hour
- OSHA 500 – Trainer Course for Construction (Qualified To train 10 to 30 Hour Classes)

TRAINING & CERTIFICATIONS (continued)

- BioMarine BioPak Re-breather Training and Certification
- Cal/OSHA Certified Gas Tester
- Cal/OSHA Licensed Tunnel Safety Representative
- Certified Associate Constructor - American Institute of Constructors (AIC)
- American HealthCare Assoc. Healthcare Provider Certification
- American HealthCare Assoc. Heartsaver First Aid Certification
- Rigging and Fall Protection Inspection Training (Competent Person)
- Medic First Aid Certification Renewal (CPR, AED, & First Aid)
- Qualified Rigger and Signal Person
- Confined Space Entry Awareness Training (Competent Person)
- Open Trench Safety Awareness Training (Competent Person)
- Wisconsin Lift Truck Operator Training
- Commercial Driver's License (Class ABC)
- 32-Hour Supported Scaffold Certified (NYC-DOB)
- Louisiana State Licensing Board for Contractors -- Pipe Work: 7-43 (Sewer Lines) 7-44 (Storm Drains) 7-45 (Water Lines) #25444
- Louisiana State Licensing Board for Contractors -- Specialty: 7-590 Telecommunications #25444
- North Carolina Licensing Board for General Contractors -- S (Boring & Tunneling) #29269
- State of Rhode Island: Contractors' Registration and Licensing Board -- Commercial & Residential Contractor Registration #40432
- South Carolina Department of Labor, Licensing and Regulation -- Class WL5 (water lines) & BT5 (bore & tunnel) #G10861

INDUSTRY INVOLVEMENT

- 2009 National AGG/ASC Heavy Civil Construction Competition – 4th Place
- 2008 Great Lakes Region AGG/ASC Heavy Civil Construction Competition – 1st Place
- 2007 Great Lakes Region AGG/ASC Heavy Civil Construction Competition – 3rd Place
- 2006 Lynn E. Legault Undergraduate Scholarship (AGC Education Research Foundation)

EDUCATION

University of Wisconsin–Stout | Menomonie, WI

Bachelors of Science – Construction; Minor – Risk Control & Business

University of Wisconsin–Fond du Lac | Fond du Lac, WI

Associates of Arts & Science Degree

Richard Zavitz

Drilling Fluids Specialist/Project Manager

PROFESSIONAL EXPERIENCE

2012 – Present: **Drilling Fluids Specialist/Project Manager | Michels Directional Crossings | Brownsville, WI**

Develop detailed drilling fluid plans and contingencies based upon geotechnical reports, equipment and scope of project. Measure and testing of drilling fluids and supervising the mixing and pumping operations. Perform technical analysis and interpret geotechnical reports. Control and maintain drilling fluids parameters and provide technical recommendations. More notable crossings include, but are not limited to:

2011 – 2012: **Drilling Fluid Specialist | Mears Group, Inc. | Billings, MT**

Developed detailed drilling fluid plans and contingencies based upon geotechnical reports, available equipment and scope of project. Selected bentonite and polymers based on characteristics required by the project. Trained field personnel on mud testing concepts and drilling fluid theology. Liaised with environmental regulators to obtain approval for drilling fluid products for projects.

2010 – 2011: **Territory Manager | Akkerman, Inc. | Billings, MT**

Sold tunneling and pipe jacking equipment. Analyzed and interpreted geotechnical reports to provide equipment recommendations.

2000 – 2010: **Technical Sales Engineer | Wyo-Ben, Inc. | Billings, MT**

Engineered fluids on HDD, microtunneling, pipe ramming, pipe jacking and auger boring projects. Analyzed geotechnical reports and developed mud/lubrication programs.

1998 – 2000: **Sales Representative | Surface to Surface | London, Ontario, Canada**

Trained new HDD operators. Sold pipe and cable locating equipment.

Colorado School of Mines

Taught bentonite and polymer course at Microtunneling Short Course.

TRAINING & CERTIFICATIONS

- OSHA 510 - OSHA Standards for Construction
- Apprenticed under oil field qualified mud engineer working on HDD projects
- OSHA 10-Hour
- Multiple OQ courses for various energy companies
- Multiple safety courses required by various energy companies
- OFITE trained in repair and calibration of OFITE Model 900 viscometer

EDUCATION

1988 **University of Western Ontario**

Bachelor of Arts, Kinesiology

2000 **Wyo-Ben, Inc. Intensive Mud School**

Graduated

1994 – 2002: **Project Manager**

Michels Mid-America Line and Cable | Brownsville, WI

Job estimating, profit and loss coordination of materials and equipment. Labor and production jobs varying in size up to $25 million. Projects include aerial, buried, underground, cooper and fiber routes.

1987 – 1991: **Project Manager**

U.S. Sprint | Midwest and Eastern U.S.A.

Responsible for construction management, permits, schedules and daily work operation to meet completion dates. Jobs varying in size to $20 million.

1985 – 1986: **Senior Engineer**

U.S. Sprint | Midwest and Eastern U.S.A.

In charge of engineering and fiber construction for several miles.

1981 – 1984: **Construction and Maintenance Supervisor**

United Telephone of Florida | Fort Meyers, FL

Responsibilities include new construction, maintenance, splicing and cutover of offices in eight exchanges. Responsible for daily operation of 35 splicers.

1964 – 1980: **Cable Splicer**

United Telephone of Florida | Fort Meyers, FL

Spliced paper and plastic cable, exchange cutover and maintenance of all types of cable.

1962 – 1963: **Lineman**

United Telephone of Florida | Fort Meyers, FL

Worked on open wire circuits including toll circuits and placements of cable.

EDUCATION

1956 **Hardee High School | Wauchula, FL**

High School Diploma

Jeremiah Yliniemi

Project Manager

PROFESSIONAL EXPERIENCE

2020 – Present: **Project Manager | Michels Directional Crossings | Brownsville, Wisconsin**

Responsible for coordinating directional boring projects for various size gas, water, sewer, electrical and communication lines throughout the United States and Canada. Complete knowledge of directional drilling technology and procedures. Duties include project coordination from start-up to completion, union relations, subcontractor coordination, production record-keeping, and overall on-site management. Some more notable crossings include, but are not limited to:

Diameter	Length	Crossing/Location	Year
16"	4813'	Raystown Lake, PA	2020

2006 – 2020: **Field Operations Superintendent | Michels Directional Crossings | Brownsville, WI**

Responsible for coordinating and drilling directional boring projects for various size gas, water, sewer, electrical and communication lines. Duties include mobilization of all equipment and personnel to remote job sites throughout the United States; the set-up and drilling of crossings; on-site maintenance of mechanical and technical equipment; and necessary record keeping of plots and production. Skilled equipment operator with the operation of technical, lifting and heavy equipment for directional drilling operations. Working knowledge of hydraulic engineering and applied mechanical engineering. Skilled in hydraulics repair, electrical repair, welding and troubleshooting. Working knowledge of computers and downhole survey along with surveying and surveying instrumentation. Some more notable crossings include, but are not limited to:

2019: **HDD Operator | Michels Directional Crossings | Brownsville, Wisconsin**

Responsible for coordinating and drilling directional boring projects for various size gas, water, sewer, electrical and communication lines as well as environmental wells. Duties include mobilization of all equipment and personnel to remote job sites throughout the United States; the set-up and drilling of crossings; on-site maintenance of mechanical and technical equipment; and necessary recordkeeping of plots and production.

2017 – 2019: **Skilled Laborer | Michels Directional Crossings | Brownsville, Wisconsin**

Integral member of a specialized team working on and around directional drilling rigs. Multi-capable to assist with all facets of drilling operations. Familiar with mechanical repairs, hydraulics, fluids, set-up and operation of drill motors, power generators, mud pumps, bentonite mixers, drill pipe, reamers, couplings and overall equipment maintenance and operation.

2004 – 2017: **Bore Coordinator, Project Manager, Construction Inspection & Water Treatment Operator | Xenia Rural Water District | Bouton, IA**

Coordinated the projects from mapping the project to scheduling of utility locations and equipment. Worked with the state, county and local officials for the projects and acquired DOT permits. Attended landowners meetings/conflict management, completed daily project reports and reported to the executive director. Installation of water lines 1" to 24" PVC, fusible PVC and HDPE and 8" to 36" steel. Operation of multiple pieces of equipment (bore machines, ditch witch, backhoes, track hoes and dozers).

TRAINING & CERTIFICATIONS

- Water Treatment and Distribution Grade II Certification
- Vocational Auto Mechanics

2005 – 2008: **Laborer | Ballard Utility**

Run Directional Drills

2001 – 2005: **Laborer | NPL**

Installed gas services and mains by Directional Drilling

1994 – 2000: **Operator | Mears Directional Drilling**

Worked as a laborer, became an operator for an excavator and final advancement operating a 24-40 drill rig.

MICHELS®

Doug Stebbins

Field Operations Superintendent

PROFESSIONAL EXPERIENCE

2018 – Present: **Field Operations Superintendent | Michels Directional Crossings | Brownsville, Wisconsin**

Responsible for coordinating and drilling directional boring projects for various size gas, water, sewer, electrical and communication lines. Duties include mobilization of all equipment and personnel to remote job sites throughout the United States; the set-up and drilling of crossings; on-site maintenance of mechanical and technical equipment; and necessary record keeping of plots and production. More notable crossings include, but are not limited to:

Diameter	Length	Location	Year
42"	3451'	Bow River, Cananda	2019
24"	3183'	Crow River, MN	2019
20"	1010'	East Branch Escanaba River, MI	2019
20"	6429'	Badlands Canyon, MT	2019
20"	1421'	Middle Branch Escanaba River, MI	2019
24"	6336'	Mississippi River, IL/MO	2019
20"	2355'	Joanna Rd, PA	2018
36"	2611'	Tuscarawas River MP 47.8, OH	2018
42"	3980'	Susquehanna River MP 99.6, PA	2018
42"	1810'	Interstate 80, PA	2018

2007 – 2017: **HDD Operator | Michels Corporation | Brownsville, wi**

Skilled equipment operator with the operation of technical, lifting and heavy equipment for directional drilling operations. Working knowledge of hydraulic engineering and applied mechanical engineering. Skilled in hydraulics repair, electrical repair, welding and troubleshooting. Working knowledge of computers and down hole survey along with surveying and surveying instrumentation. Responsible for surveying, staking and design of directional drill path and curve, drilling the pilot hole, monitoring the drill path and calculating and interpreting the ground elevations and contours. Complete surveying skills and experience utilizing a Total Station (Theodolite with built-in EDM) for lay out of grade elevations over all types of topography in establishing alignment tying into existing surveyed points (benchmarks). On-site maintenance of technical equipment, and necessary record-keeping of plots and drilling logs. Some more notable crossings include, but are not limited to:

PROFESSIONAL EXPERIENCE (continued)

1996 – 1997: **Fluid Dynamics Technician | Michels Directional Crossings | Brownsville, WI**

Accountable for mixing bentonite solution used throughout directional drilling and reaming operations. Trained to monitor viscosity of mixture and manipulate ratios of solids and fluid to maintain specific viscosities which continually change based on the environment and which vary by operation phases and subterrain. Experience in operation, maintenance and repair of bentonite mixing equipment.

EDUCATION

1996 **University of Wisconsin-Madison | Madison, WI**

1995 **Goodrich High School | Fond du Lac, WI**

High School Diploma

MICHELS®

Lorenzo Rivera Jr

Drilling Survey Technician

PROFESSIONAL EXPERIENCE

2017 – Present: **Drilling Survey Technician | Michels Directional Crossings | Brownsville, Wisconsin**

Responsible for surveying, staking and design of directional drill/Direct Pipe path and curve, drilling the pilot hole, tracking and monitoring the drill path and calculating and interpreting the ground elevations and contours. Computer literate with knowledge and experience operating various software including: 1) Magnetic Guidance System, 2) Survey, 3) Tru-Tracker and 4) Microsoft applications. Applied working knowledge of advanced mathematics including: 1) Fluid Dynamics, 2) Advanced Algebra, 3) Trigonometry, 4) Calculus, 5) Statistics and 6) Stress Engineering. Complete surveying skills and experience utilizing a Total Station (Theodolite with built-in EDM) for lay out of grade elevations over all types of topography in establishing alignment tying into existing surveyed points (benchmarks). Additional duties include on-site maintenance of technical equipment, and necessary record-keeping of plots and drilling logs. Performed the above operations for crossings which include, but not limited to:

Diameter	Length	Crossing/Location	Year
16"	7595'	Houston Ship Channel, TX	2019
24"	3183'	Crow River, MN	2019
20"	1421'	Middle Branch Escanaba River, MI	2019
16"	3628'	Eagleview Blvd, PA	2019
42"	2007'	Las Moras Creek, TX	2019
20"	2236'	Lower Piney Creek, PA	2018
42"	4687'	Lake Scranton Finished H2O Tunnel, PA	2018
36"	1863'	E Branch Black River MP 86.7, OH	2018
48"	651'	Juniata River, PA - HK750PT Installation	2018
36"	1682'	W Branch Black River MP 92.3, OH	2018
42"	1861'	San Martin Lake Channel, TX	2018
42"	899'	Highway 50, West Virginia - HK500PT Installation	2018
36"	1535'	Calumet River, IL - HK300PT Installation	2017
48"	2183'	Resaca De Los Fresnos Canal #2, TX	2017
48"	2555'	Resaca De Los Fresnos Canal #1, TX	2017
48"	2126'	Pinson Rd Canal, TX	2017
48"	2042'	County Rd 300 Canal, TX	2017
48"	2398'	CR2340 & Los Olmos Creek, TX	2017
48"	2349'	Chiltipan Creek, TX	2017

PROFESSIONAL EXPERIENCE (continued)

2013 – 2017: Operaor/Direct Pipe | Michels Directional Crossings | Brownsville, WI

Skilled equipment operator with the operation of technical, lifting and heavy equipment for direct pipe & directional micro-tunnel operations as well as directional drilling operations. Working knowledge of hydraulic engineering and applied mechanical engineering. Skilled in hydraulics repair, electrical repair, welding and troubleshooting. Working knowledge of computers and downhole survey along with surveying and surveying instrumentation. Some more notable crossings include, but are not limited to:

DIRECT PIPE INSTALLATIONS/PIPE ASSISTS

Diameter	Length	Crossing/Location	Year
36"	827'	Leslie Street, Ontario, Canada - HK 300PT Installation	2015
48"	4,039'	Dow Barge Channel, Clute TX - HK750PT Installation	2015
36"	1,002'	Hwy 225, Deer Park, TX - HK300PT Installation	2015
36"	1,092'	Lubrizol Drainage, LaPorte, TX-HK300PT Installation	2015
48"	2,455	Rio Grande River, El Refugio, TX-HK750PT Installation	2014

Additional duties include on-site maintenance of technical equipment, and necessary record-keeping of plots and drilling logs.

Some more notable crossings include, but are not limited to:

Diameter	Length	Crossing/Location	Year
16"	2518'	Herman O.W. Drive, PA, PA	2019

2018 – 2019: **HDD Operator | Michels Directional Crossings | Brownsville, Wisconsin**

Skilled equipment operator with the operation of technical, lifting and heavy equipment for directional drilling operations. Working knowledge of hydraulic engineering and applied mechanical engineering. Skilled in hydraulics repair, electrical repair, welding and troubleshooting. Working knowledge of computers and down hole survey along with surveying and surveying instrumentation.

2017 – 2018: **Skilled Laborer | Michels Directional Crossings | Brownsville, Wisconsin**

Integral member of a specialized team working on and around directional drilling rigs. Multi-capable to assist with all facets of drilling operations. Familiar with mechanical repairs, hydraulics, fluids, set-up and operation of drill motors, power generators, mud pumps, bentonite mixers, drill pipe, reamers, couplings and overall equipment maintenance and operation.

2013 – 2015: **CNC Lathe Operator | D&S Machine Service Inc. | Luxemburg**

Operated a CNC lathe machine to precise dimensions per interpretation of blue prints, prioritize the tasks at hand for the day & operated a forklift.

PROFESSIONAL EXPERIENCE (continued)

2003 – 2006: **Drilling Survey Technician | Southeast Pipeline Construction | Casa Grande, AZ**

All aspects of drilling and design utilizing Tru-Tracker software for contractor. Larger projects include:

Diameter	Length	Location/Customer
56" (3)	2100'-2520'	Bechtel/API
16" (9)	800'-3400'	Williston Basin
36"	1185'	Snelson Hoen Rd
24"	3385'	Carbon Mountain

2003: **Drilling Survey Technician | H.M.S. Construction | Rio Vista, CA**

All aspects of drilling and design utilizing Tru-Tracker software for contractor. Larger projects include:

Diameter	Length	Location/Customer
8" & 12"	450'	City of Waikiki, HI
HDPE	615'-1005' (6)	U.S. Navey Aloha-Aina Park
32"	2900'	AP & T Tidal Inlet

2002 – 2003: **Drilling Survey Technician | Thunderbird Exploration | Gilbert, AZ**

Steering hand working on communication projects. Larger projects include:

Diameter	Length	Location/Customer
8"	Various	Telecommunications
8" & 10"	600'-2400'	U.W. I.
24"	800'-1200'	Questar

1998 – 2002: **Drilling Survey Technician | Ozzie's Directional Drilling | Scottsdale, AZ**

EDUCATION

1980 **Soper High School | Soper, OK**

High School Diploma

Performance Indicators

Performance Measure	Target/Achievements
Lagging Indicators:	
Total # of Incidents	Should demonstrate that employees understand what is considered an incident and are appropriately reporting with an emphasis on **Near-Hit reporting**
Incident Severity Totals (near hit, minor, serious, major, critical)	1 Near Hit/Learning Event : 2,500 hours worked
Recordable Injury Related Incidents	No medical aid incidents
Total Exposure Hours	Contractor and Subcontractor total hours.
Total Spills/Releases	Demonstrates employee's knowledge of spill/release definition and the proper methods to use clean-up kits that are provided to all employees/jobs
Recordable Vehicle Incidents	No reportable vehicle incidents
Total Exposure Miles	For contractor and subcontractor
Leading Indicators	
Total # of Tailgate Meetings	Held Daily
Total # of Weekly Safety Meetings	Held Weekly
Total # Monthly Safety Meetings (Project Team)	Held Monthly
Total # of JSAs reviewed for quality assurance	# of JSAs developed and # reviewed
Total # of Safety Stand downs	List and Why they were held
Total # of Formal Inspections	When and Conducted by Whom
Total # Safety Meetings (Michels)	(as per Michels Site Specific Safety Plan (SSSP) • Monthly Safety meeting • Weekly / Shift Safety Meeting • Daily Tailgate Meeting • Total # of Safety Meetings per month
Work Site Inspection – formalized / documented (as per Contractor)	**(**Daily – Safety Inspector) (1 with Project Manager / construction manager) (2 with HSE Representative)
Michels Response to audit/inspection findings or any HSE related issues	Demonstration that Michels takes safety related issues seriously and implements effective controls in a timely manner to ensure a safe work site

JOB SAFETY ANALYSIS

PURPOSE:

A Job Safety Analysis (JSA) is a tool used to identify/recognize potential hazards at your work location, and to help implement solutions or correct actions to reduce or eliminate the hazard prior to the start of work to allow for a safe working environment.

ASSESS ***IDENTIFY*** ***CONTROL***

HAZARDS IDENTIFIED MAY INCLUDE BUT ARE NOT LIMITED TO:

1. Trip Hazards—Timber mats, rough terrain, etc.
2. Existing Utilities—Overhead/Underground
3. Pinch Points—Moving equipment/material
4. Slips & Trips—Slippery /obstructed work surfaces
5. Falls—Working at heights (6ft. or greater)
6. Excavations—Soil failure
7. Environmental—Excessive mud, water, dust, etc.
8. Chemicals—Hazardous substances
9. Wildlife—Venomous snakes & spiders
10. Plants—Poisonous plants

JOB SAFETY ANALYSIS WORK SHEET

Tasks to be performed/critical steps to be taken (Check all that apply to job)	Potential Hazard (Check all that apply to tasks/steps from column 1)	Recommended Safe Job Procedures (Check all protective measures that apply to what was identified in column 2)	
☐ Driving	☐ Traffic hazards (vehicular & pedestrian)	☐ Designate a person for a specific task such as confined space attendant, fire watch, etc.	☐ Keep guards in place at all times – no modifications to tools or equipment
☐ Walking	☐ Working on rough/challenging/uneven terrain	☐ Hold a pre job meeting with all involved	☐ Use hearing protection
☐ Manual Digging	☐ Exposure to loud noise	☐ Utilize one call and pothole/daylight existing utilities BEFORE excavating	☐ Know the depth of water and stay out of it
☐ Mechanical Digging	☐ Overhead Utilities / Underground Utilities	☐ Inspect excavations & complete report	☐ Yield for pedestrians & equipment
☐ Manual Lifting	☐ Suspended Loads / Swinging Loads	☐ Barricade or mark areas of excavation	☐ Reduce speed and drive defensively
☐ Mechanical Lifting (Crane)	☐ Heavy Objects/ Back Injuries	☐ Utilize protective systems (shoring/sloping)	☐ Use of additional PPE (face shield, goggles, chaps etc.)
☐ Welding /Cutting/Grinding	☐ Heavy Lifting Equipment	☐ Nobody permitted to enter unsafe excavations (ensure access/egress is provided)	☐ Inspection and color coding of electrical tools
☐ Hauling Equipment/Materials	☐ Heavy Earthmoving Equipment	☐ Walk with small steps, take time & watch footing	☐ Inspect tools for signs of excessive wear/damage & replace if necessary
☐ Setting/Moving Timbers/Mats	☐ Trenches/Excavations (Engulfment/collapse)	☐ Never park a vehicle next to heavy equipment	☐ Stay clear of x-ray operations
☐ Coating	☐ Asphyxiation / confined space hazards	☐ Wear appropriate PPE at all times	☐ Install portable lighting in dark areas
☐ Sandblasting	☐ Slips, trips & falls – rough/slippery working surfaces	☐ Use taglines where appropriate	☐ Use bug spray or other means of pest control
☐ Rigging	☐ Possible hit/struck/crushed by moving trucks or equipment	☐ Stay a minimum of 25 ft. from loads and equipment	☐ Store cylinders upright, secured with the caps on and transport properly
☐ Line-ups	☐ Slings, Cables, Chains could break/fail	☐ Use proper lifting techniques (lift with legs)	☐ Identify and avoid poisonous plants
☐ End-facing/Beveling	☐ Exposure to gamma emitting sources & x-ray	☐ Stay clear of equipment when in operation	☐ Use spotter with warning device (air horn)
☐ Climbing to Lower Levels	☐ Abrasive materials (eye injuries/skin abrasions)	☐ Never stand/walk between two pieces of working equipment	☐ Drink plenty of water, take cool down/warm-up breaks
☐ Climbing to Higher Levels	☐ Multiple pinch/crush points	☐ Stay a minimum of 10 ft. from all power lines	☐ Install pressure relief valve (PRV)
☐ X-Raying	☐ Compressed Gases	☐ Utilize goal post system and spotters	☐ Test the atmospheres for hazards
☐ Cell Phone use	☐ Heat Stress/Hypothermia (Hot/Cold weather)	☐ Flashback arrestors must be in place	☐ Ensure proper ventilation
☐ Run cords, hydraulic lines and Kelley hose	☐ Inclement Weather (Lightning/Rain/Snow/Fog/Icy conditions)	☐ Ensure certifications are in place on all lifting equipment, devices and rigging	☐ Wear sunscreen and appropriate clothing
☐ Road Crossing	☐ Falls from an upper level	☐ Inspect pins and cables daily for problems	☐ Never lift with the teeth of buckets
☐ Loading/Offloading equipment/Materials	☐ Without proper communication drill string can turn inadvertently causing pinched by/ struck by	☐ Establish eye contact and intent with the operator of the equipment before approaching	☐ Visually inspect the leads as they are being run out
☐ Installing shoring/trench box	☐ Poisonous plants (Contact Dermatitis)	☐ Stay on designated ROW	☐ Ensure spill kit is readily available
☐ Break connections apart to install or remove rods or tooling	☐ Worn or damaged leads could cause shock or property damage	☐ Establish good communication between workers and drill operator before any operations start	☐ Ensure hoses are properly connected and whip-checks are in place
☐ Pumping	☐ Uneven/unsecured or bulky loads	☐ Only one person directing operator/driller	☐ Inspect wear points on hoses/HDPE and replace damaged/worn sections
☐ Lowering-in product	☐ Components/drill stem potentially remaining under pressure even after "ALL STOP"	☐ Stop work and take cover in inclement weather	
☐ Backfilling	☐ Overloading equipment – equipment failure	☐ Secure ladders, & ensure they are not damaged	☐ Ensure fall protection (tied-off/guard rails/hand rails) are in place
☐ Boring/Directional Drilling	☐ Welding, cutting, burning tools (Fire Hazard)	☐ Road/traffic signs must be up while working.	
☐ Pipe Entry	☐ Pipe falling off rollers or out of calipers	☐ Use flaggers to control vehicle/pedestrian traffic	☐ Inspect calipers for correct size before use
☐ Ballast operations/buoyancy	☐ Rotating tooling, pinched by, struck by	☐ Ensure adequate number of fire extinguishers on site and in vehicles	☐ Do not place hands in the box or on the ends of the drill stem/pipe
☐ Pre-heating	☐ Grinding tools - Flying Sparks and Debris	☐ Close observation of pipe rollers and cradles	☐ Use GFCI's and proper grounding
☐ Refueling	☐ Water Exposure/Drowning	☐ Install back-up alarms/ensure alarms are working	☐ Communicate with the railroad and ensure flagger protection is provided if necessary – don't work within 25 feet without flagger protection!
☐ Making wire connections	☐ Electrical Shock Hazards	☐ Never step or reach over rotating stems/pipe	
☐ Changing out hydraulic components	☐ Safety Latch on rigging inoperable/missing	☐ Position trailer on level terrain if possible	☐ Erect barricades and ensure personnel are kept clear of test area
☐ Break connections apart – EXIT SIDE	☐ Working near live railroad tracks (train traffic)	☐ Set parking brake on vehicles & equipment when not in use	
☐ Hydrotest product line	☐ Environmental release/spill		☐

I. Introduction

This Spill Prevention Control and Countermeasure Plans (SPCC) have been developed by Michels Corporation (Michels) to serve as a guideline for horizontal directional drilling (HDD) operations. This plan is intended to ensure that the equipment utilized to perform the work and the fuel, oil, and lubricant products used in the day to day operation of the equipment will have no long-term adverse environmental impact on the staging areas required for construction. The guidelines contained in this plan will be implemented by field personnel to prevent accidental releases of hazardous material to the environment and to outline measures taken should an accidental release occur. The drilling project manager for the project is experienced in these matters and is typically the designated Spill Coordinator for Michels.

This SPCC plan was developed using Federal Energy Regulatory Commission (FERC) guidelines for construction activities along a pipeline right-of-way. This plan is intended to comply with all applicable requirements of FERC and local State and County authorities. Since HDD operations are generally confined to two distinct locations, the rig (entry) side and pipe (exit) side, this SPCC plan addresses construction operations at these specific locations only for hazardous materials. This SPCC plan consists of three sections:

- Preventative measures to be taken prior to initiating construction with hazardous materials;
- Preventative procedures to be followed while using hazardous materials during construction;
- Procedures to be implemented should an accidental spill of hazardous material occur;

II. Pre-Construction Hazardous Material Spill Prevention

Prior to construction, all Michels' personnel who will be performing work on site will have attended a FERC-approved environmental training program within the last year. This training program will serve to indoctrinate the personnel and make them aware of the pollution control laws, rules, and regulations applicable to the pipeline right-of-ways. Michels' personnel are highly experienced with the equipment to be used in HDD operations and have worked on numerous FERC governed projects in the past. However all personnel will be refreshed by the project manager and drill superintendent in the operation and maintenance of construction equipment to prevent the accidental discharge or spill of fuel, oil, or lubricants.

Through the environmental training program and the project manager's guidance along with knowledge obtained from past experience, all Michels' personnel will be thoroughly educated on the following topics:

© Copyright, Michels Directional Crossings, a Division of Michels Corporation, 2020

- Precautionary measures to prevent spills;
- Potential sources of spills, such as equipment failure or malfunction and re-fueling procedures;
- Standard operating procedures in case of a spill, including applicable notification requirements;
- Equipment, Materials, and Supplies available for clean-up of a spill;
- Review of known spill events, if any.

Prior to mobilizing equipment to the proposed alignment R.O.W., Michels will thoroughly inspect and if necessary repair or replace equipment components that could potentially leak hazardous material. The equipment will be cleaned of any debris or material observed to be hazardous. All hazardous material storage containers and secondary containment devices will be inspected and if necessary repaired or replaced.

The spill containment and clean-up materials used by Michels will be inventoried and if necessary re-stocked prior to initiating construction operations. At a minimum, the following spill containment and clean-up materials will be located in a central location at each side of the HDD crossings where equipment is in use or hazardous materials are stored in sufficient quantities to contain and clean-up a spill or release should one occur:

- Spill containment kits typically consisting of the following items
  - 1 x 55 gal poly drum
  - 50 x 18” x 18” absorbent pads
  - 8 x 3” x 4’ absorbent socks
  - 6 x 18” x 18” absorbent pillows
  - 3 x 5” x 10’ absorbent booms
  - 4 Disposable plastic bags with ties
  - 4 pair nitrile gloves
- Plastic sheeting
- Floor Dry absorbent material (50 pound bag-typical)
- Personal protective equipment (i.e. gloves and safety glasses)
- Replacement parts and equipment for repair of tanks, hoses, nozzles, etc.
- Equipment and tools to divert spilled fluids and create earthen barriers

III. HDD Construction Operations Hazardous Material Spill Prevention

Once construction activities for the HDD are underway, hazardous material spill prevention will be a continuous element of the operations. During equipment set up, potential sources of hazardous material releases, i.e. fuel tanks, hydraulic oil tanks and hoses, antifreeze tanks, and lubricant storage bins will be located as far away as practicably possible from streams, wetlands, and drainage ways. If necessary, and if practicable, temporary barriers may be constructed or placed between the potential sources of spills and areas identified as extremely sensitive to accidental

© Copyright, Michels Directional Crossings, a Division of Michels Corporation, 2020

spills. Spill containment and clean-up materials/kits will be located in a central location at each side of the drill site location where equipment is in operation or hazardous materials are stored and all personnel will be made aware of the location.

Secondary containment devices will be placed to enclose major sources of potential hazardous spill locations (i.e. fuel storage tanks and hazardous materials storage areas). A site layout drawing for entry locations and exit locations showing the placement of significant sources of hazardous material releases and secondary containment measures are attached in **Appendix A** of this plan. The exact location of the equipment will vary to address specific site conditions after the temporary work space has been prepared for equipment set-up. Access to the sites will be limited by the Project Manager to only authorized personnel and visitors.

During construction, spill refresher briefings will be scheduled quarterly and conducted by Michels. The briefings will refresh Michels' personnel on the topics covered during the pre-construction environmental training as well as review operations to date, including any accidental spills that may have occurred and measures taken for prevention of future spills.

Michels will store, handle and transfer hazardous materials used during HDD operations in a manner to prevent accidental releases or spills of these materials. **Table-1** attached in **Appendix-A** to this plan summarizes the hazardous materials, combined expected volumes, and storage methods for both the entry and exit locations. The Material Safety Data Sheets (MSDS) for every product used by Michels are maintained on file in the drilling survey trailer on site should they be required to assess the hazard potential of a spill. The list of primary hazardous materials (petroleum-based products) to be used by Michels over the course of each HDD crossing is as follows:

- Gasoline
- Diesel Fuel
- Hydraulic Oil
- Lubricants
- Penetrating Oils
- Antifreeze

Michels' personnel will follow specific guidelines set forth in this plan during operation and maintenance of equipment and vehicles used in support of the HDD operations. All waste oil or fuel collected during routine maintenance of the equipment will be contained and disposed of in accordance with state and federal requirements.

© Copyright, Michels Directional Crossings, a Division of Michels Corporation, 2020

IV. Potential Sources of Hazardous Spill-Preventative Measures to be Implemented

For day to day operations, Michels' personnel will follow these guidelines to prevent the accidental release or spill of hazardous materials:

Potential Source of Hazardous Spill	Preventative Measures To be Implemented
Fuel stored in a storage tank	• Except as specified in **Attachment-A** of Appendix-B, locate storage tank at least 100 feet from wetlands or surface waters, at least 200 feet from private water supplies, and at least 400 feet from public water supplies. • Install secondary containment devices around tank in excess of 150% of the maximum volume to be stored. • Inspect tank and secondary containment daily and before filling, implement corrective action upon discovery of deterioration that could cause a spill or result in a leak. Record inspection results weekly on log attached in the appendix to this plan. • Remove any precipitation found within the secondary containment. Prior to removing the precipitation, inspect for film, sheen, discoloration, sludge, emulsion or tarry residue, if present then collect the liquid for disposal. Do not discharge to land or surface waters. • Plug or close all tank openings when not in use. • Maintain sufficient quantities of spill control and clean-up materials in a central location near the storage tank, inspect supply daily. • Provide security measures to protect against vandalism of stored materials
Liquid material stored in a container	• Except as specified in **Attachment-A** of Appendix-B, store container at least 100 feet from wetlands or surface waters, at least 200 feet from private water supplies, and at least 400 feet from public water supplies. • If practicable and if room allows, store containers in a central location within a common secondary containment device. All significant container storage (i.e. greater than 5 gallon) will have secondary containment in excess of 150% of the maximum volume proposed to be stored. • Use small containers which are in good condition (maximum 55 gallon drum). • Take measures to protect the containers from the elements or physical damage. • Inspect containers daily, replace immediately if damaged or leaking. Record inspection results weekly on log attached in **Attachment-B** of Appendix-B to this plan • Close containers when not in use. • Maintain sufficient quantities of spill control and clean-up materials in a central location where the containers are regularly used, inspect supply daily. • Provide security measures to protect against vandalism of stored materials

© Copyright, Michels Directional Crossings, a Division of Michels Corporation, 2020

Liquid material transferred from a storage tank or container to vehicles or equipment	• Except as specified in **Attachment-A** of Appendix-B**,** transfer materials at least 100 feet from wetlands or surface waters, at least 200 feet from private water supplies, and at least 400 feet from public water supplies. Exercise extreme caution for transfers in areas where set-back distances from sensitive areas cannot be met such as placement of absorbent pads or drip pans beneath transfer points, creating temporary earthen berms, or other similar precautionary spill measures. • Transfer during daylight hours or where lighting is adequate to illuminate the area. • Monitor transfer operations at all times. • Maintain sufficient quantities of spill control and clean-up materials in a central location where transfers regularly occur, inspect supply daily. • Provide security measures to protect against vandalism of stored materials

© Copyright, Michels Directional Crossings, a Division of Michels Corporation, 2020

Liquid material used in vehicles and equipment	• Except as specified in **Attachment-A** of Appendix-B, park at least 100 feet from wetlands or surface waters, at least 200 feet from private water supplies, and at least 400 feet from public water supplies. • Inspect daily for leaks or signs of deterioration that could result in a leak. • Repair or replace defective tanks, hoses, fittings, etc. • Maintain sufficient quantities of spill control and clean-up materials in a central location where equipment or vehicles are in use, inspect supply daily. • Provide security measures to protect against vandalism of stored materials

© Copyright, Michels Directional Crossings, a Division of Michels Corporation, 2020

Liquid material transferred from tank vehicle to vehicles & equipment	• Except as specified in **Attachment A** of Appendix-B, tank vehicle used during re-fueling operations shall be specifically designed for supplying fuel to vehicle or equipment tanks and will comply with the requirements of NFPA 385 and other applicable state and federal requirements. • Tank vehicle and its equipment shall be maintained in good repair. • Drivers to be thoroughly trained in the proper method and operation of tank vehicles and in acceptable unloading procedures. • The driver or operator will not leave vehicle unattended during re-fueling operations • All engines to be shut off and operators not on the equipment during refueling operations. • Smoking is to be forbidden on or near any vehicle involved in re-fueling operations. Extreme precaution shall be exercised to prevent people in the vicinity from smoking, lighting matches, or carrying any flame or lighted device. Signs prohibiting smoking or open flames to be prominently displayed in open view on the tank vehicle. • Re-fueling procedures will not be initiated until precautions have been taken to prevent the motion of vehicles involved. Parking brakes to be utilized if available. • Length of refueling hose is typically limited to 50-feet from the hose reel. Tank vehicle to be positioned with respect to vehicles being fueled in order to prevent unwanted traffic between the tank vehicle and vehicle/equipment being fueled. • Each vehicle must contain one portable fire extinguisher that has a minimum rating of 4A, or 4-B,C. Ratings to be in accordance with NFPA-10. Signage on vehicles shall clearly indicate location of fire extinguisher. • Fueling/Re-fueling operations should typically take place during daylight hours. Nighttime fueling operations conducted in adequately lighted areas. • Documentation of training to be made available upon request. • Provide security measures to protect against vandalism of stored materials

Should these guidelines prove to be inadequate to prevent the accidental release or spill of hazardous material, they will be revised and implemented as required to ensure that every possible preventative effort is being taken. All personnel will be made aware of any such revisions at the time of the revision and at the environmental refresher meetings.

V. HDD Construction Operations Hazardous Material Spill Procedures

A spill is an unintentional release of hazardous material to the environment. In the unlikely event that an inadvertent spill of a hazardous material occurs the following steps will be followed at a minimum:

- Step 1 - Containment: Assess the situation prior to attempting to control the spill. Secure the spill scene and attempt to identify and stop the source of spill and

© Copyright, Michels Directional Crossings, a Division of Michels Corporation, 2020

contain at source. Limit access to the site in order to prevent/limit personal and/or property damage. Responders must have knowledge of the spilled material and immediately utilize all available resources (i.e. equipment, personnel, and materials), to contain spill. If adequate resources are not available, expedite mobilization of additional resources from other construction activities as required to fully contain the spill. If the spill cannot be adequately handled by additional resources, Michels will arrange for an approved spill response contractor to mobilize to the site and contain, clean up, and perform required sampling and disposal of spilled materials and residual contaminated debris.

- Step 2 - Remediation: Properly trained personnel shall clean up hazardous material immediately after spill is contained to prevent further migration of hazardous materials into the environment. Responders should consult with proper governmental resource agencies as required. In no case shall containment equipment be used to permanently store contaminated material. Containerize in DOT-approved containers, label, and remove all contaminated material from the construction area and dispose of material in accordance with applicable regulatory guidelines (i.e. transport to hazardous waste disposal facility by licensed waste hauler). The Owner will be provided with proper documentation showing that material was disposed of in a proper manner.

- Step 3 - Notification: Reporting requirements will depend on the quantity of spill. A spill constituting less than a significant spill event will be reported to Owner and/or Owner's representative Chief Inspector **(CI)-_____: ( ) - (office), or ( ) - (cell).**

  Significant spills are defined as: any amount of petroleum, oils, or lubricants discharged to a receiving stream that causes a film, sheen, or discoloration of surface water or adjoining shoreline; or any reportable quantity of hazardous material as defined by 40CFR320. If a significant spill should take place, Michels' Project Manager (PM), will notify the Prime Contractors' Project Manager and Owner's representative Chief Inspector **(CI)-_____( ) - (office), or ( ) - (cell)** of the spill as soon as he has confirmed that the spill has been completely contained. Michels' PM will assist the Owner's representative in submitting the regulatory-required information for hazardous spill notification in accordance with Governing Agency procedures. At the very minimum the project superintendent will provide the CI with the information required on the "Spill Report" included as **Attachment C** in Appendix C.

- Step 4 – Michels' Project Manager will be responsible for any applicable agency reporting requirements. The notification requirements for petroleum and hazardous materials spills are as follows:

  - Federal Contacts:
    National Spill Response Center 1-800-424-8802

© Copyright, Michels Directional Crossings, a Division of Michels Corporation, 2020

- State Contacts:
  State Department of Environmental
  Quality - Spill Notification ( ) - (Business Hours)
  ( ) - (After Hours)

- Local Contacts:
  Local Fire Department _____

- A completed Petroleum and Hazardous Materials Spill Report must be submitted to OWNER & Governmental Agencies within 48 hours.
- Prior to continuing work, Michels will determine the cause of the spill and implement measures to ensure that further spills will not occur.

A More detailed list of Local Emergency Response Personnel and Hospital Location will be attached and filled out as **Attachment D** in Appendix C.

Ethylene Glycol	**40-Gallons**	**1 or 5 Gallon Reinforced Plastic Containers - Storage Trailer**	
Hazardous Wastes:			

APPENDIX-B

Attachment A

The setbacks specified for refueling, fuel storage, and parking of equipment may not be practicable for certain construction activities, including horizontal directional drilling. Exceptions to the setback requirements may be allowed for:

- Areas where removing equipment from a wetland for servicing or overnight parking would increase adverse impacts to the wetland and/or result in significant construction delays;
- Construction sites where moving equipment to refueling stations from pre-fabricated equipment pads is impracticable or where there is a natural barrier from the water-body or wetland (i.e., dike, road or railroad);
- Locations where the water-body or wetland is located adjacent to a road crossing (from which the equipment can be serviced);
- Refueling and fuel storage for immobile equipment including, but not limited to, bending and boring machines, air compressors, padding machines, and hydro-test fill pumps.

ATTACHMENT B
WEEKLY HAZARDOUS MATERIALS/WASTE INSPECTION LOG

For each item listed below, Contractor will indicate whether existing conditions are acceptable (A) or unacceptable (U). Resolution of all unacceptable conditions must be documented. Contractor will inspect all storage facilities on a regular basis, but not less than weekly. Contractor will keep records of all inspections on file. Contractor will provide a coy of the completed form to the Chief Inspector and Environmental Inspector on a weekly basis.

I. STORAGE AREAS FOR FUELS, LUBRICANTS AND CHEMICALS

General

A/U

_____ Construction yard or storage areas secured

_____ National Fire Protection Association symbol posted in storage area or at yard entrance

_____ Storage areas properly prepared and signed

_____ Material Safety Data Sheets available

_____ Hazardous Materials Management Plan/Spill Prevention and Countermeasure Plan available

Hazardous Materials Management

A/U

_____ No evidence of spilled or leaking materials

_____ Incompatible materials separated

_____ All containers labeled properly

_____ All containers securely closed

_____ All containers upright

_____ No evidence of container bulging, damage, rust or corrosion

Secondary Containment Areas

A/U

_____ Containment berm intact and capable of holding 110% of material stored plus precipitation

_____ Lining intact

_____ No materials overhanging berms

_____ No materials stored on berms

_____ No flammable materials used for berms

Compressed Gases

A/U

_____ Cylinders labeled with contents

_____ Cylinders secured from falling

_____ Oxygen stored at least 25 feet away from fuel

_____ Cylinders in bulk storage are separated from incompatible materials by fire barriers or by appropriate distance

II. HAZARDOUS WASTE MANAGEMENT

Waste Container Storage

A/U

_____ No evidence of spilled or leaking wastes

_____ Adequate secondary containment for all wastes

_____ Separate containers for each waste stream—no piles

_____ Waste area not adjacent to combustibles or compressed gases

_____ All containers securely closed

_____ Bungs secured tightly

_____ Open-top drum hoops secured

_____ All containers upright

_____ No evidence of container bulging, corrosion

_____ No severe container damage or rust

_____ Containers are compatible with waste (e.g. plastic liner for corrosives, metal liner for solvents)

_____ No smoking and general danger/warning signs posted

Waste Container Labeling

A/U

_____ Containers properly labeled

_____ Name, address and EPA ID number or ID Number of generator listed (Not required if Contractor is an exempt small quantity generator.)

_____ Accumulation start date listed

_____ Storage start date listed

_____ Chemical and physical composition of waste listed

_____ Hazardous property listed

Nonhazardous Waste Areas

A/U

_____ No litter in yard

_____ No hazardous wastes or used oil mixed with trash (e.g., contaminated soil, oily rags, diapers, or other oily materials)

_____ Empty oil and aerosol containers for disposal are completely emptied

III. EMERGENCY RESPONSE EQUIPMENT

A/U

_____ Shovels

_____ Absorbent materials (booms, pads, pillows, socks, “Speedy Dry”

_____ Personal protective equipment (goggles, gloves)

_____ Fire-fighting equipment

_____ First aid supplies (e.g. medical supplies, squeeze bottle eye wash)

_____ DOT-approved containers

_____ Plastic sheeting, bags and ties

_____ Communication equipment

_____ Bung wrench (non-sparking)

IV. CORRECTIVE ACTIONS TAKEN (Required for all unacceptable conditions)

_____

Petroleum and Hazardous Material Spill Report

Date of spill: _____ Incident No: _____ Date of spill discovery: _____

Time of spill: _____ Time of spill recovery: _____

Location Name: _____ Spread: _____ County: _____

Section: _____ Township: _____ Range: _____

Name and Title of Discoverer: _____

Type of material spilled and product name: _____

Manufacturer's Name: _____

Legal description of spill location: _____

Directions from nearest community: _____

_____

_____

Estimated volume of spill: _____ Estimated material recovered: _____

Weather Conditions: _____

Topography and surface conditions of spill site: _____

Spill medium (pavement, sandy soil, water, etc.): _____

Proximity of spill to surface waters or wetland: _____

Did the spill reach a water body? _____ Yes _____ No

If so, was a sheen present? _____ Yes _____ No

Direction and time of travel (if in stream): _____

Responsible party (name, phone number): _____

Describe the causes and circumstances resulting in the spill: _____

_____

_____

Describe the extent of observed contamination, both horizontal and vertical (i.e., spill-stained soil in a 5'' radius to a depth of 1"):

_____

_____

Resources and installations that may be affected: _____

_____

_____

Potential impact on human health: _____

Describe immediate spill control and/or cleanup methods used and implementation schedule: _____

Current status of cleanup actions: _____

Name/Company/Address/Phone Number for the following:

Construction Superintendent: _____

OWNER
Representative: _____

Environmental Director: _____

Person Who Reported the Spill: _____

Environmental Inspector: _____

On-Scene Agency Coordinator (where applicable): _____

Form completed by: _____ Date: _____

The Contractor must complete this for any petroleum or hazardous material spill regardless of size, and submit the form to OWNER or OWNER's designated representative for construction observation within 48 hours of the occurrence.

ATTACHMENT D
LOCAL Emergency RESPONSE PERSONNEL-HOSPITAL LOCATION

The contractor should provide a listing by municipality of the local emergency response organizations near the HDD project site, and the name and phone number of a contact person for each. For example, list fire and police departments, emergency management organizations, etc. The contractor should update and complete this information as required for his/her work locations. Additions will be made by the Project Manager once they become available prior to drilling operations.

Local Emergency Contacts

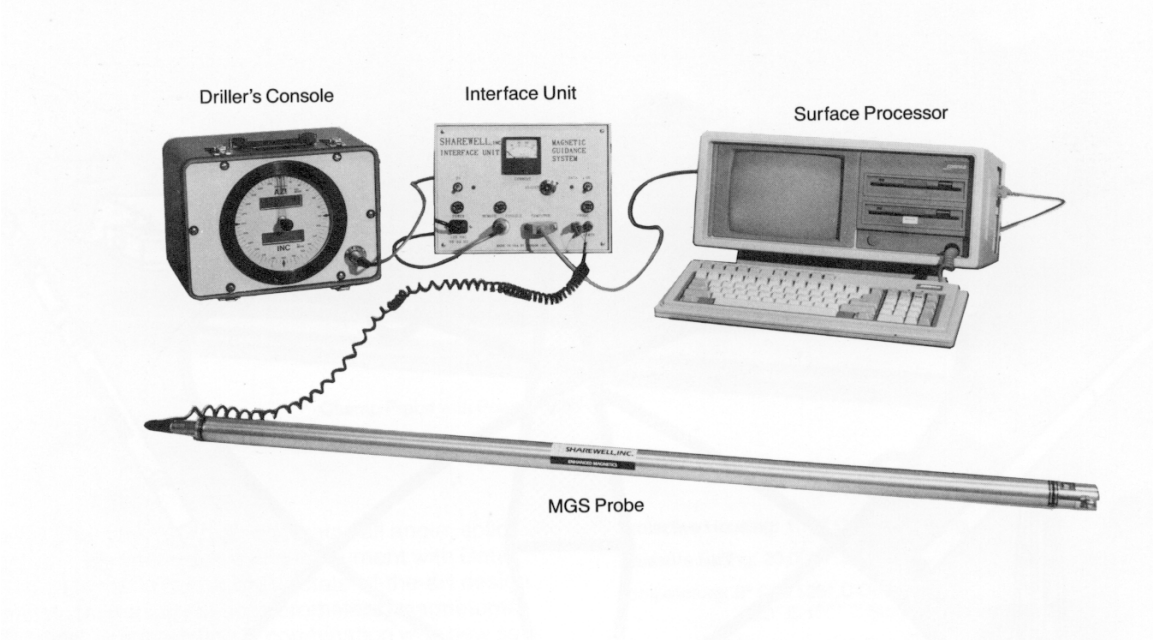
MAGNETIC GUIDANCE SYSTEM



The Magnetic Guidance System (M.G.S.) is designed to address a wide range of applications from normal oil and gas drilling to drainhole and pipeline river crossing drilling.

While directional drilling with either a downhole motor or jetting operation, the system permits you to guide the bit with utmost accuracy. Data is transmitted to surface via a single-conductor wireline.

The system comprises three main sub-sections: the downhole probe, the surface processing unit, and the driller's remote display.

Useful features include the ability to monitor the magnetic moments during drilling operations and to perform probe operational diagnostics while downhole as well as to verify probe calibration at the drilling location.

The directional engineer has the option to drill using either magnetic tool face or gravity tool face, along with having the magnetic hole direction and hole inclination displayed on a continuous basis from the remote readout. The surface processing unit provides duplicate output as the remote display, as well as the magnetic parameters including voltage temperature. A printed record of the data is available at selected intervals by the operator. The M.G.S. downhole probe incorporates the latest technology in accelerometers, magnetometers, calibration and modeling techniques to provide a rugged and reliable tool.

PROBE SPECIFICATIONS

SENSORS:

3 Axis Accelerometers → All Angle Capability
3 Axis Magnetometers → All Angle Capability

DIMENSION & RATING:

Probe Length	47.25"
Probe Diameter	1.38"
Protective Housing	1.75" x 6'
Protective Housing Pressure Rating	20,000 P.S.I.
Maximum Operating Temperature	125°C
Repeatability	0.2° at Horizontal 0.5° at 4° or Less
Accuracy	± 1%

DRILLER'S CONSOLE:

Two 4-character L.C.D. displays for Inclination, Azimuth and Tool Face Mode
360° Rotating Pointer for Tool Face Position
Hermetically Sealed Unit
12 Vac Operation
Electronics Isolated From Case
Easily Positioned Near Driller

SOFTWARE:

Displays Individual Sensor Values
Display of All Magnetic Parameters
Tool Face Offset Option
Complete Diagnostic Check
Automatic Tool Face Switching Mode Option
Data Printout on Request
Menu Driven
Borehole Survey Calculations

SURFACE PROCESSOR:

COMPAQ Portable or IBM Compatible with Printer

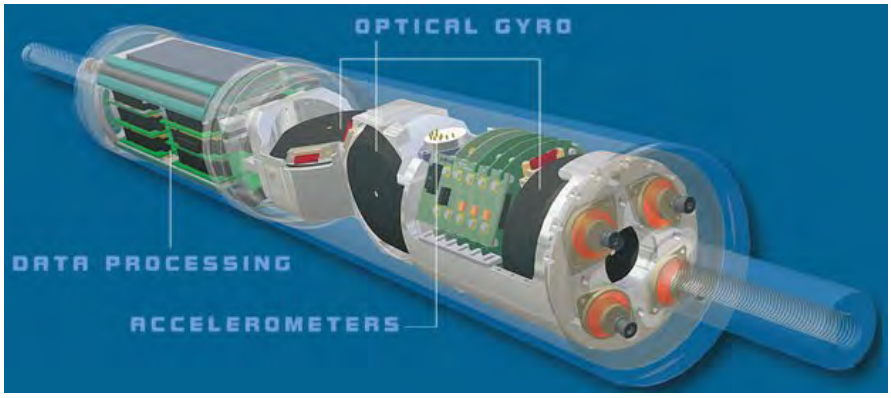
DRILLGUIDE GYRO STEERING TOOL



Technical Specifications –

Electric Power (Input on surface)	110-Volts AC / 50 Hz
Electric Power (Output to Downhole Tool)	48-Volts AC
Tool OD	6-5/8-inches
Tool Length	9-ft
Tool Joint Connection (Box Up x Pin Down)	4-1/2 IF
Maximum Allowed Torque (on Tool Housing)	18,000-foot pounds
Maximum Allowed Push/Pull (on Tool Housing)	75,000-pounds
Maximum Allowed Temperature (on Tool)	120-f
Maximum Allowed Shock (on Tool)	50-g (half sine wave)
Maximum Allowed Vibration (on Tool)	20-g up to 200-Hz
Maximum Allowed Mud Pressure (on Tool)	650-psi
Maximum Allowed Side Load (on Tool Housing)	33,000-pounds

Accuracy –

Azimuth	0.04°
Inclination	0.01°
Tool Face	0.02°

ParaTrack2 Survey and Guidance System Specifications

Downhole Survey Probe

Shock mounted triaxial accelerometers and magnetometers, temperature sensor and digitizing circuitry contained in 1.750 in. dia. x 55.3 in. long beryllium copper pressure barrel. Telemetry and power via wireline.

Temperature Rating:	85°C
Pressure Rating:	1200 bar
Survey Accuracy:	
Inclination:	±0.1°
Azimuth:	±0.4°
Toolface:	±0.5°
Maximum wireline length:	5000 meters

Interface Unit

Input:	85-265 VAC 50-60 HZ
Output:	48VDC, 50 mA

Guidance System

A single signal wire earthed at each end or with a return wire to close the loop.

Guidance Unit Input:	85-265 VAC 50-60 HZ
Guidance Unit Output:	34 VRMS, 6 Amps p-p max.
Position Accuracy:	±2% of separation from signal wire

Drillpipe and Borehole Pressure Module

(requires compatible survey probe)

Borehole gauge, 0-500 psi Full Scale, 1200 psi survival, 2400 psi burst
Drillpipe gauge, 0-2000 psi Full Scale, 6000 psi survival, 10000 psi burst
Non-linearity +/-0.1 %FS
Hysteresis +/-0.015 %FS
Repeatability +/-0.01 %FS

PGM

PARATRACK GYRO MODULE

IMMUNE TO MAGNETIC INTERFERENCE

The ParaTrack Gyro Module (PGM) is the latest in a long line of Vector Magnetics innovations for the HDD market. With no concern of magnetic interference from nearby active utility lines, shorepiles, ship traffic or other transportation activity, drilling may be carried out confidently, regardless of surrounding conditions.

The PGM runs in conjunction with the ParaTrack Steering Tool, providing the ability to tie in with the entire ParaTrack System of tools and software. The PGM is especially effective for initial surface entry, while absolute position may then be verified via the ParaTrack2 Guide Wire or Beacon Tracker, providing confidence that the bore is placed properly relative to the planned exit location prior to punch out.

Features

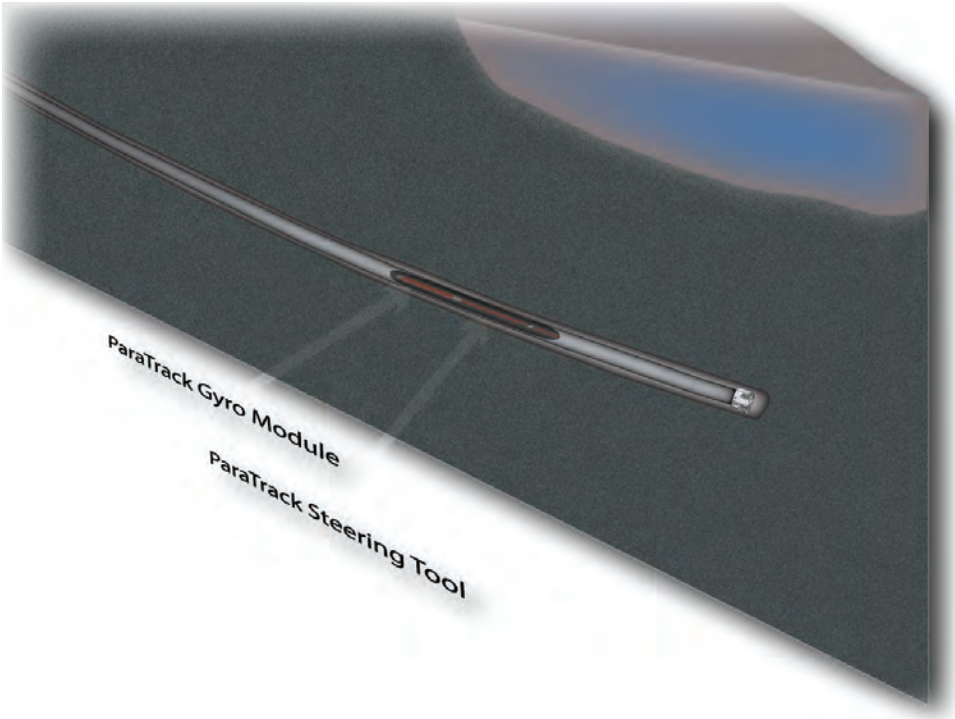
- Fiber optic north seeking gyro system
- Compatible with the entire ParaTrack line of Steering, Tracking and Surveying tools

Benefits

- Accurate surveying in cases of severe magnetic interference
- No specialized handling or personnel required
- Surveys immune from drillstring vibration

Applications

- Surveying in densely developed urban areas
- Verification and correction of magnetic azimuth in long unguided sections



Specifications

Outside Diameter: 2.75" (requires 3.5" collar)

Length: Head to foot - 48"

Internal Operating Temperature: 0-70C

Electrical Connection: 1-3/16", 12 tpi (standard wet connect)

TENSTEER TOOL

© Copyright, Michels Directional Crossings, a Division of Michels Corporation, 2016

TENSTEER DRILLER'S CONSOLE

- Features a 10.4" TFT color LCD with backlight that is sunlight readable
- Physical dimensions are 12.3" X 10.3" X 4.0"
- Weight is less than 12 lbs
- Operating temperature is –10° C to 70° C
- Internally protected against shock and vibration
- Sealed, metal construction that is resistant to dust, dirt and liquids
- 24V DC input power provided by Tensteer Steering Tool Receiver (STR)
- Inclination: Digital Display, ±90° range with 0.1° resolution
- Azimuth: Digital Display, 360° range with 0.1° resolution
- Tool Face: Digital Display, 360° range with 2.0° resolution
- Tool Face has magnetic and high side indicators
- Values for HTOT and GTOT are displayed
- Pipe and Annulus Pressure are capable of being displayed

For more information, contact Tensteer LLC at the following:

4245 Gattis School Rd Round Rock, TX 78664
Phone: 512-670-0447
Fax: 512-670-1070
Email: fred@tensteer.com
Website: www.tensteer.com

TENSTEER HIGH RESOLUTION STEERING TOOL PROBE

- Probe size: 1.75” diameter x 49” long
- Operating temperature: -20°C to 75°C
- Pressure rating: 12,000 psi
- Shock: 1000g, 0.5 msec, half sine
- Vibration: 30g peak, 30 to 500 Hz
- Maximum lateral displacement error: 2.6 ft. per 1000 ft. or a conical uncertainty of ±0.15°
- Survey resolution: 0.02°
- Magnetic resolution: <0.5 nT
- Power: 36 - 42 VDC, 70 mA
- Can track with DC power supply or welder
- Pressure and gamma upgradable
- Compatible with TrueGyde Software
- Can upgrade Tensor Probes

For more information, contact Tensteer LLC at the following:

4245 Gattis School Rd Round Rock, TX 78664
Phone: 512-670-0447
Fax: 512-670-1070
Email: fred@tensteer.com
Website: www.tensteer.com

TENSTEER STEERING TOOL RECEIVER (STR)

- Physical dimensions: 8.2″ X 8.3″ X 11″
- Weight: under 10 lbs
- Operating temperature: -20°C to 70°C
- Internal shock and vibration protection
- Powered by 110 VAC, 60Hz or 220 VAC 50 Hz, 60W max
- Three communication ports – USB, 9 Pin RS232, 25 Pin RS232
- Compatible with Tensor STDC and future Tensteer Driller's Consoles
- Wireline current shown on analog meter
- Power and data status shown on LED lamps

For more information, contact Tensteer LLC at the following:

4245 Gattis School Rd Round Rock, TX 78664
Phone: 512-670-0447
Fax: 512-670-1070

MAX GEL ™

Certified to ANSI/NSF 60

MAX GEL viscosifier is a premium Wyoming bentonite blended with special extenders producing a viscosifier that will yield more than twice as much viscosity as regular Wyoming bentonite. MAX GEL is a high-yielding, easily mixed, superior mud making bentonite in fresh water.

APPLICATIONS

MAX GEL is used in the following applications to rapidly build mud viscosity and provide superior hole cleaning, as well as to help control lost circulation, formation sloughing and promote hole stability in unconsolidated formations.

- Potable water wells
- Mineral exploration (coring and rotary drilling)
- Horizontal directional drilling
- Blast holes
- Shaft drilling
- Monitor / observation wells
- Gel-foam air drilling applications

ADVANTAGES

- Yields more quickly than API-standard bentonite
- Non-toxic and proven suitable for use in drilling potable water wells
- Increased penetration rates are exhibited due to lower solids content than regular bentonite systems
- Transportation and storage costs are reduced due to lower treatment requirements as compared to bentonite

TYPICAL AMOUNTS OF MAX GEL ADDITIONS ADDED TO FRESH WATER

Drilling Application/Desired Results	lb/100gal	lb/bbl	kg/m3
Normal drilling	15 - 25	6 - 11	15 - 30
In gravel or other poorly consolidated formation	25 - 40	12 - 18	35 - 50
Lost circulation control	35 - 45	15 - 20	40 - 45
Added to freshwater mud to improve hole cleaning properties, increase hole stability and develop filter cakes	5 - 10	2 - 5	6 - 14

LIMITATIONS

- Loses effectiveness in water containing >7500 mg/l sodium chloride / 240 mg/l calcium
- If dispersants or thinners are to be used, they should be added sparingly, using 50% or less of the normal treatment

TYPICAL PHYSICAL PROPERTIES

Physical appearance..... Light tan / gray – green powder
Specific gravity ..... 2.3 - 2.5
Approximate yield..... 220 bbl/ton

TOXICITY AND HANDLING

Bioassay information available upon request. No special requirements are necessary for handling and storage. Avoid inhalation of dust. A dust respirator and goggles are recommended if mixing in an enclosed area.

PACKAGING AND STORAGE

MAX GEL is packaged in 50 lb. (22.7-kg), multi-wall, paper sacks and is available in bulk. Store in a dry location (slip hazard when wet) and minimize dust (use dust-less systems for handling, storage and cleanup).

This material is supplied solely for informational purposes and M-I L.L.C. makes no guarantees or warranties, either expressed or implied, with respect to the accuracy or use of this data. All product warranties and guarantees shall be governed by the Standard Terms of Sale.

MATERIAL SAFETY DATA SHEET
MAX GEL

1. CHEMICAL PRODUCT AND COMPANY IDENTIFICATION

TRADE NAME: MAX GEL

OTHER NAME: Bentonite

CHEMICAL CLASS: Naturally occuring mineral.

APPLICATIONS: Oil well drilling fluid additive. Viscosifier.

EMERGENCY TELEPHONE: 281-561-1600

SUPPLIER: Supplied by a Business Unit of
M-I L.L.C.
P.O. Box 42842, Houston, Texas 77242-2842
See cover sheet for local supplier.

TELEPHONE: 281-561-1509
FAX: 281-561-7240

CONTACT PERSON: Sam Hoskin - Manager, Occupational Health

2. COMPOSITION, INFORMATION ON INGREDIENTS

INGREDIENT NAME:	CAS No.:	CONTENTS :	EPA RQ:	TPQ:
Silica, crystalline, quartz	14808-60-7	2-15 %		
Bentonite	1302-78-9	70-95 %		
Silica, crystalline, Cristobalite	14464-46-1	2-12 %		
Silica, crystalline, Tridymite	15468-32-3	1-5 %		
Gypsum	13397-24-5	0-1 %		

3. HAZARDS IDENTIFICATION

EMERGENCY OVERVIEW:

CAUTION! MAY CAUSE EYE, SKIN AND RESPIRATORY TRACT IRRITATION. Avoid contact with eyes, skin and clothing. Avoid breathing airborne product. Keep container closed. Use with adequate ventilation. Wash thoroughly after handling.

This product is a/an gray to tan powder. Slippery when wet. No significant immediate hazards for emergency response personnel are known.

ACUTE EFFECTS:

HEALTH HAZARDS, GENERAL:

Particulates may cause mechanical irritation to the eyes, nose, throat and lungs. Particulate inhalation may lead to pulmonary fibrosis, chronic bronchitis, emphysema and bronchial asthma. Dermatitis and asthma may result from short contact periods.

INHALATION: May be irritating to the respiratory tract if inhaled.

INGESTION: May cause gastric distress, nausea and vomiting if ingested.

SKIN: May be irritating to the skin.

EYES: May be irritating to the eyes.

CHRONIC EFFECTS:
CARCINOGENICITY:

IARC: Not listed. NTP: Not listed. OSHA: Not regulated.

ATTENTION! CANCER HAZARD. CONTAINS CRYSTALLINE SILICA WHICH CAN CAUSE CANCER. Risk of cancer depends on duration and level of exposure.

IARC Monographs, Vol. 68, 1997, concludes that there is sufficient evidence that inhaled crystalline silica in the form of quartz or cristobalite from occupational sources causes cancer in humans. IARC classification Group 1.

ROUTE OF ENTRY:

Inhalation. Skin and/or eye contact.

TARGET ORGANS:

Respiratory system, lungs. Skin. Eyes.

4. FIRST AID MEASURES

GENERAL: Persons seeking medical attention should carry a copy of this SDS with them.

INHALATION: Move the exposed person to fresh air at once. Perform artificial respiration if breathing has stopped. Get medical attention.

INGESTION: Drink a couple of glasses water or milk. Do not give victim anything to drink of he is unconscious. Get medical attention.

SKIN: Wash skin thoroughly with soap and water. Remove contaminated clothing. Get medical attention if any discomfort continues.

EYES: Promptly wash eyes with lots of water while lifting the eye lids. Continue to rinse for at least 15 minutes. Get medical attention if any discomfort continues.

5. FIRE FIGHTING MEASURES

AUTO IGNITION TEMP. (?F): N/D
FLAMMABILITY LIMIT - LOWER(%): N/D
FLAMMABILITY LIMIT - UPPER(%): N/D

EXTINGUISHING MEDIA:

This material is not combustible. Use extinguishing media appropriate for surrounding fire.

SPECIAL FIRE FIGHTING PROCEDURES:

No specific fire fighting procedure given.

UNUSUAL FIRE & EXPLOSION HAZARDS:

No unusual fire or explosion hazards noted.

HAZARDOUS COMBUSTION PRODUCTS:

Not relevant.

6. ACCIDENTAL RELEASE MEASURES

PERSONAL PRECAUTIONS:

Wear proper personal protective equipment (see SDS Section 8).

SPILL CLEAN-UP PROCEDURES:

Avoid generating and spreading of dust. Shovel into dry containers. Cover and move the containers. Flush the area with water. Do not contaminate drainage or waterways. Repackage or recycle if possible.

7. HANDLING AND STORAGE

HANDLING PRECAUTIONS:

Avoid handling causing generation of dust. Wear full protective clothing for prolonged exposure and/or high concentrations. Eye wash and emergency shower must be available at the work place. Wash hands often and change clothing when needed. Provide good ventilation. Mechanical ventilation or local exhaust ventilation is required.

STORAGE PRECAUTIONS:

Store at moderate temperatures in dry, well ventilated area. Keep in original container.

8. EXPOSURE CONTROLS, PERSONAL PROTECTION

		OSHA PEL:		ACGIH TLV:		OTHER:		
INGREDIENT NAME:	**CAS No.:**	**TWA:**	**STEL:**	**TWA:**	**STEL:**	**TWA:**	**STEL:**	**UNITS:**
Silica, crystalline, quartz	14808-60-7	*		0.1				mg/m3 resp.dust
Bentonite	1302-78-9	5		3				mg/m3 resp.dust
Silica, crystalline, Cristobalite	14464-46-1	*		0.05				mg/m3 resp.dust
Silica, crystalline, Tridymite	15468-32-3	*		0.05				mg/m3 resp.dust
Gypsum	13397-24-5	15						mg/m3 total dust

INGREDIENT COMMENTS:

* OSHA PELs for Mineral Dusts containing crystalline silica are 10 mg/m3 / (%SiO2+2) for quartz and 1/2 the calculated quartz value for cristobalite and tridymite.

PROTECTIVE EQUIPMENT:

ENGINEERING CONTROLS:

Use appropriate engineering controls such as, exhaust ventilation and process enclosure, to reduce air contamination and keep worker exposure below the applicable limits.

VENTILATION: Supply natural or mechanical ventilation adequate to exhaust airborne product and keep exposures below the applicable limits.

RESPIRATORS: Use at least a NIOSH-approved N95 half-mask disposable or reuseable particulate respirator. In work environments containing oil mist/aerosol use at least a NIOSH-approved P95 half-mask disposable or reuseable particulate respirator. For exposures exceeding 10 x PEL use a NIOSH-approved N100 Particulate Respirator.

PROTECTIVE GLOVES:

Use suitable protective gloves if risk of skin contact.

EYE PROTECTION:

Wear dust resistant safety goggles where there is danger of eye contact.

PROTECTIVE CLOTHING:

Wear appropriate clothing to prevent repeated or prolonged skin contact.

HYGIENIC WORK PRACTICES:
Wash promptly with soap and water if skin becomes contaminated. Change work clothing daily if there is any possibility of contamination.

9. PHYSICAL AND CHEMICAL PROPERTIES

APPEARANCE/PHYSICAL STATE:	Powder, dust.
COLOR:	Grey. to Tan.
ODOR:	Odorless or no characteristic odor.
SOLUBILITY DESCRIPTION:	Insoluble in water.
DENSITY/SPECIFIC GRAVITY (g/ml):	2.3-2.6 TEMPERATURE (?F): 68
BULK DENSITY:	67 lb/ft3; 1068 kg/m3
VAPOR DENSITY (air=1):	N/A
VAPOR PRESSURE:	N/A TEMPERATURE (?F):

10. STABILITY AND REACTIVITY

STABILITY: Normally stable.

CONDITIONS TO AVOID:
N/A.

HAZARDOUS POLYMERIZATION:
Will not polymerize.

POLYMERIZATION DESCRIPTION:
Not relevant.

MATERIALS TO AVOID:
N/A

HAZARDOUS DECOMPOSITION PRODUCTS:
No specific hazardous decomposition products noted.

11. TOXICOLOGICAL INFORMATION

TOXICOLOGICAL INFORMATION:
No toxicological data is available for this product.

12. ECOLOGICAL INFORMATION

ECOLOGICAL INFORMATION:
Contact M-I Environmental Affairs for ecological information.

13. DISPOSAL CONSIDERATIONS

WASTE MANAGEMENT:
This product does not meet the criteria of a hazardous waste if discarded in its purchased form. Under RCRA, it is the responsibility of the user of the product to determine at the time of disposal, whether the product meets RCRA criteria for hazardous waste. This is because product uses, transformations, mixtures, processes, etc, may render the resulting materials hazardous. Empty containers retain residues. All labeled precautions must be observed.

DISPOSAL METHODS:

Recover and reclaim or recycle, if practical. Should this product become a waste, dispose of in a permitted industrial landfill. Ensure that containers are empty by RCRA criteria prior to disposal in a permitted industrial landfill.

14. TRANSPORT INFORMATION

PRODUCT RQ: N/A

U.S. DOT:
U.S. DOT CLASS: Not regulated.

CANADIAN TRANSPORT:
TDGR CLASS: Not regulated.

SEA TRANSPORT:
IMDG CLASS: Not regulated.

AIR TRANSPORT:
ICAO CLASS: Not regulated.

15. REGULATORY INFORMATION

REGULATORY STATUS OF INGREDIENTS:

NAME:	CAS No:	TSCA:	CERCLA:	SARA 302:	SARA 313:	DSL(CAN):
Silica, crystalline, quartz	14808-60-7	Yes	No	No	No	Yes
Bentonite	1302-78-9	Yes	No	No	No	Yes
Silica, crystalline, Cristobalite	14464-46-1	Yes	No	No	No	Yes
Silica, crystalline, Tridymite	15468-32-3	Yes	No	No	No	Yes
Gypsum	13397-24-5	Yes	No	No	No	Yes

US FEDERAL REGULATIONS:
WASTE CLASSIFICATION: Not a hazardous waste by U.S. RCRA criteria. See Section 13.

REGULATORY STATUS: This Product or its components, if a mixture, is subject to following regulations (Not meant to be all inclusive - selected regulations represented):

SECTION 313: This product does not contain toxic chemical subject to the reporting requirements of Section 313 of Title III of the Superfund Amendment and Reauthorization Act of 1986 and 40 CFR Part 372.

SARA 311 Categories:
1: Immediate (Acute) Health Effects.
2. Delayed (Chronic) Health Effects.

The components of this product are listed on or are exempt from the following international chemical registries:
TSCA (U.S.)
DSL (Canada)
EINECS (Europe)

STATE REGULATIONS:

STATE REGULATORY STATUS:

This product or its components, if a mixture, is subject to following regulations (Not meant to be all inclusive - selected regulations represented):.

None.

PROPOSITION 65: This product contains the following chemical(s) considered by the State of California's Safe Drinking Water and Toxic Enforcement Act of 1986 as causing cancer or reproductive toxicity, and for which warnings are now required: Silica, crystalline

CANADIAN REGULATIONS:
LABELS FOR SUPPLY:

REGULATORY STATUS:

This Material Safety Data Sheet has been prepared in compilance with the Controled Product Regulations.

Canadian WHMIS Classification: D2A - Other Toxic Effects: Very Toxic Material

Super Gel-X
High Yield Bentonite

DESCRIPTION:

- Super Gel-X is a 200 mesh, high viscosity 200-bbl yield, sodium bentonite for use in all freshwater drilling conditions.

RECOMMENDED USE:

- May be used for all types of freshwater mud rotary drilling.

CHARACTERISTICS:

- Highly concentrated for maximum yield.
- Fast and easy mixing.
- Reduces solids and increases lifting power.
- Removes cuttings.
- Cools and lubricates bit.
- Stabilizes bore holes.

MIXING AND APPLICATION:

- Mixing ratios are based on 200-bbl yield material using freshwater. Level of water purity will affect bentonite performance.

- Super Gel-X mixing ratio in lbs. per 100 gallons of water:

  Normal conditions ..... 15 to 25 lbs.
  Sand and gravel ..... 25 to 35 lbs.
  Fluid loss controls ..... 35 to 40 lbs.

PACKAGING:

- 50 pound, multi-wall, non-tear, waterproof bags, 48 bags per pallet, and all pallets are stretch-wrapped.

1500 W. Shure Drive **Arlington Heights, IL 60004** **1434-(3112) 392-4600**

The information and data contained herein are believed to be accurate and reliable. American Colloid Company makes no warranty of any kind and accepts no responsibility for the results obtained through this application of this information.

MATERIAL SAFETY DATA SHEET

May be used to comply with OSHA's Hazard Communication Standard, 29 CFR 1910.1200. Standard must be consulted for specific requirements.

PRODUCT NAME: SUPER GEL-X™

Section I MANUFACTURER'S INFORMATION

MANUFACTURER'S NAME & ADDRESS:

CETCO – *Drilling Products Group*
1500 West Shure Drive
Arlington Heights, IL 60004

Date Prepared: June 1, 2002

Telephone Number: 847-392-5800 Fax 847-506.6150
EMERGENCY CONTACT: CHEMTREC 800-424-9300
E-mail: www.cetco.com

Section II HAZARDOUS INGREDIENTS/IDENTITY INFORMATION

HAZARDOUS COMPONENTS: (Specific Chemical Identity: Common Name(s))	OSHA PEL	ACGIH TLV	Other Limits Recommended	% (optional)
Crystalline Quartz: CAS# 14808-60-7			*	< 6%
Respirable Crystalline Quartz:			NIOSH	< 2%
Present (TWA)	0.1 mg/m^3	0.1 mg/m^3	50 ug/m^3	
Proposed (TWA)		50.0 ug/m^3		
Nuisance Dust:				
Respirable	5 mg/m^3	5 mg/m^3		
Total Dust	15 mg/m^3	10 mg/m^3		

*** WARNING:** This product contains a small amount of crystalline silica, which may cause delayed respiratory disease if inhaled over a prolonged period of time. Avoid breathing dust. Use NIOSH/MSHA approved respirator where TLV for crystalline silica (Quartz) may be exceeded. IARC Monographs on the evaluation of the Carcinogenic Risk of Chemicals to Humans (volume 68, 1997) concludes that crystalline silica is carcinogenic to humans in the form of quartz. IARC classification 1.

The small quantities of crystalline silica (quartz) found in this product are, under normal conditions, naturally coated with an unremovable layer of amorphous silica and/or bentonite clay. IARC (vol. 68, 1997, pg. 191-192) has stated that crystalline silica (quartz) can differ in toxicity depending on the minerals with which it is combined, citing studies in IARC (vol. 42, 1987, p. 86) which stated that the toxic effect of crystalline silica (quartz) is reduced by the "protective effect...due mainly to clay minerals..."

National Institute for Occupational Safety and Health (NIOSH) has recommended that the permissible exposure limit be changed to 50 micrograms respirable free silica per cubic meter of air (0.05 mg/ m^3) as determined by a full shift sample up to a 10 hour working day, 40 hours per week. *See*: 1974 NIOSH criteria for a recommended Standard for Occupational Exposure to Crystalline Silica should be consulted for more detailed information.

PEL - OSHA Permissible Exposure Limit.

TLV - American Conference of Governmental Industrial Hygienists (ACGIH) Threshold Limit Value.

TWA - 8 hour time weighted average

Note: The Permissible Exposure Limits (PEL) reported above are the pre - 1989 limits that were reinstated by OSHA June 30, 1993 following a decision by the United States Circuit Court of Appeals for the 11th Circuit. Federal OSHA is now enforcing these PELs. More restrictive exposure limits may be enforced by some other jurisdictions.

PRODUCT IDENTIFICATION:

Chemical Name: Dry Mixture of Inorganic Mineral Compounds.
NFPA/HMIS: Health - 2, Fire - 0, Reactivity - 0, Specific Hazard - *See Section VI.*
Shipping Class: Not Regulated (DOT / 49CFR, IMDG, ICAO / IATA).

Section III PHYSICAL/CHEMICAL CHARACTERISTICS

Boiling Point: Not Applicable.
Vapor Pressure (mm Hg.)**:** Not Applicable.
Vapor Density (AIR = 1)**:** Not Applicable.
Solubility in Water: Negligible.
Specific Gravity (H_2O = 1)**:** 2.5
Melting Point: 1400°F
Evaporation Rate (Butyl Acetate = 1)**:** Not Applicable.
Appearance and Odor: Tan or beige to light gray colored powder to fine granules, odorless.

Copyright 2002 CETCO All rights reserved.
CETCO is a wholly owned subsidiary of AMCOL International Corp.

PRODUCT NAME: SUPER GEL-X™

Section IV FIRE AND EXPLOSION HAZARD DATA

Flash Point (*Method Used*)**:** Not Available. **Flammable Limits:** Not Available. **LEL** - NA. **UEL** - NA.
Extinguishing Media: Not Applicable. **Special Fire Fighting Procedure:** Not Applicable.
Unusual Fire/Explosion Hazards: Product may pose possible dust explosion under *extremely rare* circumstances or conditions.

Section V REACTIVITY DATA

Stability: Stable **Conditions to Avoid** - None Known.
Incompatibility (*Materials to Avoid*)**:** Powerful oxidizing agents such as fluorine, chlorine trifluoride, manganese trioxide, etc.
Hazardous Decomposition or By-products: Silica will dissolve in hydrofluoric acid producing a corrosive gas, silicon tetrafluoride.
Hazardous Polymerization: Will Not Occur **Conditions to Avoid** - None Known.

Section VI HEALTH HAZARD DATA

Route(s) of Entry: Inhalation? Yes Skin? No Ingestion? No
Health Hazards (Acute and Chronic):

Inhalation: Breathing silica dust may not cause noticeable injury or illness even though permanent lung damage may be occurring. Inhalation of dust may have the following serious chronic health effects:
Silicosis: Excessive inhalation of respirable crystalline silica dust may cause a progressive, disabling and sometimes-fatal lung disease called silicosis. Symptoms include cough, shortness of breath, wheezing, non-specific chest illness and reduced pulmonary function. Smoking exacerbates this disease. Individuals with silicosis are predisposed to develop tuberculosis.
Cancer Status: The International Agency for Research on Cancer has determined that crystalline silica inhaled in the form of quartz or cristobalite from occupational sources is carcinogenic to humans (Group 1 - carcinogenic to humans). Refer to *IARC Monograph 68, Silica, Some Silicates and Organic Fibers* (published in June 1997) in conjunction with the use of these
materials. The National Toxicology Program classifies respirable crystalline silica as "reasonably anticipated to be a carcinogen". For further information *See*: "Adverse effects of Crystalline Silica Exposure" published by the American Thoracic Society Medical Section of the American Lung Association, American Journal of Respiratory and Critical Care Medicine, Volume 155, page 761-765, 1997.

Other Data with Possible Relevance to Human Health: The small quantities of crystalline silica (quartz) found in this product are, under normal conditions, naturally coated with an unremovable layer of amorphous silica and/or bentonite clay. IARC (Vol. 68, 1997, pg. 191-192) has stated that crystalline silica (quartz) can differ in toxicity depending on the minerals with which it is combined, citing studies in IARC (Vol. 42, 1987 pg. 86) which stated that the toxic effect of crystalline silica (quartz) is reduced by the "protective effect....due mainly to clay minerals..."

Carcinogenicity: NTP? No IARC Monographs? Yes OSHA Regulated? No

Signs and Symptoms of Exposure: Excessive inhalation of generated dust may result in shortness of breath and reduced pulmonary function.

Medical Conditions Generally Aggravated by Exposure: Individuals with respiratory disease, including but not limited to, asthma and bronchitis, or subject to eye irritation should not be exposed to respirable crystalline silica (quartz) dust.

Emergency and First Aid Procedures:
Eyes & Skin: Flush with water.
Gross Inhalation of Dust: Remove to fresh air; give oxygen or artificial respiration if necessary; seek medical attention.
Ingestion: If large amounts are swallowed, get immediate medical attention.

Section VII PRECAUTIONS FOR SAFE HANDLING AND USE

Steps to be Taken in Case Material is Released or Spilled: Vacuum if possible to avoid generating airborne dust. Avoid breathing dust. Wear an approved respirator. Avoid adding water; product will become slippery when wet.
Waste Disposal Method: Bury in an approved sanitary landfill, in accordance with federal, state and local regulations.
Precautions to Be Taken in Handling and Storing: Avoid breathing dust, use NIOSH/MSHA approved respirator where TLV limits for Crystalline Silica may be exceeded.
Other Precautions: Slippery when wet.

Copyright 2002 CETCO All rights reserved.
CETCO is a wholly owned subsidiary of AMCOL International Corp.

PRODUCT NAME: SUPER GEL-X™

Section VIII CONTROL MEASURES

Respiratory Protection: Use appropriate respiratory protection for respirable particulate based on consideration of airborne workplace concentration and duration of exposure arising from intended end use. Refer to the most recent standards of ANSI (z88.2) OSHA (29 CFR 1910.134), MSHA (30 CFR Parts 56 and 57) and NIOSH Respirator Decision Logic.

Ventilation: Use local exhaust as required to maintain exposures below applicable occupational exposure limits (*See Section II*). See also ACGIH "Industrial Ventilation – A Manual for Recommend Practice", (*current edition*).

Protective Gloves: Not Required. **Eye Protection:** Recommended.

Other Protective Clothing or Equipment: None. **Work/Hygienic Practices:** Use good housekeeping practices.

Section IX REGULATORY INFORMATION

SARA 311/312: Hazard Categories for SARA Section 311/312 Reporting: Chronic Health
SARA 313: This product contains the following chemicals subject to annual release reporting requirements under the SARA section 313 (40 CFR 372): None

CERCLA section 103 Reportable Quantity: None

California Proposition 65: *This product contains the following substances known to the state of California to cause cancer and/or reproductive harm: This product contains crystalline silica (respirable); however, the user should note that the small quantities of crystalline silica (quartz) found in this product are, under normal conditions, naturally coated with an unremovable layer of amorphous silica and/or bentonite clay. IARC (Vol. 68, 1997, pg. 191-192) has stated that crystalline silica (quartz) can differ in toxicity depending on the minerals with which it is combined. Citing studies in IARC (Vol. 42, 1987, p. 86) which stated that the toxic effect of crystalline silica (quartz) is reduced by the "protective effect....due mainly to clay minerals...".*

Toxic Substances Control Act: All of the components of this product are listed on the EPA TSCA Inventory or are exempt from notification requirements.

Canadian Environmental Protection Act: All the components of this product are listed on the Canadian Domestic Substances List or exempt from notification requirements.

European Inventory of Commercial Chemical Substances: All the components of this product are listed on the EINECS Inventory or exempt from notification requirements. (The EINECS number for Quartz: 231-545-5)
European Community Labeling Classification: Harmful (Xn)
European Community Risk and Safety Phrases: R40, R48, S22

Japan MITI: All the components of this product are existing chemical substances as defined in the Chemical Substance Control Law.

Australian Inventory of Chemical Substances: All the components of this product are listed on the AICS Inventory or exempt from notification requirements.

Canadian WHMIS Classification: Class D, Division 2, Subdivision A (Very Toxic Material causing other Toxic Effects)

NF-+PA Hazard Rating: Health: 2 Fire: 0 Reactivity: 0
HMIS Hazard Rating: Health: * Fire: 0 Reactivity: 0

***Warning** - Chronic health effect possible - inhalation of silica dust may cause lung injury/disease (silicosis). Take appropriate measures to avoid breathing dust. *See Section II*.

MATERIAL SAFETY DATA SHEET

Product Trade Name: **BARA-KADE® BENTONITE**

Revision Date: 31-Mar-2005

1. CHEMICAL PRODUCT AND COMPANY IDENTIFICATION

Product Trade Name: BARA-KADE® BENTONITE
Synonyms: None
Chemical Family: Mineral
Application: Additive

Manufacturer/Supplier

BPM Minerals LLC
3000 N Sam Houston Parkway East
Houston, TX 77032

Telephone: (281) 871-7900
Fax: (281) 871-7940
Emergency Telephone: (800) 666-9260 or (713) 753-3000

Prepared By

Chemical Compliance
Telephone: 1-580-251-4335

2. COMPOSITION/INFORMATION ON INGREDIENTS

SUBSTANCE	CAS Number	PERCENT	ACGIH TLV-TWA	OSHA PEL-TWA
Crystalline silica, cristobalite	14464-46-1	0 - 1%	0.05 mg/m^3	1/2 x $\frac{10 \text{ mg/m}^3}{\%SiO2 + 2}$
Crystalline silica, tridymite	15468-32-3	0 - 1%	0.05 mg/m^3	1/2 x $\frac{10 \text{ mg/m}^3}{\%SiO2 + 2}$
Crystalline silica, quartz	14808-60-7	1 - 5%	0.05 mg/m^3	$\frac{10 \text{ mg/m}^3}{\%SiO2 + 2}$
Bentonite	1302-78-9	60 - 100%	Not applicable	Not applicable

More restrictive exposure limits may be enforced by some states, agencies, or other authorities.

3. HAZARDS IDENTIFICATION

Hazard Overview

CAUTION! - ACUTE HEALTH HAZARD
May cause eye and respiratory irritation.

DANGER! - CHRONIC HEALTH HAZARD
Breathing crystalline silica can cause lung disease, including silicosis and lung cancer. Crystalline silica has also been associated with scleroderma and kidney disease.

This product contains quartz, cristobalite, and/or tridymite which may become airborne without a visible cloud. Avoid breathing dust. Avoid creating dusty conditions. Use only with adequate ventilation to keep exposures below recommended exposure limits. Wear a NIOSH certified, European Standard EN 149, or equivalent respirator when using this product. Review the Material Safety Data Sheet (SDS) for this product, which has been provided to your employer.

4. FIRST AID MEASURES

Inhalation If inhaled, remove from area to fresh air. Get medical attention if respiratory irritation develops or if breathing becomes difficult.

Skin Wash with soap and water. Get medical attention if irritation persists.

Eyes In case of contact, immediately flush eyes with plenty of water for at least 15 minutes and get medical attention if irritation persists.

Ingestion Under normal conditions, first aid procedures are not required.

Notes to Physician Treat symptomatically.

5. FIRE FIGHTING MEASURES

Flash Point/Range (F):	Not Determined
Flash Point/Range (C):	Not Determined
Flash Point Method:	Not Determined
Autoignition Temperature (F):	Not Determined
Autoignition Temperature (C):	Not Determined
Flammability Limits in Air - Lower (%):	Not Determined
Flammability Limits in Air - Upper (%):	Not Determined

Fire Extinguishing Media All standard firefighting media.

Special Exposure Hazards Not applicable.

Special Protective Equipment for Fire-Fighters Not applicable.

NFPA Ratings: Health 0, Flammability 0, Reactivity 0
HMIS Ratings: Flammability 0, Reactivity 0, Health 0*

6. ACCIDENTAL RELEASE MEASURES

Personal Precautionary Measures Use appropriate protective equipment. Avoid creating and breathing dust.

Environmental Precautionary Measures None known.

Procedure for Cleaning / Absorption Collect using dustless method and hold for appropriate disposal. Consider possible toxic or fire hazards associated with contaminating substances and use appropriate methods for collection, storage and disposal.

7. HANDLING AND STORAGE

Handling Precautions This product contains quartz, cristobalite, and/or tridymite which may become airborne without a visible cloud. Avoid breathing dust. Avoid creating dusty conditions. Use only with adequate ventilation to keep exposure below recommended exposure limits. Wear a NIOSH certified, European Standard En 149, or equivalent respirator when using this product. Material is slippery when wet.

Storage Information Use good housekeeping in storage and work areas to prevent accumulation of dust. Close container when not in use. Do not reuse empty container.

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

Engineering Controls Use approved industrial ventilation and local exhaust as required to maintain exposures below applicable exposure limits listed in Section 2.

Respiratory Protection Wear a NIOSH certified, European Standard EN 149, or equivalent respirator when using this product.

Hand Protection Normal work gloves.

Skin Protection Wear clothing appropriate for the work environment. Dusty clothing should be laundered before reuse. Use precautionary measures to avoid creating dust when removing or laundering clothing.

Eye Protection Wear safety glasses or goggles to protect against exposure.

Other Precautions None known.

9. PHYSICAL AND CHEMICAL PROPERTIES

Physical State:	Solid
Color:	Various
Odor:	Odorless
pH:	8-10
Specific Gravity @ 20 C (Water=1):	2.65
Density @ 20 C (lbs./gallon):	Not Determined
Bulk Density @ 20 C (lbs/ft3):	50-70
Boiling Point/Range (F):	Not Determined
Boiling Point/Range (C):	Not Determined
Freezing Point/Range (F):	Not Determined
Freezing Point/Range (C):	Not Determined
Vapor Pressure @ 20 C (mmHg):	Not Determined
Vapor Density (Air=1):	Not Determined
Percent Volatiles:	Not Determined
Evaporation Rate (Butyl Acetate=1):	Not Determined
Solubility in Water (g/100ml):	Insoluble
Solubility in Solvents (g/100ml):	Not Determined
VOCs (lbs./gallon):	Not Determined

Viscosity, Kinematic @ 20 C (centistrokes):	Not Determined
Partition Coefficient/n-Octanol/Water:	Not Determined
Molecular Weight (g/mole):	Not Determined

10. STABILITY AND REACTIVITY

Stability Data: Stable

Hazardous Polymerization: Will Not Occur

Conditions to Avoid	None anticipated
Incompatibility (Materials to Avoid)	Hydrofluoric acid.
Hazardous Decomposition Products	Amorphous silica may transform at elevated temperatures to tridymite (870 C) or cristobalite (1470 C).
Additional Guidelines	Not Applicable

11. TOXICOLOGICAL INFORMATION

Principle Route of Exposure	Eye or skin contact, inhalation.
Inhalation	Inhaled crystalline silica in the form of quartz or cristobalite from occupational sources is carcinogenic to humans (IARC, Group 1). There is sufficient evidence in experimental animals for the carcinogenicity of tridymite (IARC, Group 2A). Breathing silica dust may cause irritation of the nose, throat, and respiratory passages. Breathing silica dust may not cause noticeable injury or illness even though permanent lung damage may be occurring. Inhalation of dust may also have serious chronic health effects (See "Chronic Effects/Carcinogenicity" subsection below).
Skin Contact	May cause mechanical skin irritation.
Eye Contact	May cause eye irritation.
Ingestion	None known
Aggravated Medical Conditions	Individuals with respiratory disease, including but not limited to asthma and bronchitis, or subject to eye irritation, should not be exposed to quartz dust.
Chronic Effects/Carcinogenicity	Silicosis: Excessive inhalation of respirable crystalline silica dust may cause a progressive, disabling, and sometimes-fatal lung disease called silicosis. Symptoms include cough, shortness of breath, wheezing, non-specific chest illness, and reduced pulmonary function. This disease is exacerbated by smoking. Individuals with silicosis are predisposed to develop tuberculosis. Cancer Status: The International Agency for Research on Cancer (IARC) has determined that crystalline silica inhaled in the form of quartz or cristobalite from occupational sources can cause lung cancer in humans (Group 1 - carcinogenic to humans) and has determined that there is sufficient evidence in experimental animals for the carcinogenicity of tridymite (Group 2A - possible carcinogen to humans). Refer to IARC Monograph 68, Silica, Some Silicates and Organic Fibres (June 1997) in conjunction with the use of these minerals. The National Toxicology Program classifies respirable crystalline silica as "Known to be a human carcinogen". Refer to the 9th Report on Carcinogens (2000). The American Conference of Governmental Industrial Hygienists (ACGIH) classifies crystalline silica, quartz, as a suspected human carcinogen (A2). There is some evidence that breathing respirable crystalline silica or the disease silicosis is associated with an increased incidence of significant disease endpoints such as scleroderma (an immune system disorder manifested by scarring of the lungs, skin, and other internal organs) and kidney disease.

Other Information For further information consult "Adverse Effects of Crystalline Silica Exposure" published by the American Thoracic Society Medical Section of the American Lung Association, American Journal of Respiratory and Critical Care Medicine, Volume 155, pages 761-768 (1997).

Toxicity Tests

Oral Toxicity: Not determined

Dermal Toxicity: Not determined

Inhalation Toxicity: Not determined

Primary Irritation Effect: Not determined

Carcinogenicity Refer to IARC Monograph 68, Silica, Some Silicates and Organic Fibres (June 1997).

Genotoxicity: Not determined

Reproductive / Developmental Toxicity: Not determined

12. ECOLOGICAL INFORMATION

Mobility (Water/Soil/Air) Not determined

Persistence/Degradability Not determined

Bio-accumulation Not Determined

Ecotoxicological Information

Acute Fish Toxicity: TLM96: 10000 ppm (Oncorhynchus mykiss)
Acute Crustaceans Toxicity: Not determined
Acute Algae Toxicity: Not determined

Chemical Fate Information Not determined

Other Information Not applicable

13. DISPOSAL CONSIDERATIONS

Disposal Method Bury in a licensed landfill according to federal, state, and local regulations.

Contaminated Packaging Follow all applicable national or local regulations.

14. TRANSPORT INFORMATION

Land Transportation

DOT

Cancer Status: The International Agency for Research on Cancer (IARC) has determined that crystalline silica inhaled in the form of quartz or cristobalite from occupational sources can cause lung cancer in humans (Group 1 - carcinogenic to humans) and has determined that there is sufficient evidence in experimental animals for the carcinogenicity of tridymite (Group 2A - possible carcinogen to humans). Refer to IARC Monograph 68, Silica, Some Silicates and Organic Fibres (June 1997) in conjunction with the use of these minerals. The National Toxicology Program classifies respirable crystalline silica as "Known to be a human carcinogen". Refer to the 9th Report on Carcinogens (2000). The American Conference of Governmental Industrial Hygienists (ACGIH) classifies crystalline silica, quartz, as a suspected human carcinogen (A2). There is some evidence that breathing respirable crystalline silica or the disease silicosis is associated with an increased incidence of significant disease endpoints such as scleroderma (an immune system disorder manifested by scarring of the lungs, skin, and other internal organs) and kidney disease.

Other Information For further information consult "Adverse Effects of Crystalline Silica Exposure" published by the American Thoracic Society Medical Section of the American Lung Association, American Journal of Respiratory and Critical Care Medicine, Volume 155, pages 761-768 (1997).

Toxicity Tests

Oral Toxicity: Not determined

Dermal Toxicity: Not determined

Inhalation Toxicity: Not determined

Primary Irritation Effect: Not determined

Carcinogenicity Refer to IARC Monograph 68, Silica, Some Silicates and Organic Fibres (June 1997).

Genotoxicity: Not determined

Reproductive / Developmental Toxicity: Not determined

12. ECOLOGICAL INFORMATION

Mobility (Water/Soil/Air) Not determined

Persistence/Degradability Not determined

Bio-accumulation Not Determined

Ecotoxicological Information

Acute Fish Toxicity: TLM96: 10000 ppm (Oncorhynchus mykiss)
Acute Crustaceans Toxicity: Not determined
Acute Algae Toxicity: Not determined

Chemical Fate Information Not determined

Other Information Not applicable

13. DISPOSAL CONSIDERATIONS

Disposal Method Bury in a licensed landfill according to federal, state, and local regulations.

Contaminated Packaging Follow all applicable national or local regulations.

14. TRANSPORT INFORMATION

Land Transportation

DOT
Not restricted

Canadian TDG
Not restricted

ADR Not restricted

Air Transportation

ICAO/IATA Not restricted

Sea Transportation

IMDG
Not restricted

Other Shipping Information

Labels: None

15. REGULATORY INFORMATION

US Regulations

US TSCA Inventory	All components listed on inventory.
EPA SARA Title III Extremely Hazardous Substances	Not applicable
EPA SARA (311,312) Hazard Class	Acute Health Hazard Chronic Health Hazard
EPA SARA (313) Chemicals	This product does not contain a toxic chemical for routine annual "Toxic Chemical Release Reporting" under Section 313 (40 CFR 372).
EPA CERCLA/Superfund Reportable Spill Quantity For This Product	Not applicable.
EPA RCRA Hazardous Waste Classification	If product becomes a waste, it does NOT meet the criteria of a hazardous waste as defined by the US EPA.
California Proposition 65	The California Proposition 65 regulations apply to this product.
MA Right-to-Know Law	One or more components listed.
NJ Right-to-Know Law	One or more components listed.
PA Right-to-Know Law	One or more components listed.

Canadian Regulations

Canadian DSL Inventory	All components listed on inventory.
WHMIS Hazard Class	D2A Very Toxic Materials (Crystalline silica)

16. OTHER INFORMATION

The following sections have been revised since the last issue of this SDS
Not applicable

Additional Information

For additional information on the use of this product, contact your local Halliburton representative.

For questions about the Material Safety Data Sheet for this or other Halliburton products, contact Chemical Compliance at 1-580-251-4335.

2. Hazards identification

2.1 Classification of the substance or mixture

GHS - Classification

Health hazards Not classified

Environmental hazards Not classified

Physical Hazards

Combustible dust	-

2.2 Label elements

Signal word
WARNING

May form combustible dust concentrations in air

Precautionary statements
P240 - Ground/bond container and receiving equipment
P243 - Take precautionary measures against static discharge

P241 - Use explosion-proof electrical/ ventilating/ lighting/ equipment

3. Composition/information on Ingredients

3.1 Substances

Component	CAS-No	Weight % - range
Carboxymethylcellulose sodium salt	9004-32-4	99

3.2 Mixtures

Not Applicable

4. First aid measures

4.1 Description of first-aid measures

Inhalation — If inhaled, remove from area to fresh air. Get medical attention if respiratory irritation develops or if breathing becomes difficult.

Ingestion — Rinse mouth. Do not induce vomiting without medical advice. Never give anything by mouth to an unconscious person. Seek medical attention if irritation occurs.

Skin contact — Wash off immediately with soap and plenty of water removing all contaminated clothes and shoes. Get medical attention immediately if symptoms occur.

Eye contact — Promptly wash eyes with lots of water while lifting eye lids. Remove contact lenses. Continue to rinse for at least 15 minutes. Get medical attention if any discomfort continues.

4.2 Most important symptoms and effects, both acute and delayed

General advice — The severity of the symptoms described will vary dependant of the concentration and the length of exposure. If adverse symptoms develop, the casualty should be transferred to hospital as soon as possible.

Main symptoms

Inhalation	Please see Section 11. Toxicological Information for further information.
Ingestion	Please see Section 11. Toxicological Information for further information.
Skin contact	Please see Section 11. Toxicological Information for further information.
Eye contact	Please see Section 11. Toxicological Information for further information.

4.3 Indication of any immediate medical attention and special treatment needed

Notes to physician Treat symptomatically.

5. Fire-fighting measures

5.1 Extinguishing media

Suitable extinguishing media
Water Fog, Alcohol Foam, CO_2, Dry Chemical.

Extinguishing media which shall not be used for safety reasons
None known.

5.2 Special hazards arising from the substance or mixture

Unusual fire and explosion hazards
Suspended dust may present a dust explosion hazard.

Hazardous combustion products
Carbon oxides (COx).

5.3 Advice for firefighters

Special protective equipment for fire-fighters
As in any fire, wear self-contained breathing apparatus and full protective gear.

Special Fire-Fighting Procedures
Containers close to fire should be removed immediately or cooled with water.

6. Accidental release measures

6.1 Personal precautions, protective equipment and emergency procedures

Extinguish all ignition sources. Avoid sparks, flames, heat and smoking. Evacuate personnel to safe areas. Use personal protective equipment. See also section 8. If spilled, take caution, as material can cause surfaces to become very slippery.

6.2 Environmental precautions

The product should not be allowed to enter drains, water courses or the soil.

Environmental exposure controls
Avoid release to the environment.

6.3 Methods and materials for containment and cleaning up

Methods for containment
Prevent further leakage or spillage if safe to do so.

Methods for cleaning up
Sweep up and shovel into suitable containers for disposal. After cleaning, flush away traces with water. Material becomes slippery when wet. Use caution if wet.

6.4 Reference to other sections

See section 13 for more information.

7. Handling and storage

7.1 Precautions for safe handling

Handling
Handle in accordance with good industrial hygiene and safety practice. Avoid contact with skin and eyes. Avoid dust formation.

Hygiene measures
Use good work and personal hygiene practices to avoid exposure. Do not eat, drink or smoke when using this product.

7.2 Conditions for safe storage, including any incompatibilities

Technical measures/precautions Ensure adequate ventilation. Provide appropriate exhaust ventilation at places where dust is formed. Keep airborne concentrations below exposure limits.

Storage precautions Keep away from open flames, hot surfaces and sources of ignition. Keep containers tightly closed in a dry, cool and well-ventilated place.

8. Exposure controls/personal protection

8.1 Control parameters

Exposure limits Control as an ACGIH particulate not otherwise specified (PNOS): 10 mg/m^3 (Inhalable); 3 mg/m^3 (Respirable) and an OSHA particulate not otherwise regulated (PNOR): 15 mg/m^3 (Total); 5 mg/m^3 (Respirable).

Component	ACGIH TLV	OSHA PEL
Carboxymethylcellulose sodium salt 9004-32-4 (99)	Not Determined	Not Determined

8.2 Exposure controls

All chemical Personal Protective Equipment (PPE) should be selected based on an assessment of both the chemical hazard present and the risk of exposure to those hazards. The PPE recommendations below are based on an assessment of the chemical hazards associated with this product. Where this product is used in a mixture with other products or fluids, additional hazards may be created and as such further assessment of risk may be required. The risk of exposure and need of respiratory protection will vary from workplace to workplace and should be assessed by the user in each situation.

Engineering measures to reduce exposure
Ensure adequate ventilation.

Personal protective equipment

Eye protection It is good practice to wear goggles when handling any chemical. Tightly fitting safety goggles.

Hand protection Wear chemical resistant gloves such as nitrile or neoprene.

Respiratory protection	All respiratory protection equipment should be used within a comprehensive respiratory protection program that meets the requirements of 29 CFR 1910.134 (U.S. OSHA Respiratory Protection Standard) or local equivalent. If exposed to airborne mist/aerosol of this product, use at least a NIOSH-approved N95 half-mask disposable or re-usable particulate respirator. In work environments containing oil mist/aerosol, use at least a NIOSH-approved P95 half-mask disposable or reuseable particulate respirator. If exposed to vapors from this product use a NIOSH/MSHA-approved respirator with an Organic Vapor cartridge.
Skin and body protection	Wear suitable protective clothing.
Hygiene measures	Wash hands before eating, drinking or smoking, Remove and wash contaminated clothing before re-use.

9. Physical and chemical properties

9.1 Information on basic physical and chemical properties

Physical state	Solid powder
Appearance	Opaque
Odor	Mild Odorless
Color	Off-white - Tan
Odor threshold	Not applicable

Property	**Values**	**Remarks**
pH	No information available	
pH @ dilution	6.5-8.0 @ 1% in H2O	
Melting/freezing point		
Boiling point/range	No information available	
Flash point	Does not flash	
Evaporation rate (BuAc =1)		
Flammability (solid, gas)	Not Applicable	
Flammability Limits in Air		
Upper flammability limit	Not applicable	
Lower flammability limit	Not applicable	
Vapor pressure	0 mmHg	
Vapor density	Not applicable	
Specific gravity	1.5 - 1.6	
Bulk density	No information available	
Relative density	No information available	
Water solubility	Gels on contact with water	
Solubility in other solvents	No information available	
Autoignition temperature	No information available	
Decomposition temperature	No information available	
Kinematic viscosity	No information available	
Dynamic viscosity	No information available	
Log Pow	Not determined	
Explosive properties	Not Applicable	
Oxidizing properties	None known.	

9.2 Other information

Pour point	No information available
Molecular weight	No information available
VOC content(%)	None
Density	No information available

10. Stability and reactivity

10.1 Reactivity

No specific reactivity hazards associated with this product.

10.2 Chemical stability

Stable under normal temperature conditions and recommended use.

10.3 Possibility of Hazardous Reactions

Hazardous polymerization
Hazardous polymerization does not occur.

Hazardous Reactions
None known.

10.4 Conditions to avoid

Heat, flames and sparks.

10.5 Incompatible materials

Strong oxidizing agents.

10.6 Hazardous decomposition products

Carbon oxides (COx).

11. Toxicological information

11.1 Information on toxicological effects

Acute toxicity

Inhalation — Inhalation of dust may cause shortness of breath, tightness of the chest, a sore throat and cough.

Eye contact — Dust may cause mechanical irritation.

Skin contact — Repeated exposure may cause skin dryness or cracking.

Ingestion — Irritant; may cause pain or discomfort to mouth, throat and stomach.

Acute toxicity — 0% of the mixture consists of ingredient(s) of unknown toxicity.

Component	LD50 Oral	LD50 Dermal	LC50 Inhalation
Carboxymethylcellulose sodium salt	= 27000 mg/kg (Rat)	> 2 g/kg (Rabbit)	> 5800 mg/m³ (Rat) 4 h

Sensitization — This product does not contain any components suspected to be sensitizing.

Mutagenic effects — This substance has no evidence of mutagenic properties.

Carcinogenicity — This substance has no evidence of carcinogenic properties.

Reproductive toxicity	None known.
Developmental toxicity	Not known to cause birth defects or have a deleterious effect on a developing fetus.
Routes of exposure	Inhalation. Skin contact. Eye contact.
Routes of entry	None known.
Specific target organ toxicity (single exposure)	Not classified
Specific target organ toxicity (repeated exposure)	Not classified.
Aspiration hazard	Not Applicable.

12. Ecological information

12.1 Toxicity

Toxicity to algae
See component information below.

Toxicity to fish
See component information below.

Toxicity to daphnia and other aquatic invertebrates
See component information below.

Component	Toxicity to fish	Toxicity to algae	Toxicity to daphnia and other aquatic invertebrates
Carboxymethylcellulose sodium salt	No information available	No information available	No information available

12.2 Persistence and degradability

No product level data available.

12.3 Bioaccumulative potential

No data available.

12.4 Mobility in soil

No information available.

12.5 Results of PBT and vPvB assessment

This substance is not considered to be persistent, bioaccumulating or toxic (PBT)
This substance is not considered to be very persistent nor very bioaccumulating (vPvB)

12.6 Other adverse effects.

None known. Check for additional information in sect. 7.

13. Disposal considerations

13.1 Waste treatment methods

Waste from residues / unused products	Dispose of in accordance with local regulations.
Contaminated packaging	Empty containers should be taken for local recycling, recovery or waste disposal.

14. Transport information

14.1 UN Number

UN/ID No. (ADR/RID/ADN/ADG)	Not regulated
UN No. (IMDG)	Not regulated
UN No. (ICAO)	Not regulated
UN No. (DOT)	Not regulated

14.2 Proper shipping name

Not regulated for transportation by DOT, TDG, IMDG and ICAO/IATA.

14.3 Hazard class(es)

ADR/RID/ADN Hazard class	Not regulated
IMDG Hazard class	Not regulated
ICAO Hazard class/division	Not regulated
DOT Hazard class	Not regulated

14.4 Packing group

ADR/RID/ADN Packing Group	Not regulated
IMDG Packing group	Not regulated
ICAO Packing group	Not regulated
DOT Packing group	Not regulated

14.5 Environmental hazard

No

14.6 Special precautions

Not Applicable

15. Regulatory information

U.S. Federal and State Regulations

SARA 311/312 Hazard Categories
Not a SARA 311/312 hazard.

SARA 302/304, 313, CERCLA RQ, California Proposition 65
Note: If no components are listed below, this product is not subject to the referenced SARA and CERCLA regulations and is not known to contain a Proposition 65 listed chemical at a level that is expected to pose a significant risk under anticipated use conditions.

Component	SARA 302 / TPQs	SARA 313	CERCLA RQ
Carbohydrate	N/A	N/A	N/A

State Comments
Proposition 65: This product is not known to contain chemicals considered by the State of California's Safe Drinking Water and Toxic Enforcement Act of 1986 as causing cancer and/or reproductive toxicity at levels that are expected to pose a significant risk under anticipated use conditions.

Canadian Classification

This product has been classified in accordance with the hazard criteria of the CPR and the SDS contains all the information required by the CPR.

WHMIS Hazard Class Not a controlled product.

3. Composition/information on Ingredients

3.1 Substances

Not Applicable

3.2 Mixtures

Not Applicable

Comments
No classified ingredients, or those having occupational exposure limits, present above the level of disclosure.

4. First aid measures

4.1 Description of first-aid measures

Inhalation — If inhaled, remove from area to fresh air. Get medical attention if respiratory irritation develops or if breathing becomes difficult.

Ingestion — Rinse mouth. Do not induce vomiting without medical advice. Never give anything by mouth to an unconscious person. Get medical attention if symptoms occur.

Skin contact — Wash off immediately with soap and plenty of water removing all contaminated clothes and shoes. Get medical attention immediately if symptoms occur.

Eye contact — Remove contact lenses. Promptly wash eyes with lots of water while lifting eye lids. Continue to rinse for at least 15 minutes. Get medical attention if any discomfort continues.

4.2 Most important symptoms and effects, both acute and delayed

General advice — The severity of the symptoms described will vary dependant of the concentration and the length of exposure. If adverse symptoms develop, the casualty should be transferred to hospital as soon as possible.

Main symptoms

Inhalation — Please see Section 11. Toxicological Information for further information.

Ingestion — Please see Section 11. Toxicological Information for further information.

Skin contact — Please see Section 11. Toxicological Information for further information.

Eye contact — Please see Section 11. Toxicological Information for further information.

4.3 Indication of any immediate medical attention and special treatment needed

Notes to physician Treat symptomatically.

5. Fire-fighting measures

5.1 Extinguishing media

Suitable extinguishing media
Use extinguishing media appropriate for surrounding material.

Extinguishing media which shall not be used for safety reasons
None known.

5.2 Special hazards arising from the substance or mixture

Unusual fire and explosion hazards
None known.

Hazardous combustion products
Carbon oxides (COx).

5.3 Advice for firefighters

Special protective equipment for fire-fighters
As in any fire, wear self-contained breathing apparatus and full protective gear.

Special Fire-Fighting Procedures
Containers close to fire should be removed immediately or cooled with water.

6. Accidental release measures

6.1 Personal precautions, protective equipment and emergency procedures

Use personal protective equipment. See also section 8.

6.2 Environmental precautions

The product should not be allowed to enter drains, water courses or the soil.

Environmental exposure controls
Avoid release to the environment.

6.3 Methods and materials for containment and cleaning up

Methods for containment
Prevent further leakage or spillage if safe to do so. Dike far ahead of liquid spill for later disposal.

Methods for cleaning up
Absorb with earth, sand or other non-combustible material and transfer to containers for later disposal. After cleaning, flush away traces with water.

6.4 Reference to other sections

See section 13 for more information.

7. Handling and storage

7.1 Precautions for safe handling

Handling
Handle in accordance with good industrial hygiene and safety practice. Avoid contact with skin and eyes. Do not breathe vapors or spray mist. Avoid spills and splashing during use.

7.2 Conditions for safe storage, including any incompatibilities

Technical measures/precautions	Ensure adequate ventilation. Keep airborne concentrations below exposure limits.
Storage precautions	Keep containers tightly closed in a dry, cool and well-ventilated place.
Packaging material	Use specially constructed containers only

8. Exposure controls/personal protection

8.1 Control parameters

Exposure limits The product does not contain any hazardous materials with occupational exposure limits established.

8.2 Exposure controls

All chemical Personal Protective Equipment (PPE) should be selected based on an assessment of both the chemical hazard present and the risk of exposure to those hazards. The PPE recommendations below are based on an assessment of the chemical hazards associated with this product. Where this product is used in a mixture with other products or fluids, additional hazards may be created and as such further assessment of risk may be required. The risk of exposure and need of respiratory protection will vary from workplace to workplace and should be assessed by the user in each situation.

Engineering measures to reduce exposure
Ensure adequate ventilation.

Personal protective equipment

Eye protection	It is good practice to wear goggles when handling any chemical. Tightly fitting safety goggles.
Hand protection	Wear chemical resistant gloves such as nitrile or neoprene.
Respiratory protection	No personal respiratory protective equipment normally required, In case of insufficient ventilation wear suitable respiratory equipment.
Skin and body protection	Wear suitable protective clothing, Provide eyewash station.

Hygiene measures Wash hands before eating, drinking or smoking, Remove and wash contaminated clothing before re-use.

9. Physical and chemical properties

9.1 Information on basic physical and chemical properties

Physical state	Liquid
Appearance	Transparent
Odor	Mild
Color	Light yellow
Odor threshold	Not applicable

Property	Values	Remarks
pH	6 - 8	

pH @ dilution	
Melting/freezing point	
Boiling point/range	90 °C / 194 °F
Flash point	No information available
Evaporation rate (BuAc =1)	
Flammability (solid, gas)	Not Applicable
Flammability Limits in Air	
Upper flammability limit	Not applicable
Lower flammability limit	Not applicable
Vapor pressure	No information available
Vapor density	No information available
Specific gravity	1.27
Bulk density	No information available
Relative density	No information available
Water solubility	Slightly soluble in water.
Solubility in other solvents	No information available
Autoignition temperature	No information available
Decomposition temperature	No information available
Kinematic viscosity	No information available
Dynamic viscosity	No information available
Log Pow	Does not bioaccumulate
Explosive properties	No information available
Oxidizing properties	No information available

9.2 Other information

Pour point	No information available
Molecular weight	No information available
VOC content(%)	No information available
Density	No information available

10. Stability and reactivity

10.1 Reactivity

No specific reactivity hazards associated with this product.

10.2 Chemical stability

Stable under normal temperature conditions and recommended use.

10.3 Possibility of Hazardous Reactions

Hazardous polymerization
Hazardous polymerization does not occur.

10.4 Conditions to avoid

None known.

10.5 Incompatible materials

Strong oxidizing agents.

10.6 Hazardous decomposition products

Carbon oxides (COx).

11. Toxicological information

11.1 Information on toxicological effects

Acute toxicity

Inhalation	Inhalation of vapors in high concentration may cause irritation of respiratory system.
Eye contact	May cause slight irritation.
Skin contact	Prolonged contact may cause redness and irritation.
Ingestion	Ingestion may cause stomach discomfort.
Acute toxicity	0% of the mixture consists of ingredient(s) of unknown toxicity.

Sensitization	This product does not contain any components suspected to be sensitizing.
Mutagenic effects	No evidence of mutagenic properties.
Carcinogenicity	No evidence of carcinogenic properties.
Reproductive toxicity	No evidence of toxicity to reproduction.
Developmental toxicity	Not known to cause birth defects or have a deleterious effect on a developing fetus.
Routes of exposure	Eye contact. Skin contact. Inhalation.
Routes of entry	No route of entry noted.
Specific target organ toxicity (single exposure)	Not classified
Specific target organ toxicity (repeated exposure)	Not classified.
Aspiration hazard	Not Applicable.

12. Ecological information

12.1 Toxicity

Toxicity to algae
See component information below.

Toxicity to fish
See component information below.

Toxicity to daphnia and other aquatic invertebrates
See component information below.

12.2 Persistence and degradability

No product level data available.

12.3 Bioaccumulative potential

No data available.

12.4 Mobility in soil

No information available.

12.5 Results of PBT and vPvB assessment

This preparation contains no substance considered to be persistent, bioaccumulating nor toxic (PBT)
This preparation contains no substance considered to be very persistent nor very bioaccumulating (vPvB)

12.6 Other adverse effects.

None known.

13. Disposal considerations

13.1 Waste treatment methods

Waste from residues / unused products	Dispose of in accordance with local regulations.
Contaminated packaging	Empty containers should be taken for local recycling, recovery or waste disposal.

14. Transport information

14.1 UN Number

UN/ID No. (ADR/RID/ADN/ADG)	Not regulated
UN No. (IMDG)	Not regulated
UN No. (ICAO)	Not regulated
UN No. (DOT)	Not regulated

14.2 Proper shipping name

Not regulated for transportation by DOT, TDG, IMDG and ICAO/IATA.

14.3 Hazard class(es)

ADR/RID/ADN Hazard class	Not regulated
IMDG Hazard class	Not regulated
ICAO Hazard class/division	Not regulated
DOT Hazard class	Not regulated

14.4 Packing group

ADR/RID/ADN Packing Group	Not regulated
IMDG Packing group	Not regulated
ICAO Packing group	Not regulated
DOT Packing group	Not regulated

14.5 Environmental hazard

No

14.6 Special precautions
Not Applicable

15. Regulatory information

15.1 Safety, health and environmental regulations/legislation specific for the substance or mixture

International inventories

USA (TSCA)	Complies
European Union (EINECS and ELINCS)	Does not Comply
Canada (DSL)	Complies
Philippines (PICCS)	Complies
Japan (ENCS)	Complies
China (IECSC)	Complies
Australia (AICS)	Complies
Korean (KECL)	Complies
New Zealand (NZIoC)	Complies

IMPORTS, Canada
No import volume restrictions.

U.S. Federal and State Regulations

SARA 311/312 Hazard Catagories Not a SARA 311/312 hazard.

State Comments
Proposition 65: This product is not known to contain chemicals considered by the State of California's Safe Drinking Water and Toxic Enforcement Act of 1986 as causing cancer and/or reproductive toxicity at levels that are expected to pose a significant risk under anticipated use conditions.

This product has been classified in accordance with the hazard criteria of the CPR and the MSDS contains all the information required by the CPR.

WHMIS Hazard Class Not a controlled product.

16. Other information

SAFETY DATA SHEET

1. PRODUCT AND COMPANY IDENTIFICATION

Product identifier
Product Code 25392
Product Name **TORQMASTER®**

Other means of identification

Recommended use of the chemical and restrictions on use
Use only for the purpose on the product label.

Details of the supplier of the safety data sheet

Manufacturer / Manufactured For
WYO-BEN
1345 Discovery Dr
Billings, Montana 59102
Phone: 406-652-6351
Emergency telephone number
24 Hour Emergency Phone Number: 1-800-535-5053

2. HAZARDS IDENTIFICATION

This product is not classified according to paragraph (d) of 29 CFR 1910.1200 and does not require a hazard warning label.

Hazard Classification

Acute aquatic toxicity	Category 3
Chronic aquatic toxicity	Category 3

Signal Word
None

Hazard Statements
Harmful to aquatic life with long lasting effects

Hazard Symbol
None

Precautionary Statements - Prevention
Avoid release to the environment.

Precautionary Statements - Response
Specific Treatment (See Section 4 on the SDS).
IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing. If eye irritation persists: Get medical advice/attention.
IF ON SKIN: Wash with plenty of soap and water. Wash contaminated clothing before reuse.
IF INHALED: Remove victim to fresh air and keep at rest in a position comfortable for breathing.
IF SWALLOWED: Rinse mouth. DO NOT induce vomiting. Drink plenty of water.

Precautionary Statements – Storage
Keep out of reach of children.

Precautionary Statements - Disposal
Dispose of contents/container to an approved waste disposal plant.

Hazards not otherwise classified (HNOC)

Other Information

Unknown Acute Toxicity 0.06% of the mixture consists of ingredient(s) of unknown toxicity.

3. COMPOSITION/INFORMATION ON INGREDIENTS

Chemical Name	CAS No.	Weight-%	Trade Secret
PROPRIETARY	Proprietary	1-5	*
Sodium Carbonate	497-19-8	1-5	*

*The exact percentage (concentration) of composition has been withheld as a trade secret.

4. FIRST AID MEASURES

First aid measures

Skin Contact Wash off immediately with soap and plenty of water while removing all contaminated clothes and shoes. Wash contaminated clothing before reuse. If skin irritation persists, call a physician.

Eye contact Immediately flush with plenty of water. After initial flushing, remove any contact lenses and continue flushing for at least 15 minutes. If irritation persists, call a physician.

Inhalation If mists/vapors are formed or irritation occurs, leave area and do not return until mists/vapors have dissipated. If irritation persists, see a physician.

Ingestion Rinse mouth. Do NOT induce vomiting. Never give anything by mouth to an unconscious person. Drink plenty of water. If irritation persists, see a physician.

Most important symptoms and effects, both acute and delayed

Symptoms No Information available.

Indication of any immediate medical attention and special treatment needed

Note to physicians Treat symptomatically.

5. FIRE-FIGHTING MEASURES

Suitable extinguishing media

Use extinguishing measures that are appropriate to local circumstances and the surrounding environment.

Unsuitable extinguishing media

Caution: Use of water spray when fighting fire may be inefficient.

Specific hazards arising from the chemical

No Information available.

Explosion data

Sensitivity to Mechanical Impact None
Sensitivity to Static Discharge None

Protective equipment and precautions for firefighters

As in any fire, wear self-contained breathing apparatus pressure-demand, MSHA/NIOSH (approved or equivalent) and full protective gear.

NFPA **Health Hazard 0** **Fire Hazard 0** **Reactivity 0**

6. ACCIDENTAL RELEASE MEASURES

Personal precautions, protective equipment and emergency procedures

Personal precautions Ensure adequate ventilation, especially in confined areas.

Environmental precautions

Environmental precautions See Section 12 for additional ecological information.

Methods and material for containment and cleaning up

Methods for containment Prevent further leakage or spillage if safe to do so.

Methods for cleaning up Soak up with inert absorbent material. Pick up and transfer to properly labeled containers.

7. HANDLING AND STORAGE

Precautions for safe handling

Advice on safe handling Handle in accordance with good industrial hygiene and safety practice.

Conditions for safe storage, including any incompatibilities

Storage Conditions Keep containers tightly closed in a dry, cool and well-ventilated place.

Incompatible materials None known based on information supplied.

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

Control parameters

Exposure Guidelines This product, as supplied, does not contain any hazardous materials with occupational exposure limits established by the region specific regulatory bodies.

Appropriate engineering controls

Engineering Controls Showers, Eyewash stations & Ventilation systems.

Individual protection measures, such as personal protective equipment

Eye/face protection Wear safety glasses with side shields (or goggles).

Skin and body protection Wear chemical resistant gloves.

Respiratory protection If exposure limits are exceeded or irritation is experienced, NIOSH/MSHA approved respiratory protection should be worn. Positive-pressure supplied air respirators or air purifying respirators may be required for high airborne contaminant concentrations. Respiratory protection must be provided in accordance with current local regulations.

General Hygiene Handle in accordance with good industrial hygiene and safety practice.

9. PHYSICAL AND CHEMICAL PROPERTIES

Information on basic physical and chemical properties

Physical state	Viscous Liquid
Appearance	Pink, Dark
Odor	Mild
Odor threshold	No Information available

Property	Values
pH	9.5 - 11.5
Specific Gravity	1.01
Viscosity	No Information available
Melting point/freezing point	No Information available
Boiling point / boiling range	> 212 / ° F Degrees
Flash point	> 212 / ° F Degrees
Evaporation rate	No Information available
Flammability (solid, gas)	No Information available
Upper flammability limit:	No Information available
Lower flammability limit:	No Information available
Vapor pressure	No Information available
Vapor density	No Information available
Bulk Density Lbs/Gal	No Information available
Water solubility	Complete
Partition Coefficient (n-octanol/water)	No Information available
Autoignition temperature	No Information available
Decomposition temperature	No Information available
VOC Content (%)	No Information available

10. STABILITY AND REACTIVITY

Reactivity
No data available

Chemical stability
Stable under recommended storage conditions.

Possibility of Hazardous Reactions
None under normal processing.

Conditions to avoid
Extremes of temperature and direct sunlight.

Incompatible materials
None known based on information supplied.

Hazardous Decomposition Products
None known based on information supplied.

11. TOXICOLOGICAL INFORMATION

Information on likely routes of exposure

Product Information No data available

Inhalation No data available.

Eye contact No data available.

Skin Contact No data available.

Ingestion No data available.

Chemical Name	Oral LD50	Dermal LD50	Inhalation LC50
Sodium Carbonate 497-19-8	= 4090 mg/kg (Rat)	-	= 2300 mg/m³ (Rat) 2 h

Information on toxicological effects

Symptoms No Information available.

Delayed and immediate effects as well as chronic effects from short and long-term exposure

Sensitization	No Information available.
Germ cell mutagenicity	No Information available.
Carcinogenicity	No Information available.
Reproductive toxicity	No Information available.
STOT - single exposure	No Information available.
STOT - repeated exposure	No Information available.
Aspiration hazard	No Information available.

Numerical measures of toxicity - Product Information

Unknown Acute Toxicity 0.05% of the mixture consists of ingredient(s) of unknown toxicity.
This is based upon values calculated per chapter 3.1 of the GHS document.

12. ECOLOGICAL INFORMATION

Ecotoxicity

0.05% of the mixture consists of components(s) of unknown hazards to the aquatic environment

Chemical Name	Algae/aquatic plants	Fish	Crustacea
PROPRIETARY	-	LC50 Oncorhynchus mykiss, 96 hr.,1.2 mg/L:	LC50 Daphnia sp., 48 hr., 5.3 mg/L
Sodium Carbonate 497-19-8	EC 50 Nitzschia sp.,120 hr.,242 mg/L	LC 50 Lepomis macrochirus, 96 hr., 300 mg/L static LC50 Pimephales promelas, 96 hr., 310 - 1220 mg/L., static	EC50 Daphnia magna, 48 hr., 265 mg/L

Persistence and degradability
No Information available.

Bioaccumulation
No Information available.

Other adverse effects No Information available.

13. DISPOSAL CONSIDERATIONS

Waste treatment methods

Disposal of wastes Disposal should be in accordance with applicable regional, national and local laws and regulations.

Contaminated packaging Do not reuse container.

This product contains one or more substances that are listed with the State of California as a hazardous waste.

Chemical Name	California Hazardous Waste Status
Sodium Carbonate 497-19-8	Corrosive

14. TRANSPORT INFORMATION

The shipping classification information in this section (Section 14) is meant as a guide to the overall classification of the product. However, transportation classifications may be subject to change with changes in package size. Consult shipper requirements under 49 CFR, IATA and IMDG to assure regulatory compliance.

DOT Not regulated

15. REGULATORY INFORMATION

MICHELS®

POTENTIAL ADDITIVIVE

PLUGZ IT

© Copyright, Michels Directional Crossings, a Division of Michels Corporation, 2020

WYO-BEN, INC.

SAFETY DATA SHEET

SECTION 1 — CHEMICAL PRODUCT AND COMPANY IDENTIFICATION

Product Trade Name:	**PLUGZ-IT™ MAX**
Chemical Family:	Mineral
Application:	Sealing
Manufacturer/Supplier:	Wyo-Ben, Inc. 1345 Discovery Drive Billings, MT 59102 USA Telephone: 800.548.7055 Facsimile: 406.656.0748
Emergency Phone Number	CHEMTREC® 800.424.9300

SECTION 2 — HAZARD IDENTIFICATION

Hazard Symbol: Health Hazard

Signal Word: Warning

Hazard Overview:

ACUTE HEALTH HAZARD
May cause eye and respiratory irritation.

CHRONIC HEALTH HAZARD
Breathing crystalline silica can cause lung disease, including silicosis and lung cancer.

SECTION 3 — COMPOSITION/INFORMATION ON INGREDIENTS

Substances	CAS Number	Percent	ACGIH TLV-TWA	OSHA PEL-TWA*
Crystalline Silica, quartz	14808-60-7	1 – 6%	0.025 mg/m^3	$\frac{10\ mg/m^3}{\%SiO2 + 2}$

*More restrictive exposure limits may be enforced by some states, agencies, or other authorities.
Non-hazardous components > 94%

SECTION 4 — FIRST AID MEASURES

Inhalation:	If inhaled, remove to a dust free area. Get medical attention if respiratory irritation develops or if breathing becomes difficult. Inhalation may aggravate existing respiratory illness.
Skin:	Wash with soap and water until clear. Seek medical attention if irritation persists.
Eyes:	In case of contact, immediately flush eyes with plenty of water for at least 15 minutes and get medical attention if irritation persists.
Ingestion:	No adverse effects.
Notes to Physician:	Treat Symptomatically.

SECTION 5 — FIRE FIGHTING MEASURES

Flash Point/Range (F):	Not applicable
Flash Point/Range (C):	Not applicable
Flash Point Method:	Not applicable
Autoignition Temperature (F):	Not applicable
Autoignition Temperature (C):	Not applicable
Flammability Limits in Air – Lower (%):	Not applicable
Flammability Limits in Air – Upper (%):	Not applicable
Fire Extinguishing Media:	All standard firefighting media. (Caution slippery when wet.)
Special Exposure Hazards:	Not applicable
Special Protective Equipment for Firefighters:	Not applicable
NFPA Ratings:	Health 0, Flammability 0, Reactivity 0

SECTION 6 — ACCIDENTAL RELEASE MEASURES

Personal Precautionary Measures:	Use appropriate protective equipment. Avoid creating and breathing dust.
Environmental Precautionary Measures:	None known.
Procedure for Cleaning/Absorption:	Collect using appropriate dustless method and hold for appropriate disposal.

SECTION 7 — HANDLING AND STORAGE

Handling Precautions:	This product contains quartz which may become airborne. Avoid breathing dust. Avoid creating dusty conditions. Use only with adequate ventilation to keep exposure below recommended exposure limits. Wear a NIOSH/MSHA European Standard En 149, or equivalent certified for silica bearing dust, respirator when using this product. Material is slippery when wet. Promptly clean up spills to avoid breathing airborne dust.
Storage Information:	Use good housekeeping in storage and work areas to prevent accumulation of dust. Close container when not in use. Do not reuse empty container.

SECTION 8 — EXPOSURE CONTROLS/PERSONAL PROTECTION

Engineering Controls:	Use approved industrial ventilation and local exhaust as required to maintain exposures below applicable exposure limits.
Personal Protective Equipment:	If engineering controls and work practices cannot prevent excessive exposures, the selection and proper use of personal protective equipment should be determined by an industrial hygienist or other qualified professional based on the specific application of this product.
Respiratory Protection:	Not normally needed. If significant exposures are possible use NIOSH/MSH respirator approved for silica bearing dust.
Hand Protection:	Normal work gloves.
Skin Protection:	Wear clothing appropriate for the work environment. Dusty clothing should be laundered before reuse. Use precautionary measures to avoid creating dust when removing or laundering clothing.
Eye Protection:	Wear safety glasses or goggles to protect against exposure.
Other Precautions:	None known.

SECTION 9 — PHYSICAL AND CHEMICAL PROPERTIES

Physical State:	Solid
Color:	Light tan to gray as dry powder
Odor:	Odorless
pH:	8 – 10 (5% aqueous solution)
Specific Gravity @ 20 C (Water=1):	2.45 – 2.55
Density @ 20 C (lbs/gallon):	Not determined
Bulk Density @ 20 C (lbs/ft^3):	60 – 66
Boiling Point/Range (F):	Not applicable
Boiling Point/Range (C):	Not applicable
Freezing Point/Range (F):	Not applicable
Freezing Point/Range (C):	Not applicable
Vapor Pressure @ 20 C (mmHg):	Not applicable
Vapor Density (Air=1):	Not applicable
Percent Volatiles:	Not applicable
Evaporation Rate (Butyl Acetate=1):	Not applicable
Solubility in Water (g/100ml):	Insoluble, forms colloidal suspension
Solubility in Solvents (g/100ml):	Not applicable
VOCs (lbs/gallon):	Not applicable
Viscosity, Dynamic @ 20 C (centipoise):	240
Viscosity, Kinematic @ 20 C (centistrokes):	Not applicable
Partition Coefficient/n-Octanol/Water:	Not applicable
Molecular Weight (g/mole):	Not applicable

SECTION 10 — STABILITY AND REACTIVITY

Stability Data:	Stable
Hazardous Polymerization:	Will Not Occur
Conditions to Avoid:	None anticipated
Incompatibility (Materials to Avoid):	Hydrofluoric Acid
Hazardous Decomposition Products:	None
Additional Guidelines:	Not applicable

SECTION 11 — TOXICOLOGICAL INFORMATION

Principle Route of Exposure:	Eye or skin contact, inhalation.
Inhalation:	Inhaled crystalline silica in the form or quartz from occupational sources is carcinogenic to humans (IARC, Group 1).
Skin Contact:	May cause mechanical skin irritation.
Eye Contact:	May cause eye irritation.
Ingestion:	None known
Aggravated Medical Conditions:	Individuals with respiratory disease, including but not limited to asthma and bronchitis, or subject to eye irritation, should not be exposed to respirable quartz-bearing dust.
Chronic Effects/Carcinogenicity:	Silicosis: Excessive inhalation of respirable crystalline silica dust may cause a progressive, disabling, and sometimes-fatal lung disease called silicosis. Symptoms include cough, shortness of breath, wheezing, non-specific chest illness, and reduced pulmonary function. This disease is exacerbated by smoking. Individuals with silicosis are predisposed to develop tuberculosis. Cancer Status: The International Agency for Research on Cancer (IARC, 1997) concludes that there is sufficient evidence in humans for carcinogenicity of inhaled crystalline silica from occupational sources (IARC Group 1), that carcinogenicity was not detected in all industrial circumstances studied and that carcinogenicity may depend on characteristics of the crystalline silica or on external factors affecting its biological activity. See IARC Monograph 68, Silica, Some Silicates and Organic Fibres (June 1997). The National Toxicology Program (NTP) classifies respirable crystalline silica as "Known to be a human carcinogen" (NTP 9th Report on Carcinogens, 2000). The American Conference of Governmental Industrial Hygienists (ACGIH) classifies crystalline silica, quartz, as a suspected human carcinogen (A2).
Other Information:	See "Adverse Effects of Crystalline Silica Exposure" published by the American Thoracic Society Medical Section of the American Lung Association, American Journal of Respiratory and Critical Care Medicine, Volume 155, pages 761-768 (1997).
Toxicity Tests	
Oral Toxicity:	Not determined (on FDA GRAS list; used as a food additive)
Dermal Toxicity:	Not determined (on FDA GRAS list; used in cosmetic preparations)
Inhalation Toxicity:	Not determined
Primary Irritation Effect:	Not determined
Carcinogenicity:	Refer to IARC Monograph 68, Silica, Some Silicates and Organic Fibres (June 1997).
Genotoxicity:	Not determined
Reproductive/Developmental Toxicity:	Not determined

SECTION 12 — ECOLOGICAL INFORMATION

Mobility (Water/Soil/Air):	Not determined
Persistence/Degradability:	Not determined
Bio-accumulation:	Not determined

Ecotoxicological Information

Acute Fish Toxicity:	Not determined
Acute Crustaceans Toxicity:	Not determined
Acute Algae Toxicity:	Not determined

Chemical Fate Information:	Not determined
Other Information:	Not applicable

SECTION 13 — DISPOSAL CONSIDERATIONS

Disposal Method:	Bury in a licensed landfill according to federal, state and local regulations.
Contaminated Packaging:	Follow all applicable national or local regulations.

SECTION 14 — TRANSPORT INFORMATION

Land Transportation

DOT – Not Restricted
Canadian TDG – Not Restricted
ADR – Not Restricted

Air Transportation

ICAO/IATA – Not Restricted

Sea Transportation

IMDG – Not Restricted

Other Transportation Information

Labels: None

SECTION 15 — REGULATORY INFORMATION

US Regulations

US TSCA Inventory	All components listed on inventory or are exempt.
EPA SARA Title III Extremely Hazardous Substances	Not applicable
EPA SARA (311, 312) Hazard Class	Acute Health Hazard Chronic Health Hazard
EPA SARA (313) Chemicals	This product does not contain a toxic chemical for routine annual “Toxic Chemical Release Reporting” under Section 313 (40 CFR 372).

EPA CERCLA/Superfund Reportable Spill Quantity	Not applicable
EPA RCRA Hazardous Waste Classification	If product becomes a waste, it does NOT meet the criteria of a hazardous waste as defined by the US EPA.
California Proposition 65	This product contains crystalline silica (respirable) which is a substance known to the State of California to cause cancer.

Canadian Regulations

Canadian DSL Inventory	All components listed on inventory are exempt.
WHMIS Hazard Class	This product contains crystalline silica (respirable) and is classified as a Class D, Division 2, Subdivision A substance.

SECTION 16 — OTHER INFORMATION

Prepared	03/18/2015
Last Revision	07/23/2015

DISCLAIMER

All information presented herein is believed to be accurate; however, it is the user's responsibility to determine in advance of need that the information is current and suitable for their circumstances. No warranty or guarantee, expressed or implied is made by WYO-BEN, INC. as to this information, or as to the safety, toxicity or effect of the use of this product.

MATERIAL SAFETY DATA SHEET

1. Product and Company Identification

Material name CLAY CUTTER™

Version # 05

Revision date 19-December-2008

Chemical name Formation Inhibitor

Chemical description Liquid

CAS # Mixture

Manufacturer

CETCO
Drilling Products Group
2870 Forbs Avenue
Hoffman Estates, IL 60192 US
safetydata@amcol.com
http://www.cetco.com/
General Information (800) 527-9948
CHEMTREC® (800) 424-9300

2. Hazards Identification

Emergency overview No hazards resulting from the material as supplied. Health injuries are not known or expected under normal use.

OSHA regulatory status While this material is not considered hazardous by the OSHA Hazard Communication Standard (29 CFR 1910.1200), this MSDS contains valuable information critical to the safe handling and proper use of the product. This MSDS should be retained and available for employees and other users of this product.

Potential health effects

Eyes Contact with eyes may cause irritation.

Skin May cause skin irritation in susceptible persons.

Inhalation Health injuries are not known or expected under normal use.

Ingestion Ingestion of this product may cause nausea, vomiting and diarrhea.

3. Composition / Information on Ingredients

The manufacturer lists no ingredients as hazardous according to OSHA 29 CFR 1910.1200.

Composition comments This product is not considered to be a carcinogen by IARC, ACGIH, NTP, or OSHA.

4. First Aid Measures

First aid procedures

Eye contact Immediately flush eyes with plenty of water for at least 15 minutes. Get medical attention if irritation develops or persists.

Skin contact Wash off with soap and water. Remove contaminated clothing. Get medical attention if irritation develops or persists.

Inhalation Remove to fresh air. If the affected person is not breathing, apply artificial respiration. If breathing is difficult, give oxygen. Get medical attention, if needed.

Ingestion Give victim water or milk. If swallowed, do NOT induce vomiting. Never give anything by mouth to an unconscious person. Obtain medical attention.

General advice If you feel unwell, seek medical advice (show the label where possible).

5. Fire Fighting Measures

Flammable properties Not a fire hazard.

Extinguishing media

Suitable extinguishing media Use any media suitable for the surrounding fires.

Protection of firefighters

Protective equipment and precautions for firefighters	Move containers from fire area if you can do it without risk. Cool containers with flooding quantities of water until well after fire is out.
Hazardous combustion products	None known.

6. Accidental Release Measures

Environmental precautions	Prevent spreading over a wide area (e.g. by containment or oil barriers). Prevent further leakage or spillage if safe to do so. Do not flush into surface water or sanitary sewer system.
Methods for containment	Stop the flow of material, if this is without risk. Dike the spilled material, where this is possible.
Methods for cleaning up	Absorb spill with inert material (e.g., dry sand or earth), then place in a chemical waste container. Do not allow the spilled product to enter public drainage system or open water courses. Wear appropriate protective equipment and clothing during clean-up.

7. Handling and Storage

Handling	Use only in well-ventilated areas. Provide sufficient air exchange and/or exhaust in work rooms. In case of insufficient ventilation, wear suitable respiratory equipment.
Storage	Keep containers tightly closed in a dry, cool and well-ventilated place. Store in original container.

8. Exposure Controls / Personal Protection

Engineering controls	Good general ventilation should be sufficient to control airborne levels. Local exhaust is suggested for use, where possible, in enclosed or confined spaces. Facilities storing or utilizing this material should be equipped with an eyewash facility and a safety shower.

Personal protective equipment

Eye / face protection	Wear safety glasses; chemical goggles (if splashing is possible).
Skin protection	Wear appropriate chemical resistant gloves. Use of an impervious apron is recommended.
Respiratory protection	None required where adequate ventilation conditions exist.
General hygeine considerations	Use good industrial hygiene practices in handling this material. Wash hands before breaks and immediately after handling the product.

9. Physical & Chemical Properties

Appearance	Not available.
Color	Not available.
Odor	Not available.
Odor threshold	Not available.
Physical state	Liquid.
Form	Liquid.
pH	Not available.
Melting point	Not available.
Freezing point	Not available.
Boiling point	Not available.
Flash point	Not available.
Evaporation rate	Not available.
Flammability	Not available.
Flammability limits in air, upper, % by volume	Not available.
Flammability limits in air, lower, % by volume	Not available.
Vapor pressure	Not available.
Vapor density	Not Determined
Specific gravity	Not available.
Relative density	Not available.
Solubility (water)	Not available.

Partition coefficient (n-octanol/water)	Not available.
Auto-ignition temperature	Not available.
Decomposition temperature	Not available.
Percent volatile	50 % v/v

10. Chemical Stability & Reactivity Information

Chemical stability	No hazards to be especially mentioned. Stable at normal conditions.
Conditions to avoid	None known.
Incompatible materials	None known.
Hazardous decomposition products	Upon decomposition, this product may yield gaseous nitrogen oxides, carbon monoxide, carbon dioxide and/or low molecular weight hydrocarbons.
Possibility of hazardous reactions	Will not occur.

11. Toxicological Information

Component analysis - LD50	This product is judged to have an acute oral LD50 (rat) greater than 5 g/kg of body weight, and ar acute dermal LD50 (rabbit) greater than 3.16 g/kg of body weight.
Further information	This product has no known adverse effect on human health.

12. Ecological Information

Ecotoxicity	This material is not expected to be harmful to aquatic life. This material has a biodegradatior percentage of 85.2% and is considered to have ready biodegradability. This material exceeds the OECD Guideline 301B for environmental friendliness
Environmental effects	Ecological injuries are not known or expected under normal use.
Persistence and degradability	Not available.

13. Disposal Considerations

Disposal instructions	Dispose in accordance with all applicable regulations.

14. Transport Information

DOT

Not regulated as dangerous goods.

IATA

Not regulated as dangerous goods.

IMDG

Not regulated as dangerous goods.

15. Regulatory Information

US federal regulations	OSHA Process Safety Standard: This material is not known to be hazardous by the OSHA Highly Hazardous Process Safety Standard, 29 CFR 1910.119.

CERCLA (Superfund) reportable quantity

None

Superfund Amendments and Reauthorization Act of 1986 (SARA)

Hazard categories	Immediate Hazard - No Delayed Hazard - No Fire Hazard - No Pressure Hazard - No Reactivity Hazard - No
Section 302 extremely hazardous substance	No
Section 311 hazardous chemical	No

Inventory status

Country(s) or region	Inventory name	On inventory (yes/no)*
Australia	Australian Inventory of Chemical Substances (AICS)	No

Country(s) or region	Inventory name	On inventory (yes/no)*
Canada	Domestic Substances List (DSL)	No
Canada	Non-Domestic Substances List (NDSL)	No
China	Inventory of Existing Chemical Substances in China (IECSC)	No
Europe	European Inventory of New and Existing Chemicals (EINECS)	No
Europe	European List of Notified Chemical Substances (ELINCS)	No
Japan	Inventory of Existing and New Chemical Substances (ENCS)	No
Korea	Existing Chemicals List (ECL)	No
New Zealand	New Zealand Inventory	No
Philippines	Philippine Inventory of Chemicals and Chemical Substances (PICCS)	No
United States & Puerto Rico	Toxic Substances Control Act (TSCA) Inventory	No

A "Yes" indicates that all components of this product comply with the inventory requirements administered by the governing country(s)

State regulations This product does not contain a chemical known to the State of California to cause cancer, birth defects or other reproductive harm.

16. Other Information

Further information This safety datasheet only contains information relating to safety and does not replace any product information or product specification.

HMIS ratings

NFPA ratings Health: 0
Flammability: 0
Instability: 0

Disclaimer The information provided in this Safety Data Sheet is correct to the best of our knowledge, information and belief at the date of its publication. The manufacturer expressly does not make any representations, warranties, or guarantees as to its accuracy, reliability or completeness nor assumes any liability, for its use. It is the user's responsibility to verify the suitability and completeness of such information for each particular use.

Third party materials: Insofar as materials not manufactured or supplied by this manufacturer are used in conjunction with, or instead of this product, it is the responsibility of the customer to obtain, from the manufacturer or supplier, all technical data and other properties relating to these and other materials and to obtain all necessary information relating to them. No liability can be accepted in respect of the use of this product in conjunction with materials from another supplier.

MICHELS®

POTENTIAL ADDITIVIVE

CLAY BREAKER

© Copyright, Michels Directional Crossings, a Division of Michels Corporation, 2020

1. CHEMICAL PRODUCT AND COMPANY IDENTIFICATION

TRADE NAME: ClayBreaker

24-HOUR EMERGENCY TELEPHONE: 1-800-535-5053 (Infotrac)

SUPPLIER: DCS Fluids Solutions LP
P.O. Box 1027
Graham, TX 76450
(940) 521-0400

Product Use: Well Stimulation Additive, Clay Stabilizer
CAS #: Mixture

2. COMPOSITION, INFORMATION ON INGREDIENTS

No hazardous ingredients as defined by OSHA 29 CFR 1910.1200

3. HAZARD IDENTIFICATION

EMERGENCY OVERVIEW: Colorless to amber liquid with a strong odor. May be irritating to eyes, skin and respiratory tract. May be harmful if swallowed. Avoid contact with skin, eyes and clothing.

POTENTIAL HEALTH HAZARDS:

- **INHALATION:** May cause irritation of respiratory tract.
- **INGESTION:** May cause irritation of the gastrointestinal tract including nausea, vomiting and diarrhea.
- **SKIN:** May cause skin irritation.
- **EYES:** May cause eye irritation.

CHRONIC EFFECTS: None known

Ingredients found on one of the OSHA designated carcinogen lists are listed below.

No ingredients listed in this section.

4. FIRST AID MEASURES

INHALATION: If breathing is difficult, remove to fresh air and keep at rest in a comfortable position for breathing. Obtain immediate medical attention.

INGESTION: If swallowed, seek immediate medical attention and show this container or label. Do not induce vomiting without medical advice.

SKIN: Wash skin thoroughly with soap and water. Remove contaminated clothing. Get medical attention if any irritation continues.

EYES: Immediately flush eyes with large quantities of water for at least 15 minutes. Hold eyelids apart to ensure complete irrigation of all eye and lid tissue. Get medical attention if irritation develops.

ADVICE TO PHYSICIANS: No specific treatment. Treat according to symptoms present.

5. FIRE FIGHTING MEASURES

FLASH POINT: >200° F (>93.3° C)
FLAMMABLE LIMITS: LEL: N/A
UEL: N/A

EXTINGUISHING AGENTS:

Water, dry chemical, CO2, water spray or regular foam.
Do not use a solid water stream as it may scatter and spread fire.

SPECIAL FIRE FIGHTING PROCEDURES:

Wear positive-pressure, self-contained breathing apparatus (SCBA) and protective fire fighting clothing (including fire fighting helmet, coat, pants, boots, and gloves). If protective equipment is not available or not used, fight fire from a protected location or safe distance.

UNUSUAL FIRE & EXPLOSION HAZARDS:

Always stay away from tanks engulfed in flame. Withdraw immediately in case of rising sound from venting safety devices of any discoloration of tanks due to fire. Move containers from fire area if you can do it without risk. Do not scatter spilled material with high pressure water streams. Use water spray to cool unopened containers. Cool containers with flooding quantities of water until well after fire is out.

6. ACCIDENTAL RELEASE MEASURE

PERSONAL PROTECTION:

Don appropriate personal protective equipment prior to entering spill/leak area.
(See Section 8)

SPILL CLEAN-UP PROCEDURES:

Limit access to area, as necessary. Shut off leak if it can be done safely. Contain spill with dike. Prevent run-off into sewers or waterways. Pump large spills into salvage containers. Soak up residue and small spills with vermiculite, paper, clay or other absorbent material. Remove affected soils. Place in salvage containers. Continue to observe handling precautions.

WASTE DISPOSAL METHOD:

Follow approved local beneficial reuse guidelines for uncontaminated spent drilling fluids. If contaminated, dispose of in a licensed industrial landfill according to local, state and federal regulations. If released to the environment for other than its intended purpose, this product, in its current state, does not meet the definition of a hazardous waste under 40 CFR 261.

7. HANDLING AND STORAGE

HANDLING PRECAUTIONS:

Always wear recommended personal protection equipment. Do not get in eyes, on skin or clothing. Avoid breathing mist or vapor. Use only with adequate ventilation or wear respiratory protection.

STORAGE PRECAUTIONS:

Keep containers tightly closed and properly labeled. Store at moderate temperatures in dry, well-ventilated area. Keep container closed when not in use. Keep in original container. Store containers in upright position. Since emptied containers retain product residue, follow hazard precautions even when empty.

HYGIENIC WORK PRACTICES:

Use good personal hygiene practices. Wash hands and skin thoroughly after handling. Promptly remove contaminated clothing and wash before reuse. Emergency eye wash fountains and safety showers should be available in the immediate vicinity of any potential exposure.

8. EXPOSURE CONTROLS AND PERSONAL PROTECTION

ENGINEERING CONTROLS:

There are no occupational exposure limits established at this time. Since this material may be irritating to skin and mucous membranes, general room ventilation plus local exhaust at points of emission should be used to maintain levels of airborne contaminants as low as feasibly possible.

PERSONAL PROTECTION EQUIPMENT

RESPIRATORY:

Respiratory protection is not required under normal use. Wear a NIOSH/MSHA approved respirator following manufacturer's recommendations where airborne contaminants may occur.

EYE / FACE PROTECTION:

Wear chemical safety goggles or face shield to protect against splashing.

SKIN PROTECTION:

Chemical resistant gloves and splash aprons made of impermeable material should be worn.

9. PHYSICAL AND CHEMICAL PROPERTIES

- **Appearance and Odor:** Colorless to amber liquid with strong odor.
- **Physical State:** Liquid
- **pH:** 6.5 – 9
- **Vapor Pressure:** Not determined
- **Vapor Density:** Not determined
- **Boiling Point:** Not determined
- **Melting Point:** 469.4° F estimated
- **Solubility in Water:** Complete
- **Specific Gravity:** 1.01 – 1.03

10. STABILITY AND REACTIVITY

CHEMICAL STABILITY: Stable at normal conditions**.**

CONDITIONS TO AVOID: Heat, flames and sparks.

MATERIALS TO AVOID: Strong acids.

HAZARDOUS DECOMPOSITION PRODUCTS: None expected.

HAZARDOUS POLYMERIZATION: Does not occur.

11. TOXICOLOGICAL INFORMATION

ACUTE EFFECTS:

Acute LD50: 400 – 4000 mg/kg, Rat, Oral
Acute LC50: > 4000 mg/kg, Rat, Dermal

Not expected to be hazardous by OSHA criteria.

CHRONIC EFFECTS:

None known. Not expected to be hazardous by OSHA criteria.
This product has no known adverse effect on human health.

12. ECOLOGICAL INFORMATION

ENVIRONMENTAL INFORMATION:

ClayBreaker has a biodegradation percentage of 85.2% and is considered to have ready biodegradability. Test of ready biodegradability are stringent tests that provide limited opportunity for acclimation and biodegradation to occur. A positive result in a test of ready biodegradability is an indication that the test substance will undergo rapid and ultimate biodegradation in the environment. OECD Guideline 301B has set the standard for ready biodegradability at 60%. ClayBreaker exceeds this standard for environmental friendliness.

13. DISPOSAL CONSIDERATIONS

Follow approved local beneficial reuse guidelines for uncontaminated spent drilling fluids. If contaminated, dispose of in a licensed industrial landfill according to local, state and federal regulations. If released to the environment for other than its intended purpose, this product does not meet, in its present state, the definition of a hazardous waste under 40 CFR 261. Under RCRA, it is the responsibility of the user of the product to determine, at the time of disposal, whether the product meets RCRA criteria for a hazardous waste. Dispose in accordance with all applicable regulations.

14. TRANSPORTATION INFORMATION

U.S. DEPARTMENT OF TRANSPORTATION (DOT):

Not regulated as dangerous goods.

CANADIAN TRANSPORTATION OF DANGEROUS GOODS (TDG):

Not regulated as dangerous goods.

IMDG:

Not regulated as dangerous goods.

IATA:

Not regulated as dangerous goods.

15. REGULATORY INFORMATION

OSHA: This product is not a "Hazardous Chemical" as defined by the OSHA Hazard Communication Standard, 29 CFR 1910.1200. We request that you make all information in the Material Safety Data Sheet available to your employees.

TSCA: Not on inventory.

SARA TITLE III/CERCLA:

To aid our customers in complying with regulatory requirements, SARA Title III Hazard Categories for this product are indicated below. If the word "YES" appears next to any category, this product may be reportable by you under the requirements of 40 CFR Part 370. Please consult those regulations for details.

Immediate (Acute) Health:	YES
Delayed (Chronic) Health:	NO
Fire Hazard:	NO
Reactive Hazard:	NO
Sudden Release of Pressure:	NO

Reportable Quantity: Not reportable

Spills/release resulting in the loss of any ingredient at or above its RQ requires immediate notification to the National Response Center (1-800-424-8802) and to your Local Emergency Planning Committee.

16. OTHER INFORMATION

HMIS RATINGS: HEALTH (1) FLAMMABILITY (0) PHYSICAL HAZARD (0)
Based on the NPCA HMIS III rating system.

CURRENT ISSUE DATE: August 1, 2014
Updated information on LD50 and LC50.

DCS Fluid Solutions LP believes the information contained in this material safety data sheet is accurate based on the information supplied by reputable suppliers of our raw materials. We cannot make any assertions as to its reliability or completeness; therefore, the user may rely on it only at user's risk. We have made no effort to censor or conceal deleterious aspects of this product. Since we cannot anticipate or control the conditions under which this information and product may be used, we make no guarantee that the precautions we have suggested will be adequate for all individuals and/or situations. It is the obligation of each user of this product to comply with the requirements of all applicable laws regarding use and disposal of this product. Neither warranty, either expressed or implied, nor liability of any nature with respect to this product or to the data herein is made or incurred hereunder.

MATERIAL SAFETY DATA SHEET

5/04/04

1. PRODUCT AND COMPANY IDENTIFICATION

Product Name: TorqBreaker™
Chemical Family: Surfactant
Supplier: DCS Fluid Solutions.
PO Box1027
Graham TX 76450
940-521-0500

2. COMPOSITION/INFORMATION ON INGREDIENTS

OSHA Regulated Components: None

3. HAZARDS IDENTIFICATION

Acute Health Effects: None
Chronic Health Effects: None
Carcinogen: No

PRIMARY ENTRY ROUTES:

1) Skin and Eyes: Repeated contact with the skin may be irritating. Eye contact may be irritating.
2) Ingestion: May be harmful.
3) Inhalation: Not considered a hazard.

4. FIRST AID MEASURES

SKIN CONTACT: Remove contaminated clothing without delay. Wash skin thoroughly with water. If irritation persists, get medical attention.
EYE CONTACT: Rinse thoroughly with plenty of water for 15 minutes. In case of persistent eye irritation, consult a physician.
INGESTION: Give large volumes of water. Do not induce vomiting. Get medical attention.
INHALATION: N/A

5. FIRE FIGHTING MEASURES

FLASH POINT: None (will not burn)
EXTINGUISHING MEDIA: N/A
FIRE FIGHTING PROCEDURES: N/A

UNUSUAL FIRE AND EXPLOSION HAZARD: Fire fighters should observe all precautions that apply to any fire where chemicals are stored.

6. ACCIDENTAL RELEASE MEASURES

If product leaks or spills, flood area with water. Mop up and dispose to sanitary sewer. Adhere to all Federal, State and Local Regulations.

7. HANDLING AND STORAGE

Store containers tightly closed and in an upright position.
Do not destroy or deface the label.

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

Food, beverages and tobacco products should not be carried, stored or consumed where this material is in use. Before eating, drinking or smoking, wash face and hands with soap and water. Avoid skin contact. Protective clothing such as impervious gloves are recommended to prevent skin contact. For operations where eye or face contact can occur, wear eye protection such as chemical splash proof goggles or face shield.

9. PHYSICAL AND CHEMICAL PROPERTIES

Physical State:	Viscous Liquid
Color:	Red
Odor:	Slight Citrus
Solubility:	Completely soluble in water
Specific Gravity:	1.035
pH	10.0
Freezing Point:	N/A
Flash Point:	None (will not burn)
Vapor Pressure	N/A

10. STABILITY AND REACTIVITY

STABILITY: Stable Conditions to Avoid: None known
POLYMERIZATION: Will not occur. Conditions to Avoid: None known

11. TOXICOLOGICAL INFORMATION

None Available

12. ECOLOGICAL INFORMATION

None Available

13. DISPOSAL INFORMATION

If released into the environment for other than its intended purpose, this product does not meet the definition of a hazardous waste under 40 CFR 261. Follow approved local beneficial reuse guidelines for uncontaminated spent drilling fluids. If contaminated, dispose of in a licensed industrial landfill according to local, state and federal regulations..Recover and reuse if possible.

14. TRANSPORT INFORMATION

SHIPPING NAME: Not applicable/Not Regulated
HAZARD CLASS: Not applicable
UN NUMBER: Not applicable
DOT HAZARDOUS SUBSTANCES: Not applicable
TRANSPORT LABEL: None Required

15. REGULATORY INFORMATION

US TSCA: All components of this product are included on the TSCA Inventory in compliance with the Toxic Substances Control Act, 15 U.S.C. 2601

SECTION 313 SUPPLIER NOTIFICATION (SARA): This product contains the following toxic chemicals subject to the reporting requirements of Section 313 of the Emergency Planning and Community Right to Know Act of 1986 and of 40 CFR 372: None.

BHS Marketing

Western Briquette

BALLBUSTER

MATERIAL SAFETY DATA SHEET

Sodium Acid Pyrophosphate

Date: June 20, 2001

I Company Identification

Company Name:	BHS Marketing / Western Briquette
Mailing Address:	P.O. Box 27955 SLC, UT 84127-0955
Physical Address:	2320 West Indiana Ave. SLC, UT 84104
Telephone:	(801) 973-8232
Fax:	(801) 973-8838
Emergency Number:	Chemtrec (800) 424-9300

II Product Identification

Product Name:	Sodium Acid Pyrophosphate, SAPP, Disodium pyrophosphate
Chemical Formula:	$Na_2H_2P_2O_7$
Molecular Weight:	221.96
CAS Number:	7758-16-9

III Typical Physical Properties

Physical Appearance:	White powder
Odor:	Odorless
Bulk Density:	0.9 kg/l approx.
pH (1% aqueous solution):	3.7-4.4
Melting Point:	Decomposes at 220°C
Solubility in Water:	approx. 13g in 100g water, room temperature
Vapor Pressure:	Negligible

IV Reactivity Data

Chemical Stability:	Stable
Materials to Avoid:	Avoid contact with strong bases

V Toxicological Information

Toxicity:	Oral-rat LD-50: > 1000 mg/kg

VI Hazard Data

Acute	
Eye Contact:	Causes irritation
Skin Contact:	Causes irritation
Ingestion:	Causes irritation
Inhalation:	Causes irritation
Symptoms of Overexposure:	Irritant to eyes, skin and respiratory systems. Ingestion can cause vomiting and diarrhea

VII Recommended First Aid Measures

General First Aid:	Remove the person from source of exposure. Wash with plenty of water. Upon ingestion, if the person is conscious, cause him/her to vomit. Get medical attention

VIII Fire Fighting Measures

Flash Point:	Not flammable
Extinguishing Media:	Not combustible
Special Firefighting Procedures:	Protective clothing and self contained breathing apparatus

IX Accidental Release Measures

Clean up & Disposal of Spills:	Spillage or leakages are cleaned up by mechanical removal, if possible. Flushing with plenty of water

X Handling & Storage

Handling:	Avoid inhalation, contact with eyes, skin or clothing. Do not ingest
Storage:	Store in a cool, well ventilated, dry place, in tightly closed containers

XI Exposure Controls/ Personal Protection

Appropriate Hygienic Practices:	As part of good industrial, personal hygiene and safety procedure, avoid all unnecessary exposure to the product and ensure prompt removal from eyes, skin and clothing. Maintain good housekeeping to control dust accumulations.

Personal Protection Equipment

Eye Protection:	Use safety glasses
Skin Protection:	Wear protective clothing, gloves and dust respirator if necessary
Ventilation Protection:	Adequate ventilation

XII Additional Information

The information in this MSDS was obtained from sources, which we believe are reliable. However, the information is provided without any warranty, expressed or implied, regarding its correctness.

The conditions or methods of handling, storage, use and disposal are beyond our control and may be beyond our knowledge. For this and other reasons, we do not assume responsibility and expressly disclaim liability for loss, damage, or expense arising out of or in any way connected with handling, storage, use or disposal of the product.

Emergency Response Information Provider: CHEMTREC

Within the United States Emergency Telephone Number: 1-800-424-9300

Outside the United States / International Emergency Telephone Number: +1-703-527-3887

2 HAZARD(S) IDENTIFICATION

2.1 CLASSIFICATION OF THE SUBSTANCE OR MIXTURE

GHS Classification in accordance with 29 CFR 1910 (OSHA HazCom Standard):

Eye Irritation (Category 2A), H319

For the full text of the H-Statements mentioned in this Section, see Section 16.

2.2 GHS LABEL ELEMENTS, INCLUDING PRECAUTIONARY STATEMENTS

Pictograms:

Irritant

Signal Word: Warning

Hazard Statement(s):

H319 Causes serious eye irritation.

Precautionary Statement(s):

P264 Wash skin thoroughly after handling.

P280 Wear eye protection / face protection.

P305 + P351 + P338 IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing.

P337 + P313 If eye irritation persists: Get medical advice / attention.

2.3 HAZARDS NOT OTHERWISE CLASSIFIED OR NOT COVERED BY GHS

None

3 COMPOSITION / INFORMATION ON INGREDIENTS

3.1 SUBSTANCES

Synonyms:	Soda Ash, Sodium Carbonate, Carbonic Acid Sodium Salt
Formula:	Na_2CO_3

Molecular Weight: 105.99 g/mol

Component (REACH Registration)	CAS # / EC #	Concentration	Classifications	Remark
Sodium carbonate (01-2119485498-19-0011)	CAS #: 497-19-8 EC #: 207-838-8	≥ 99%	Eye Irrit. 2A, H319	Mono-constituent

* For the full text of the H-Statements mentioned in this Section, see Section 16.

4 FIRST-AID MEASURES

4.1 DESCRIPTION OF FIRST-AID MEASURES

General - Check the vital functions. Unconscious: maintain adequate airway and respiration. Respiratory arrest: artificial respiration or oxygen. Cardiac arrest: perform resuscitation. Victim conscious with labored breathing: half-seated. Victim in shock: on his back with legs slightly raised. Vomiting: prevent asphyxia/aspiration pneumonia. Prevent cooling by covering the victim (no warming up). Keep watching the victim. Give psychological aid. Keep the victim calm, avoid physical strain. Depending on the victim's condition: doctor/hospital.

After inhalation - Remove the victim into fresh air. Respiratory problems: consult a doctor/medical service.

After skin contact - Rinse with water. Soap may be used. Do not apply (chemical) neutralizing agents. Take victim to a doctor if irritation persists.

After eye contact - Rinse immediately with plenty of water for at least 15 minutes. Do not apply neutralizing agents. Take victim to an ophthalmologist if irritation persists.

After ingestion - Rinse mouth with water. Immediately after ingestion: give lots of water to drink. Do not induce vomiting. Consult a doctor/medical service if victim is unwell.

4.2 MOST IMPORTANT SYMPTOMS AND EFFECTS, BOTH ACUTE AND DELAYED

4.2.1 Acute Symptoms

If inhaled - Dry/sore throat. Coughing. Slight irritation. Exposure to high concentrations: Irritation of the respiratory tract. Irritation of the nasal mucous membranes. Respiratory difficulties.

In case of skin contact - Not irritating

In case of eye contact - Inflammation/damage of the eye tissue. Corrosion of the eye tissue. Lacrimation.

If swallowed – After absorption of high quantities: Nausea. Vomiting. Abdominal pain. Irritation of the gastric/intestinal mucosa.

4.2.2 Delayed Symptoms

No effects known.

4.3 INDICATION OF ANY IMMEDIATE MEDICAL ATTENTION AND SPECIAL TREATMENT NEEDED

No data available.

5 Fire-Fighting Measures

5.1 Extinguishing Media

Use water spray, alcohol-resistant foam, dry chemical or carbon dioxide.

5.2 Special hazards arising from the substance or mixture

Upon combustion CO and CO2 are formed. Reacts on exposure to water with some metals. CO2 generation occurs when mixed with acidic materials.

5.3 Advice for firefighters

Wear self-contained breathing apparatus for firefighting if necessary.

5.4 Special protective equipment for firefighters

Gloves. Safety glasses. Protective clothing. Dust cloud protection and heat/fire exposure: Compressed air respirator.

6 Accidental Release Measures

6.1 Personal Precautions, Protective Equipment and Emergency Procedures

Use personal protective equipment. Avoid dust formation. Avoid breathing vapors, mist or gas. Ensure adequate ventilation. Evacuate personnel to safe areas. Avoid breathing dust. For personal protection see section 8.

6.2 Environmental precautions

Contain released substance, pump into suitable containers. Plug the leak, cut off the supply. Knock down/dilute dust cloud with water spray. Violent exothermic reaction with some acids; release of harmful gases/vapors (carbon dioxide). Carbon dioxide is heavier than air and will collect in ducts, drains and low lying areas. Prevent spreading in sewers.

6.3 Methods and material for containment and cleaning up

Prevent dust cloud formation. Scoop solid spill material into closed containers. Carefully collect the spill. Clean contaminated surfaces with an excess of water. Wash clothing and equipment after handling.

6.4 Reference to other sections

For disposal see section 13.

7 HANDLING AND STORAGE

7.1 PRECAUTIONS FOR SAFE HANDLING

Avoid contact with skin and eyes. Use air conveying/mechanical systems for bulk transfer to storage. Provide appropriate exhaust ventilation at places where dust is formed. In case of insufficient ventilation, wear suitable respiratory equipment if release of airborne dust is expected.

7.2 CONDITIONS FOR SAFE STORAGE, INCLUDING ANY INCOMPATIBILITIES

Store in original container. Keep in properly labeled containers. Keep container tightly closed.

7.3 SUITABLE PACKAGING MATERIAL

No data available

7.4 INCOMPATIBLE PRODUCTS

Aluminum, powdered aluminum, and acids.

8 EXPOSURE CONTROLS / PERSONAL PROTECTION

8.1 COMPONENTS WITH WORKPLACE CONTROL PARAMETERS

Contains no substances with occupational exposure limit values.

8.2 EXPOSURE CONTROLS

Appropriate engineering controls – Avoid formation of dust. Keep away from ignition sources. Keep container tightly closed. Handle in accordance with good industrial hygiene and safety practice. Wash hands before breaks and at the end of workday.

8.3 PERSONAL PROTECTIVE EQUIPMENT

Eye / Face Protection - Safety glasses with side shields or protective goggles. Use equipment for eye protection tested and approved under appropriate government standards such as NIOSH (US) or EN 166(EU).

Skin protection - Handle with gloves, butyl rubber or PVC, which have good resistance. Gloves must be inspected prior to use. Use proper glove removal technique to avoid skin contact with product. Dispose of contaminated gloves after use in accordance with applicable laws and good laboratory practices. Wash and dry hands.

Body Protection – Protective clothing. The type of protective equipment must be selected according to the concentration and amount of the dangerous substance at the specific workplace.

Respiratory protection – For nuisance exposures use type P95 (US) or type P1 (EU EN 143) particle respirator. For higher level protection use type OV/AG/P99 (US) or type ABEK-P2 (EU EN 143) respirator cartridges. Use respirators and components tested and approved under appropriate government standards such as NIOSH (US) or CEN (EU).

8.4 CONTROL OF ENVIRONMENTAL EXPOSURE

Prevent leakage or spillage if safe to do so. Do not let product enter drains. See section 6.2, 6.3, and 13.

9 PHYSICAL AND CHEMICAL PROPERTIES

9.1 INFORMATION ON BASIC PHYSICAL AND CHEMICAL PROPERTIES

Appearance Form:	Crystalline Solid / Crystalline Powder / Grains / Lumps
Color:	Colorless
Odor:	Odorless
Odor Threshold:	No data available
Particle Size:	694 µm
pH:	11.6; 5.0%
Melting Point / Freezing Point:	851 °C / 1,564 °F
Boiling Point	1,600 °C / 2,912 °F
Flash Point:	No data available
Explosion Limits:	No data available
Evaporation Rate:	No data available
Flammability:	Non Combustible
Log Kow:	-6.19 Estimated value
Viscosity:	No data available
Vapor Pressure:	No data available
Vapor Density:	No data available
Solubility water:	212.5 g/l; 20 °C / 68 °F
Relative Density:	2.52 -253; 20 °C / 68 °F
Absolute Density:	2,530 kg/m^3
Decomposition temperature:	>1600 °C / >2912 °F
Auto-ignition temperature:	>400 °C / >752 °F
Explosive Properties:	No data available
Oxidizing Properties:	No data available

9.2 PHYSICAL HAZARDS

No data available

10 STABILITY AND REACTIVITY

10.1 REACTIVITY

None under normal use conditions.

10.2 CHEMICAL STABILITY

Stable. Decomposes by reaction with strong acid.

10.3 POSSIBILITY OF HAZARDOUS REACTIONS

None under normal processing.

10.4 CONDITIONS TO AVOID

Exposure to air or moisture over prolonged periods.

10.5 INCOMPATIBLE MATERIALS

Aluminum, powdered aluminum, and acids.

10.6 HAZARDOUS POLYMERIZATION

Hazardous polymerization does not occur.

---

11 TOXICOLOGICAL INFORMATION

11.1 INFORMATION ON TOXICOLOGICAL EFFECTS

11.1.1 Acute toxicity

LD50 Oral - rat – 2,800 mg/kg
LD50 Dermal – rabbit >2,000 mg/kg
LD50 Inhalation - rat – 2.30 mg/l, 2 hour exposure time

11.1.2 Corrosion / irritation

Skin - rabbit
Result: Mild skin irritation – 24 hours

11.1.3 Serious eye damage / eye irritation

Eyes - rabbit
Result: Severe eye irritation – 24 hours

11.1.4 Respiratory or skin sensitization

Inhalation - no data available
Skin Sensitization: no data available

11.1.5 Germ cell mutagenicity

No data available

11.1.6 Carcinogenicity

No data available

11.1.7 Reproductive toxicity

No data available

11.1.8 Specific target organ toxicity - single exposure

No data available

11.1.9 Specific target organ toxicity - repeated exposure

No data available

11.1.10 Chronic effects from short and long-term exposure

On continuous / repeated exposure / contact: Red skin. Dry skin. Tingling / irritation of the skin. Affection of the nasal septum.

12 ECOLOGICAL INFORMATION

12.1 TOXICITY

	Parameter	Method	Value	Duration	Species	Test design	Fresh / salt water	Value determination
Acute toxicity fishes	LC50	Other	300 mg/l	96 h	Lepomis macrohirus	Static system	Fresh water	Experimental value
Acute toxicity invertebrates	EC50	Other	200 - 227 mg/l	48 h	Ceriodaphnia sp.	Semi-static	Fresh water	Experimental value
Toxicity algae and other aquatic plants	EC50		242 mg/l	5 days	Algae			Experimental value

12.2 PERSISTENCE AND DEGRADABILITY:

Biodegradability: not applicable

12.3 BIOACCUMULATIVE POTENTIAL:

Low potential for bioaccumulation (Log Know <4)

12.4 MOBILITY IN SOIL:

Low potential for absorption in soil.

12.5 RESULTS OF PBT AND VPVB ASSESSMENT:

PBT/vPvB assessment not available as chemical safety assessment is not required/not conducted.

12.6 OTHER ADVERSE EFFECTS:

No data available

13 DISPOSAL CONSIDERATIONS

13.1 WASTE DISPOSAL

Remove waste in accordance with local and/or national regulations. Contact a licensed professional waste disposal service to dispose of this material. Different types of hazardous waste should not be mixed together if it will entail a risk of pollution or create problems for the further management of the waste. Hazardous waste shall be managed responsibly. Do not discharge into drains.

Component (REACH Registration)	CAS #	Concentration	Classifications	Remark
Sodium Carbonate (01-2119485498-19-0011)	CAS #: 497-19-8	≥ 99%	Eye Irrit. 2A, H319	Monoconstituent

* For the full text of the H-Statements mentioned in this Section, see Section 16.

4 FIRST-AID MEASURES

4.1 DESCRIPTION OF FIRST-AID MEASURES

General - Check the vital functions. Unconscious: maintain adequate airway and respiration. Respiratory arrest: artificial respiration or oxygen. Cardiac arrest: perform resuscitation. Victim conscious with labored breathing: half-seated. Victim in shock: on his back with legs slightly raised. Vomiting: prevent asphyxia/aspiration pneumonia. Prevent cooling by covering the victim (no warming up). Keep watching the victim. Give psychological aid. Keep the victim calm, avoid physical strain. Depending on the victim's condition: doctor/hospital.

After inhalation - Remove the victim into fresh air. Respiratory problems: consult a doctor/medical service.

After skin contact - Rinse with water. Soap may be used. Do not apply (chemical) neutralizing agents. Take victim to a doctor if irritation persists.

After eye contact - Rinse immediately with plenty of water for at least 15 minutes. Do not apply neutralizing agents. Take victim to an ophthalmologist if irritation persists.

After ingestion - Rinse mouth with water. Immediately after ingestion: give lots of water to drink. Do not induce vomiting. Consult a doctor/medical service if victim is unwell.

4.2 MOST IMPORTANT SYMPTOMS AND EFFECTS, BOTH ACUTE AND DELAYED

4.2.1 Acute Symptoms

If inhaled - Dry/sore throat. Coughing. Slight irritation. Exposure to high concentrations: Irritation of the respiratory tract. Irritation of the nasal mucous membranes. Respiratory difficulties.

In case of skin contact - Not irritating

In case of eye contact - Inflammation/damage of the eye tissue. Corrosion of the eye tissue. Lacrimation.
If swallowed – After absorption of high quantities: Nausea. Vomiting. Abdominal pain. Irritation of the gastric/intestinal mucosa.

4.2.2 Delayed Symptoms

No effects known.

4.3 INDICATION OF ANY IMMEDIATE MEDICAL ATTENTION AND SPECIAL TREATMENT NEEDED

No data available.

5 FIRE-FIGHTING MEASURES

5.1 EXTINGUISHING MEDIA

Use water spray, alcohol-resistant foam, dry chemical or carbon dioxide.

5.2 SPECIAL HAZARDS ARISING FROM THE SUBSTANCE OR MIXTURE

Upon combustion CO and CO2 are formed. Reacts on exposure to water with some metals. CO2 generation occurs when mixed with acidic materials.

5.3 ADVICE FOR FIREFIGHTERS

Wear self-contained breathing apparatus for firefighting if necessary.

5.4 SPECIAL PROTECTIVE EQUIPMENT FOR FIREFIGHTERS

Gloves. Safety glasses. Protective clothing. Dust cloud protection and heat/fire exposure: Compressed air respirator.

6 ACCIDENTAL RELEASE MEASURES

6.1 PERSONAL PRECAUTIONS, PROTECTIVE EQUIPMENT AND EMERGENCY PROCEDURES

Use personal protective equipment. Avoid dust formation. Avoid breathing vapors, mist or gas. Ensure adequate ventilation. Evacuate personnel to safe areas. Avoid breathing dust. For personal protection see section 8.

6.2 ENVIRONMENTAL PRECAUTIONS

Contain released substance, pump into suitable containers. Plug the leak, cut off the supply. Knock down/dilute dust cloud with water spray. Violent exothermic reaction with some acids; release of harmful gases/vapors (carbon dioxide). Carbon dioxide is heavier than air and will collect in ducts, drains and low-lying areas. Prevent spreading in sewers.

6.3 METHODS AND MATERIAL FOR CONTAINMENT AND CLEANING UP

Prevent dust cloud formation. Scoop solid spill material into closed containers. Carefully collect the spill. Clean contaminated surfaces with an excess of water. Wash clothing and equipment after handling.

6.4 REFERENCE TO OTHER SECTIONS

For disposal see section 13.

7 HANDLING AND STORAGE

7.1 PRECAUTIONS FOR SAFE HANDLING

Avoid contact with skin and eyes. Use air conveying/mechanical systems for bulk transfer to storage. Provide appropriate exhaust ventilation at places where dust is formed. In case of insufficient ventilation, wear suitable respiratory equipment if release of airborne dust is expected.

7.2 CONDITIONS FOR SAFE STORAGE, INCLUDING ANY INCOMPATIBILITIES

Store in original container. Keep in properly labeled containers. Keep container tightly closed.

7.3. SUITABLE PACKAGING MATERIAL

No data available.

7.4 INCOMPATIBLE PRODUCTS

Aluminum, powdered aluminum, and acids.

8 EXPOSURE CONTROLS / PERSONAL PROTECTION

8.1 COMPONENTS WITH WORKPLACE CONTROL PARAMETERS

Contains no substances with occupational exposure limit values.

8.2 EXPOSURE CONTROLS

Appropriate engineering controls – Avoid formation of dust. Keep away from ignition sources. Keep container tightly closed. Handle in accordance with good industrial hygiene and safety practice. Wash hands before breaks and at the end of workday.

8.3 PERSONAL PROTECTIVE EQUIPMENT

Eye / Face Protection - Safety glasses with side shields or protective goggles. Use equipment for eye protection tested and approved under appropriate government standards such as NIOSH (US) or EN 166(EU).

Skin Protection - Handle with gloves, butyl rubber or PVC, which have good resistance. Gloves must be inspected prior to use. Use proper glove removal technique to avoid skin contact with product. Dispose of contaminated gloves after use in accordance with applicable laws and good laboratory practices. Wash and dry hands.

Body Protection – Protective clothing. The type of protective equipment must be selected according to the concentration and amount of the dangerous substance at the specific workplace.

Respiratory Protection – For nuisance exposures use type P95 (US) or type P1 (EU EN 143) particle respirator. For higher level protection use type OV/AG/P99 (US) or type ABEK-P2 (EU EN 143) respirator cartridges. Use respirators and components tested and approved under appropriate government standards such as NIOSH (US) or CEN (EU).

8.4 CONTROL OF ENVIRONMENTAL EXPOSURE

Prevent leakage or spillage if safe to do so. Do not let product enter drains. See section 6.2, 6.3, and 13.

9 PHYSICAL AND CHEMICAL PROPERTIES

9.1 INFORMATION ON BASIC PHYSICAL AND CHEMICAL PROPERTIES

Appearance Form:	Crystalline Solid / Crystalline Powder / Grains / Lumps
Color:	Colorless
Odor:	Odorless
Odor Threshold:	No data available

9.2 PHYSICAL HAZARDS
No data available.

10 STABILITY AND REACTIVITY

10.1 REACTIVITY
None under normal use conditions.

10.2 CHEMICAL STABILITY
Stable. Decomposes by reaction with strong acid.

10.3 POSSIBILITY OF HAZARDOUS REACTIONS
None under normal processing.

10.4 CONDITIONS TO AVOID
Exposure to air or moisture over prolonged periods.

10.5 INCOMPATIBLE MATERIALS
Aluminum, powdered aluminum, and acids.

10.6 HAZARDOUS POLYMERIZATION
Hazardous polymerization does not occur.

11 TOXICOLOGICAL INFORMATION

11.1 INFORMATION ON TOXICOLOGICAL EFFECTS

11.1.1 Acute toxicity
LD50 Oral - rat – 2,800 mg/kg
LD50 Dermal - rabbit >2,000 mg/kg
LD50 Inhalation - rat – 2.30 mg/l, 2-hour exposure time

11.1.2 Corrosion/irritation
Skin - rabbit
Result: Mild skin irritation – 24 hours

11.1.3 Serious eye damage/eye irritation
Eyes - rabbit
Result: Severe eye irritation – 24 hours

11.1.4 Respiratory or skin sensitization
Inhalation - no data available
Skin Sensitization: no data available

11.1.5 Germ cell mutagenicity
No data available

11.1.6 Carcinogenicity
No data available

11.1.7 Reproductive toxicity
No data available

11.1.8 Specific target organ toxicity - single exposure
No data available

11.1.9 Specific target organ toxicity - repeated exposure
No data available

11.1.10 Chronic effects from short and long-term exposure
On continuous / repeated exposure / contact: Red skin. Dry skin. Tingling / irritation of the skin. Affection of the nasal septum.

12 ECOLOGOCAL INFORMATION

12.1 TOXICITY

	Parameter	Method	Value	Duration	Species	Test Design	Fresh/Salt Water	Value Determination
Acute toxicity fishes	LC50 Other	Other	300 mg/l	96 h	Lepomis macronhirus	Static system	Fresh water	Experimental value

2.1. CLASSIFICATION OF THE SUBSTANCE OR MIXTURE

According with the version of the Globally Harmonized system of Classification and labeling adopted in the United states and Regulation 1272/2008/EC [CLP]: Eyes irritant category 2(H319)

Safety Data Sheet

CITRIC ACID FCC/USP PWD

2.2 LABEL ELEMENTS

GHS07

Signal word:
Warning

Hazard Statement:
Causes serious eye irritation. H319

Precautionary Statement:
Wash hands thoroughly after handling. P264
Wear eye protection. P280

Precautionary Statement. IF IN EYES: P305
Response :
Rinse cautiously with water for several minutes. P351
Remove contact lenses, if present and easy to do Continue rinsing. P338
If eye irritation persists: P337
Get medical advice/attention. P313

2.3. OTHER HAZARDS
FIRE AND EXPLOSION HAZARD:
May form combustible dust concentrations in air. Possibility of dust explosion. it is recommended that all dust control equipment and material transport systems involved are engineered to prevent conditions contributing to dust explosions. Do not allow dust to accumulate on flat surfaces, on rafters or building structural components. Keep away from all ignition sources including heat, sparks and flame.

SECTION 3:COMPOSITION/INFORMATION OF INGREDIENTS

- Chemical name Citric acid - Food grade

Safety Data Sheet

CITRIC ACID FCC/USP PWD

- CAS number	77-92-9
- EINECS number	201-069-1
- Synonyms	2 - Hydroxy -1,2,3 propanetricarboxylic acid Acidulant - Citric acid - food additive E330.

SECTION 4:FIRST AID MEASURES

4.1 DESCRIPTION OF FIRST AID MEASURES

- General advise	Seek medical attention if irritation develops after first aid application
- Inhalation	Move people from the exposure to fresh air.
- Skin contact	Wash skin with soap and water.
- Eye contact	Remove particulates by irrigating with eye wash solution or clean water, holding eyelids apart.
- Ingestion	Wash mouth and flush throat upto the stomach.

4.2 MOST IMPORTANT SYMPTOMS AND EFFECTS, BOTH ACUTE AND DELAYED
ROUTE(S) OF ENTRY: Skin Contact; Eye Contact
HUMAN EFFECTS AND SYMPTOMS OF OVEREXPOSURE:
ACUTE SKIN CONTACT: This product is irritating to the skin resulting in reddening, stinging, and swelling.
ACUTE EYE CONTACT: This product is irritating to the eyes resulting in stinging, reddening, tearing, and swelling.
CHRONIC EFFECTS OF EXPOSURE: No applicable information was found concerning any adverse chronic health effects from overexposure to this product.
CARCINOGENICITY: The components of this product are not listed by NTP, IARC or regulated as a carcinogen by OSHA.
MEDICAL CONDITIONS
AGGRAVATED BY EXPOSURE: Persons with pre-existing eye or skin disorders may be more susceptible to the effects of this product.

4.3 INDICATION OF ANY IMMEDIATE MEDICAL ATTENTION AND SPECIAL TREATMENT NEEDED.
None Anticipated

SECTION 5: FIRE-FIGHTING MEASURES

5.1 EXTINGUISHING MEDIA
Water spray, dry powder, carbon dioxide or media appropriate for surrounding fire. Use of water jet may cause explosive dust conditions.

Safety Data Sheet

CITRIC ACID FCC/USP PWD

5.2 SPECIFIC HAZARDS
FIRE AND EXPLOSION HAZARD: Possibility of dust explosion. It is recommended that all dust control equipment and material transport systems involved are engineered to prevent conditions contributing to dust explosions. Do not allow dust to accumulate on flat surfaces, on rafters or building structural components. Use of water jet may cause explosive dust conditions.
SEE NFPA 61, Standard for the prevention of Fire and Dust Explosions in Agricultural and Food Processing Facilities, 2008 or later Edition, and other related standards.

5.3 SPECIFIC PROTECTIVE EQUIPMENT AND PRECAUTIONS FOR FIRE-FIGHTERS
Wear self-contained breathing apparatus and full protective gear. Use water spray to cool fire exposed containers.

FLAMMABILITY CLASS (OSHA)
Not applicable

HAZARDOUS COMBUSTION PRODUCTS
Carbon dioxide and carbon monoxide

SECTION 6:ACCIDENTAL RELEASE MEASURES

6.1 PERSONAL PRECAUTIONS
Use personal protective equipment. Wear eye protection. Avoid contact with skin and eyes.

6.2 ENVIRONMENTAL PRECAUTIONS
Prevent further leakage or spillage if safe to do so. No special environmental precautions required

6.3 METHODS FOR CLEANING UP
Vacuum or sweep spills. Minimize dust generation.
If washing down spilled area is necessary, use copious amounts of water and control runoff.
Follow local, state and federal regulations for product disposal

6.4 REFERENCE TO OTHER SECTIONS
See Section 7 for information on safe handling
See Section 8 for information on personal protection equipment
See Section 13 for disposal information

SECTION 7: HANDLING AND STORAGE

Safety Data Sheet

CITRIC ACID FCC/USP PWD

7.1 PRECAUTIONS FOR SAFE HANDLING
See NFPA 61, Standard for the Prevention of Fire and Dust Explosions in Agricultural and Food Processing Facilities, 2008 Edition, and other related standards. Use with adequate ventilation. Minimize dust generation and accumulation; dust deposits should not be allowed to accumulate on surfaces, as these may form an explosive mixture if they are disturbed.

All dust control equipment and material transport systems involved are engineered to prevent conditions contributing to dust explosions and may require explosion relief vents or an explosion suppression system or an oxygen-deficient environment. Bonding and grounding systems may be required.

Dust-handling systems (such as exhaust ducts, dust collectors, vessels, and processing equipment) should be designed to limit or prevent leakage of dust into the work area.

Do not allow dust to accumulate on flat surfaces, on rafters or building structural components. Routine housekeeping should be instituted to reduce dust accumulation. Use Avoid dispersal of dust in the air; use vacuum or wet sweeping methods. Do not use compressed air to clean surfaces.

Keep away from all ignition sources including heat, sparks, and flame. Where dust accumulations occur use non-sparking tools.

7.2 CONDITIONS OF SAFE STORAGE, INCLUDING ANY INCOMPATIBILITIES
Store in a cool dry place. Store in a tightly closed container/bag.
The packaging material should have reasonable moisture and air barriers and comply with food regulations.
7.3 SPECIFIC END USE(S)
See overview of the exposure scenario and summary of risk management measures in Appendix 1

SECTION 8: EXPOSURE CONTROLS / PERSONAL PROTECTION

8.1 CONTROL PARAMETERS
Exposure limits: Nuisance dust (also called particulate not otherwise regulated (PNOR)).
OSHA PEL: 15 mg/ mg/m3 Total dust
5 mg/m3 Respirable dust
ACGIH TLV: 10 mg/m3 Inhalable dust
5 mg/m3 Respirable dust
15 mg/m3 Total dust

Safety Data Sheet

CITRIC ACID FCC/USP PWD

8.2 EXPOSURE CONTROLS
APPROPRIATE ENGINEERING CONTROLS:
Ventilation: See NFPA 61, Standard for the Prevention of Fire and Dust Explosions in Agricultural and Food Processing Facilities, 2008 Edition, and National Fire Protection Association 650, Standard for Pneumatic Conveying Systems for Handling Combustible Materials, 1997 Edition and other related standards. Normal industrial hygiene measures should be sufficient for protection of employees from exposure to dusts. Local and mechanical exhaust is desirable when dumping bags.

APPROPRIATE PERSONAL PROTECTIVE EQUIPMENT:
Eye protection: Safety glasses are recommended. Safety goggles are desirable when dumping bags.
Emergency wash facilities: Eye wash is recommended for conditions where dust generation is likely.
Special protective clothing: Not normally required.
Gloves: Not normally required. Use ordinary work gloves if dust dries skin.
Respirator: NIOSH approved N-95 dust respirator if working in situations that could generate large amounts of airborne dust.

FOR FIREFIGHTING AND OTHER IMMEDIATELY DANGEROUS TO LIFE OR HEALTH CONDITIONS:
See section 5.

SECTION 9: PHYSICAL AND CHEMICAL PROPERTIES

9.1 INFORMATION ON BASIC PHYSICAL AND CHEMICAL PROPERTIES

- Physical form	Solid
- Color	White to off-white
- Odor	Essentially odorless to very slight sugar odor
- pH (concentration)	NA
- Boiling point	104°C (219 °F)
- Flash point	345°C
- Melting/freezing point	approx. 153°C at 1,013 hPa
- Decomposition temperature	NA
- Auto-ignition temperature	NA
- Explosion properties	NA
- Oxidising properties	NA
- Vapour pressure	2.21*10-6 Pa at 25°C
- Vapor density	0.62 (Air = 1)
- Relative density	1.665at 20°C

Safety Data Sheet

CITRIC ACID FCC/USP PWD

- Bulk density	Not Established
- Specific gravity	15 °C (1.24 at 59 °F)
- Viscosity	Not Established
- Water solubility	590 g/L at 20°C
- Solubility (non aqueous)	Methyl alcohol: completely miscible
- Partition coefficient	In OCTANOL/ WATER (log value): Log Kow: -0.2 to -1.8
- Dissociation constant	pKa: 3.13, 4.76 and 6.4 at 25°
- Evaporation rate	Less than 1 (Butyl acetate =1)

9.2 OTHER INFORMATION

SECTION 10: STABILITY AND REACTIVITY

10.1 REACTIVITY
Stable

10.2 CHEMICAL STABILITY
Stable under normal conditions.
Polymerization will not occur.

10.3 POSSIBILITY OF HAZARDOUS REACTIONS
Not applicable

10.4 CONDITIONS TO AVOID
Practices which produce dust or disperse finely divided dust in air.
See NFPA 61. Standard for the Prevention of Fire and Dust Explosions in Agricultural and Food Processing Facilities, 2008 Edition, and other related standards.

10.5 INCOMPATIBLE MATERIALS
Oxidizing agents, strong acids

10.6 Hazardous decomposition products:
Nothing unusual

SECTION 11: TOXICOLOGICAL INFORMATION

11.1 INFORMATION ON TOXICOLOGICAL EFFECTS

- Inhalation	ORAL: LD50: 5400 – 5790 mg/kg bw (mouse) / LD50: 11700 mg/kg bw (rat) DERMAL: LD50 >2000 mg/kg bw rat
- Ingestion	No effects known or anticipated.

Safety Data Sheet

CITRIC ACID FCC/USP PWD

- Skin irritation / corrosion	Sustained exposure in a dusty manufacturing environment may result in mechanical irritation in the creases of the skin, particularly at the fingers, or other drying effects. no health effects known or anticipated.
- Eye irritation	Irritating to eyes.
- Skin sensitisation	Not sensitizing
- Chronic toxicity	Not known or anticipated
- Genetic toxicity	Not known or anticipated
- Carcinogenicity	Not classifiable as Carcinogen.
- Reprotoxicity	Not known or anticipated
- Specific effects	Not applicable

SECTION 12: ECOLOGICAL INFORMATION

12.1 TOXICITY
LC50 for freshwater fish: 440 mg/l
EC50/LC50 for freshwater invertebrates: 1535 mg/l.

12.2 PERSISTENCE/DEGRADABILITY
Ready biodegradable

12.3 BIOACCUMULATIVE POTENTIAL
Log Kow <3, not bioaccumulative

12.4 MOBILITY IN SOIL
Not applicable

12.5 BPT, vPvB
The substance does not meet the criteria for PBT or vPvB.

12.6 OTHER ADVERSE EFFECTS
None known

SECTION 13: DISPOSAL CONSIDERATIONS

13.1 WASTE TREATMENT METHODS
Follow local, state and federal regulations for product disposal. Not a hazardous waste unless contaminated with hazardous products.

SECTION 14: TRANSPORTATION INFORMATION

Safety Data Sheet

CITRIC ACID FCC/USP PWD

International regulations (RID/ADR; RTMDR; IMDG; IATA/OACI): Not classified as dangerous for transport.
DOT shipping label: Non-hazardous

SECTION 15: REGULATORY INFORMATION

15.1 SAFETY, HEALTH AND ENVIRONMENTAL REGULATIONS
According with the version of the Globally Harmonized System of Classification and labeling adopted in the United States and Regulation 1272/2008/EC(CLP): Classified

15.2 CHEMICAL SAFETY ASSESSMENT
US FEDERAL REGULATIONS:
Clean Air Act:
ODS: Not applicable.
SARA (EPCRA) Section 313 (40 C.F.R. § 372.65): Not applicable.
TSCA Status: On TSCA inventory.

STATE REPORTING REQUIREMENTS:
California Proposition 65: Not applicable.

SECTION 16: OTHER INFORMATION

See Hazard Communication Guidance for Combustible Dusts, OSHA 3371-08 2009, U.S. Occupational Safety and Health Administration, https://www.osha.gov/Publications/3371combustible-dust.html (accessed 10/8/14)
And
NFPA 654, Standard for the Prevention of Fire and Dust Explosions from the Manufacturing, Processing, and Handling of Combustible Particulate Solids, for general safe handling and design guidance.

Other classifications of the substance:
TSCA STATUS: On TSCA Inventory.
FDA STATUS: Citrus acid, Anhydrous complies with FDA Regulation 21 C.F.R. § 184.1033;
CALIFORNIA PROPOSITION 65: Not applicable.
HMIS rating:
Health: 1
Flammable: 0

Safety Data Sheet

CITRIC ACID FCC/USP PWD

Reactivity: 0
(0 = minimal ; 1 = slight ; 2 = moderate ; 3 = serious ; 4 = severe)

Safety Data Sheet according to Commission Regulation (EU) No 453/2010 of 20 May 2010 amending Regulation (EC) No 1907/2006 of the European Parliament and of the Council on the Registration, Evaluation, Authorization and Restriction of Chemicals (REACH)

DISCLAIMER OF LIABILITY

The information in this SDS is collected from reliable sources. However, the information is provided without any warranty, expressed or implied. The conditions or methods of handling, storage, use or disposal of the product might be beyond our control and knowledge. For the avoidance of doubt, we shall in no such circumstances be under any liability in respect of loss, damage or expenses arising from handling, storage, use or disposal of the product by your company and/or your subcontractors. This SDS is only applicable for the product mentioned in the identification chapter and title. If the product is used as a component in another product, this SDS may not be applicable on the composite material.

Annex I

SUMMARY OF RISK MANAGEMENT MEASURES
Safe use has been demonstrated by calculation of risk characterisation ratios where appropriate, while qualitative considerations were stipulated where quantification was not possible. The risk characterisation is based on the following risk management measures:
Exposure scenario ,,Description ,,General measures ,,Specific Human Health risk management measures ,,Specific Environment risk management measures ,,
ES1 ,,Production and intermediate use on production sites ,,Good working practices, containment and safe handling in line with industry best practice. ,,(i) Local Exhaust ventilation (LEV)
(ii) Personal Protective Equipment (PPE): Working clothing, protective gloves and safety glasses. Dust masks in areas where dust may be present. In case of open handling of larger quantities or accidental release, a particle mask or respirator with independent air supply is recommended. ,,(i) Treatment of effluent in waste water treatment plant. ,,
ES2, 3, 4, 5, 6, 7, 8, 9, 11, 12, 13, 14, 15, 16, 17 ,,Industrial use ,,
Good working practices, containment and safe handling in line with industry best practice. ,,(i) Local Exhaust ventilation (LEV) if
aerosol mists or dusts are present.
(ii) Personal Protective Equipment (PPE): Working clothing, protective gloves and safety glasses. Dust masks in areas where dust may be present. In case of open handling of larger quantities or accidental release, a particle mask or respirator with independent air supply is

Safety Data Sheet

CITRIC ACID FCC/USP PWD

recommended. ,,(i) Treatment of effluent in waste water treatment plant. ,,
ES10 ,,Textile industry ,,Good working practices, containment and safe handling in line with industry best practice. ,,(i) Local Exhaust ventilation (LEV) if aerosol mists or dusts are present.
(ii) Personal Protective Equipment (PPE): Working clothing, ,,(i) Treatment of effluent in waste water treatment plant.
(ii) No direct discharge into the marine environment ,,

DOWNHOLE TOOLS/REAMERS

© Copyright, Michels Directional Crossings, a Division of Michels Corporation, 2018

Reaming Tools/Equipment

The reamers utilized for hole-opening operations are custom fabricated by Michels Corporation, however equivalent or better tools may be substituted depending on availability of other suppliers' products, or, if changes in anticipated drilling conditions are encountered. Michels R&D program for downhole tools includes monitoring of performance & longevity of reaming equipment in differing soil conditions throughout North America as well as foreign destinations. Utilizing the latest technology, tooling and materials available to the industry is a continuing goal of Michels.

There is essentially no limit to the length of time these tools can be run since simple repairs can be made in the field to keep the reamers in good working condition. The condition of the reamers will depend on the type of ground encountered; typically these reamers are discarded when they are observed to be beyond field repair. Initial maximum run time for specific reamers recommended by Michels is 50-100 hours.

DRILL FLUID RECYCLING
MUD CLEANING EQUIPMENT

© Copyright, Michels Directional Crossings, a Division of Michels Corporation, 2018

Drill Mud Cleaning and Disposal

The first phase of the mud cleaning system is displacement of solid returns at the shakers. Heavy solids are sifted out by a shaker with screens and deposited into a pit. From here they will be transported by dump truck to a site for disposal.

Drill Mud Cleaning Equipment Specifications

Volume of Mixing/Scalper Tank	54.0-Bbls
Volume of Desander Tank	72.0-Bbls
Volume of Desilter Tank	72.0-Bbls
Quantity of Scalping Shakers	1.0-Shakers
Mesh Size of Scalping Shakers	10-20 Double Stacked
Desander Capability	2 @ 500-GPM (1,000 GPM Total)
Desander Cones	2.0-Cones
Desander Mesh Size	40 to 165
Quantity of Desilter Cones	10 Ea @ 100-GPM
Desilter Mesh Size	60 to 250
Steel Mud Circulating Tank Volume	160-Bbls
Returns Tank Volume (Mud Pit)	320-Bbls
Cuttings Tank Volume (20-yd Roll-off)	150-Bbls
Mud Screening, Max Pass Size	40 Mesh

Due to the quantity and types of mud pumps owned by Michels and located on multiple drill sites Michels utilizes one of the following pumps based on availability and geographic location:

Bentonite Pump Capabilities (ENTRY/EXIT)

Name Brand	Gardner Denver OPI-350
Liner Size	6-Inches
Maximum Pressure	1,469 PSI
Maximum Flow Rate	529 GPM
Gallons Per Stroke	2.94 Gallons Per Stroke

Proprietary to Michels

Bentonite Pump Capabilities (ENTRY/EXIT SIDE)

Name Brand..... Ellis Williams W-446 Super Force Triplex Piston Model

Liner Size..... 6-Inches

Maximum Pressure..... 1,027 PSI

Maximum Flow Rate..... 661 GPM

Gallons Per Stroke..... 2.20 Gallons Per Stroke

Bentonite Pump Capabilities (ENTRY/EXIT SIDE)

Name Brand..... Gardner Denver OPI-700

Liner Size..... 7-Inches

Maximum Pressure..... 1,690 PSI

Maximum Flow Rate..... 599 GPM

Gallons Per Stroke..... 3.99 Gallons Per Stroke

Proprietary to Michels

MICHELS ROLLERS

© Copyright, Michels Directional Crossings, a Division of Michels Corporation, 2018

Michels Directional Crossings Pipeline Rollers

General Description: Steel tubing welded frame supporting two urethane coated rollers. Pillow block bearings are used to mount the rollers. The rollers are opposed to each other and set @ 125° to accommodate various pipe sizes.

Size: Footprint of 50”x48” with overall height of 40”

Load Capacity: 167,000 Lbs per assembly

Shafts: Material is steel 4140, 2-15/16 Diameter.

Frame: Frame weldment made of steel ASTM A-500 Grade square tubing

Rollers: 11” O.D., 20” face width, 8-5/8” core size. Coating is urethane approximately 1” thick (95 Shore-A)

Bearings: 4-required per assembly, 2 on each coated roller. Manufacturer is Linkbelt, Part Number PB22447E w/ 2-15/16” spherical roller, self aligning, contact seal.

Load Capacity for Bearings;

Basic = 41,800 Lbs
Static = 71,500 Lbs,
L-10 Life = 9,410 Hours @ 300 RPM

DIRECTIONAL DRILL CONTINGENCY PLANS

WBI

Lake Sakakawea Crossing

Proprietary Michels

MICHELS®

Horizontal Directional Drilling

CONTINGENCY PLANS

Michels believes contingency planning begins with the appointment of competent field personnel having the greatest amount of experience to complete a project. Michels' personnel are some of the most qualified drilling experts in the industry, as demonstrated by resumes and experience lists highlighting past projects completed. With the abundant resources at their disposal, Michels has overcome risks associated with some of the most difficult drilling projects ever attempted and has evolved into an industry leader. Michels Project Managers are some of the best in the industry utilizing the many resources available while coordinating the various facets of a productive drill site.

Michels' Drill Superintendents are highly experienced at utilizing drill rigs and ancillary equipment of every size. They have worked up though the ranks providing them a complete and comprehensive understanding of safety, environmental monitoring, manpower, equipment operations and repairs for each phase of the drilling operation. As noted on the attached resumes, each Superintendent has drilled throughout North America and has encountered varying soil conditions, from sands, gravels, clay and cobble to solid rock formation. They are well respected throughout the industry and have worked with a majority of the major Pipeline Construction Companies in North America. Michels' personnel maintain continuous certification through accredited schooling for all phases of the drilling operation.

Contingency planning is conducted in response to unforeseen events and conditions, which could occur during normal operating sequences. The following contingency plans are in place to ensure completion of the project in accordance with governing authorities. The Field Operations Superintendent oversees preventative measures before product line installation. This alleviates the probability for adverse conditions such as stuck pipe. The following are some of the more common variables, which we have developed contingency plans for. They include but are not limited to:

Proprietary to Michels

© Copyright, Michels Directional Crossings, a Division of Michels Corporation

Possible Condition: *Inadvertent Drill Fluid Release Response and Control*

Contingency:

A large reduction or sudden loss in drill fluid returns is a signal to the driller and monitoring personnel that monitoring for inadvertent returns should be intensified for possible surface release. Therefore, the proposed drill R.O.W. will be inspected for inadvertent returns at a minimum of twice per shift and becoming more frequent if there is a large reduction or sudden loss. The frequency and results of R.O.W. inspections will be documented and recorded on the daily reports. Early detection and quick response is the key to controlling and/or limiting surface release. Additional information regarding access to USACE-Owned Land is addressed later in this document.

The absence of an open bore-hole conduit or the presence of a major formation fracture can lead to partial and/or potentially total loss of drilling fluid circulation. While it is impossible to determine the precise nature of this type of fluid loss, it is possible to accurately monitor for it by watching for a significant difference between the rate fluid is being pumped down-hole and the rate it returns to the surface. The drilling fluid pumping rate and the rate of drilling fluid return to the surface is constantly monitored by the mud technician and relayed to the driller while the HDD operation is progressing. The driller will know immediately if an unusually high volume of drilling fluid is being lost down-hole, depending on the ground conditions encountered in the crossing and taking into account the volume used to fill the bore-hole. Should the driller believe that circulation is being completely lost he will implement the following procedures:

1) Temporarily cease drilling operations, including pump shut down;
2) Dispatch experienced observers as required to monitor the area in the vicinity of the crossing, for inadvertent returns of drilling fluid at the surface or in the river;
3) Identify the position of the drill head in relation to the point of entry
4) Re-start the pump and stroke the bore-hole up and down in stroke lengths up to 30 feet up to 6 times but no fewer than 2 in an effort to size the bore-hole annulus and re-open the circulation pathway.

Proprietary to Michels

© Copyright, Michels Directional Crossings, a Division of Michels Corporation

In addition, the thixotropic properties of the drilling fluid may be thickened within the guidelines set forth by the manufacturer to aid in re-establishing circulation as required depending on bore-hole conditions. Observers will regularly monitor for inadvertent fluid returns as long as the pump remains on. Occasionally, based on the driller's discretion, it may be useful to increase the stroke length up to 90 feet or past the point at which he believes circulation was lost.

If circulation is re-established, drilling will proceed as usual and monitoring for inadvertent fluid will take place once again if the rate of drilling returns progressively decreases at the fluid entry pit. If circulation is not re-established, monitoring for inadvertent fluid returns to the ground surface and river will continue and drilling will proceed.

If the amount of inadvertent returns is not great enough to allow practical collection, the affected area will be diluted with fresh water and allowed to dry and dissipate naturally back into the earth. If the amount of returns exceeds that which can be suitably contained with hand placed containment barriers, small collection sumps (less than 3.8 cubic meters) will be used to pump fluid back to the solids control system.

When drilling fluid returns are observed to be continuously surfacing above ground at an accessible location the following procedure will be followed:

1) Immediately cease pumping of drilling fluid;
2) Contain the location such that the drilling fluid cannot migrate across the ground surface;

On-Site Materials and equipment used for containment:

- Straw Bales, if available;
- Silt Fence;
- Check Dams;
- Backhoe for Accessible Areas;
- Shovels;

Proprietary to Michels

© Copyright, Michels Directional Crossings, a Division of Michels Corporation

- Portable Pumps;
- 100 feet of Hose.

3) Excavate a small sump pit at the location and provide a means for the fluid to be returned to either the drilling operations or a disposal site (i.e. pump through hose or into tanker);
4) Notify on-site contractor supervisor and Owner's representative as required by the communication plan;
5) Continue drilling operations, maintain the integrity of the containment measures, and monitor the fluid returns as required to ensure that no surface migration occurs;
6) Clean-up is carried out once inadvertent returns are contained/controlled;
7) Fluid pumped to a secure containment vessel;
8) Area is diluted with water;
9) Area is restored to original condition.

If inadvertent drilling fluid returns are observed to be surfacing above-ground at a location that is inaccessible, i.e. along the bed of a water body, or, into the water, the following procedures will be followed:

Ensure that all reasonable measures within the limitations of the technology have been taken to re-establish circulation;

Continue drilling with the minimum amount of drilling fluid required to penetrate the formation and successfully install the product line.

Typically lost circulation has the highest probability of occurring while the pilot hole is being drilled due to the smaller bore-hole annulus and the relatively large volume of solids being displaced and carried out in the drilling fluid. In the course of drilling the pilot hole, circulation will often be temporarily lost as the pilot bit is advanced through more permeable or less

Proprietary to Michels

© Copyright, Michels Directional Crossings, a Division of Michels Corporation

competent sections of the ground formation when fluid pressures are at a maximum. As the pilot bit advances beyond these sections of the bore-hole fluid pressure will fall and circulation within the bore-hole will naturally be re-established. Much of the fluid lost to the formation under the greater pressures will return back to the bore-hole as the pressures fall, in which case the drilling fluid is not likely to migrate to the surface or the river. It is also possible for the drilling fluid to leave the bore-hole and migrate in a direction other than the ground surface or the wetland, in which case it may never be observed even if circulation is lost for long periods of time.

It should be noted that frequently drill cuttings generated as a result of the drilling process will naturally bridge and subsequently seal fractures or voids as drilling progresses, thus providing another means of re-establishing circulation. This is especially likely during the reaming process as higher volumes of larger cuttings are typically generated. Therefore it is usually beneficial to proceed with the pilot hole even if circulation has not been re-established since it will likely be re-established at some point during the reaming process.

The use of an environmentally safe drilling fluid ensures that even in the unlikely event of fluid loss at sensitive areas, there will be no adverse environmental impact other than a temporary minor increase in turbidity until the drilling fluid dissipates. It is important to note that any temporary increase in turbidity as a result of inadvertent drilling fluid loss while directional drilling the crossing will be several orders of magnitude less than that of an open-cut crossing.

Contingency Access Plan for USACE-Owned Lands in Event of Unanticipated Return

In event of an unanticipated return of drilling fluid on U.S. Army Corps of Engineer (USACE) owned lands, WBI Energy, Inc. (WBI) and its contractors would mobilize clean-up crews as soon as practicable. Crews would utilize access points and routes identified on Figures 1 and 2 (North Side and South Side of the Lake Sakakawea horizontal directional drill). To the extent practicable WBI Energy will use publically available access roads to reach inadvertent return cleanup areas. WBI and its contractors will notify landowners prior to the commencement of HDD drilling activities and will work expediently to contact landowners in event of an inadvertent return.

If necessary, equipment used to access and clean-up inadvertent returns of drilling fluid on the ground surface of USACE owned property would include rubber tired vehicles, such as pick-ups

Proprietary to Michels

© Copyright, Michels Directional Crossings, a Division of Michels Corporation

and vacuum trucks (vac-trucks). It is anticipated that for an inadvertent return of drilling fluid to the ground surface, access to USACE owned property would follow the paths illustrated on Figures 1 and 2, the primary route on both sides of the Lake Sakakawea HDD would be along the permanent right-of-way leading from the drill box to the banks above the shoreline. From the permanent right-of-way, a direct perpendicular route would be taken to reach the site of the inadvertent return with the shortest path. To the maximum extent practicable, woody vegetation (trees and shrubs) will not be cleared; access paths would avoid trees and general vegetation disturbance to the maximum extent practicable. Where necessary crews will travel around persistent, live, woody vegetation.

If access is necessary along the beach on either the north side of Lake Sakakawea, as shown in Figure 1, or the south side of Lake Sakakawea, as shown in Figure 2, crews will either access the clean-up location by walking in, or utilizing small, low ground pressure equipment, such as UTVs or ATVs. A secondary option for beach access would be to mobilize a small boat from a public dock to bring personnel and cleanup equipment to the beach. Every effort will be made to access clean-up sites, if necessary, from the higher ground along the permanent right-of-way. After clean-up of drilling fluid is complete, crews will follow the same path out that was taken in to the inadvertent return, to minimize additional disturbance. Calls will be made to the appropriate USACE point of contact as soon as feasible, but not greater than 24 hours from the time crews are mobilized to clean-up the inadvertent return.

Attachment – Figure 1

Attachment – Figure 2

Possible Condition: *EQUIPMENT MALFUNCTION/FAILURE-SPARE PARTS*

Contingency: Based on past experience, Michels can reasonably estimate the average life expectancy of all major components of the drilling operation under normal operating conditions. The operating hours of the equipment are recorded prior to start of drilling operations and maintained throughout completion of the crossing. Documentation and maintenance records are maintained by the drilling superintendent so that replacement of key components can be routinely performed in a timely manner to prevent failure. Occasionally, a component of the drilling operation will fail unexpectedly even with the most stringent maintenance and replacement schedule. These types of failures have occurred in the past and

© Copyright, Michels Directional Crossings, a Division of Michels Corporation

Michels has established a spare parts inventory with each drill rig based on the most common failures of this type. Spare parts kept on site include hydraulic pumps, flendor motors, and drive gears. In addition, odd sized or extremely high pressure hydraulic hoses that are not readily available "off the shelf" are kept on site.

Major Spare Parts kept on-site

- 1,800-Mission pump
- 2,500-Halco pump
- Mud Rig – Clutch and Transmission
- 11 – Vise Blocks
- 4 - Vise Hydraulic Rams
- 2 - Rotary Motors
- 2 – Drive Motors
- 1 – Hydraulic Pump
- 2 – Vise Travel Motors
- 1 – Circulation Pump
- 2 – Mud Swivels
- 2 – Complete Rebuilds for OPI-350
- Rebuild Parts for EW-446
- Electric Motor for Halco
- Electric Motor for Cooling Fans
- 2 – Shaker Motors

It is not feasible to maintain a complete spare parts inventory with each drilling rig on site so Michels immediately identifies local sources for commonly available spare parts and equipment upon job start up. Spare parts not readily available locally are kept in one of four Michels' permanent warehouse locations in Bothell, Washington; Adrie, Alberta Canada; Harrisburg, Pennsylvania; or Brownsville, Wisconsin, where the parts can be shipped overnight to the job site to prevent extensive down time caused as a result of equipment failure if necessary.

Possible Condition: *STUCK PIPE*

Contingency: The following are some of the preventative measures invoked by the Drilling Foreman in order to reduce the chances for complications while pulling back product pipe.

1. Utilize drilling equipment capable of supplying enough power to remove seized pipe from either entry or exit location.

Proprietary to Michels

© Copyright, Michels Directional Crossings, a Division of Michels Corporation

2. Performing an extra reaming pass with the purpose of cleaning out the reamed hole (not a cutting pass) and adding proper lubrication with precise weight bentonite mixture.
3. Reduce torsional and axial loads through the use of properly spaced rollers, well maintained swivels and creating a smooth transition between downhole exit angle and pipe strung out on top of ground readied for pullback.
4. Utilize Ballasting to control the weight of the pipe by achieving negative or neutral buoyancy.

Contingencies for stuck pipe

If above preventative methods fail and the pipe become seized in the borehole we invoke Best Available Control Technology (BACT). One of the methods involves specific techniques in conjunction with ballasting, which is controlled loading with water. Past experience has shown us that if the leading end of the pipe remains too heavy during ballasting, air can be supplied to this area of pipe, displacing water back toward the middle, and in some circumstances freeing up the point of greatest friction.

If the drilling rig is unable to supply the initial thrust to release the seized pipe, side booms and or track-hoes can supply thrusting pressure from the exit side in order to start momentum. Michels drilling rigs have the potential to supply up to 1,200,000 pounds of thrust and pulling-force, add additional equipment and there is not much that cannot be dislodged.

Not only can force be applied from the drill-rig side but additional force can be applied from the pipe installation side for large diameter installations through the use of a Herrenknect pipe thruster for land to land crossings. This alternative source of power supplied from the opposite end can dramatically assist large diameter pipe pullback during significant changes in the effective weight of the pipe during pullback (buoyancy) caused by either losing circulation or re-establishing circulation unexpectedly therefore causing drastic changes in the buoyancy of the pipe. This method also reduces the risk for damage to pipe coating during pullback by reducing the tensile force needed to pull back the pipe. If the large diameter pipe becomes stuck additional control can be established to move pipe back and forth in the event gravel, cobble and/or boulder sized

Proprietary to Michels

© Copyright, Michels Directional Crossings, a Division of Michels Corporation

materials fall in the hole after swabbing. This can be used as an alternative to the percussion hammer which has been used as a contingency measure on previous past projects.

(See Attachment Herrenknect Pipe Thruster)

If percussion assistance is determined to be necessary to supply the energy required to complete the pullback operation, Michels is capable of performing this operation utilizing a GrundoRam percussion hammer supplied by TT-Technologies. The work area needed for invoking hammer assist procedures is located on the pipe pullback side of the crossing. This will encompass an area of 40-feet long x 20-feet wide for staging of the "Taurus" GrundoRam percussion hammer and assist equipment. This pipe-ramming machine has a thrust of up to 2,000 tones and a ramming speed of 180-strokes/minute. A GrundoRam and 1600 CFM air compressor will be made available by Michels on-site. Additional sources for spare parts and accessories should also be identified.

(See Attachment Grundo-Ram Percussion)

A specially manufactured reinforced push ring is positioned at the back end of the product line so that equal transmission of percussion energy can be transmitted down the product pipe, and to protect the steel pipe end while in contact with the GrundoRam "Taurus". The persistent exertion of energy along the descending steel pipeline aids in aggressively sliding the pipe through suspect areas of unconsolidated formation or through areas of cave-in. Although this is not a regular occurrence due to mitigative measures taken prior to installation, Michels has successfully completed this unique form of pipeline pullback assist periodically over the past 10-years and has built a solid reputation as an innovator in this field.

Possible Condition: *INCLEMENT WEATHER*

Contingency: Key personnel monitor long range forecasts for the project areas to be affected. Various weather services (i.e. NOAA, Weather Channel etc) are monitored by computer for bad weather and potential hurricanes. Regular updates are given to Michels' personnel to make them aware of approaching weather conditions. Evacuation routes will be identified and reviewed with all personnel for potential hurricanes prior to beginning work and responsibilities will

Proprietary to Michels

© Copyright, Michels Directional Crossings, a Division of Michels Corporation

be assigned. If electrical storms are projected to affect a drill site, approaching storms will be monitored by radar and radio and communication will be maintained between Project Manager and personnel. Electrical storms can potentially cause serious problems for a drilling operation. The Drill Superintendent must use his discretion as to the appropriate safe action to be taken for the safety of the crew and entire drilling operation. Proper grounding must be maintained throughout a drilling operation.

A safe area on the site will also be designated for response to an approaching tornado. Stream gages will also be identified and monitor for potential flooding conditions.

Possible Condition: *NOISE*

Contingency: Noise reduction can be accomplished using several methods. To begin with, a site reconnaissance or noise modeling must be completed by the Owner to determine what decibel (dB) level will be allowable at the affected locations. Some of the Noise Control Considerations include: Redirection of sound waves or deadening just by the simple positioning of drilling equipment and strategic location of frac-tanks. This option generally has little affect upon cost and may cause minor inconveniences for the drilling operation.

Another option is to utilize hospital/industrial grade mufflers to deaden sound as it leaves engines of motorized equipment. This could impede maximum operating output from equipment and also slow down the drilling operation.

More costly forms of Sound Control include; Building walls made of hay bales, sound curtain matting or plywood, or, building sound deadening enclosures constructed of wood.

Possible Condition: *DAMAGE TO EXISTING UTILITIES*

Contingency: Preventative measures include proper notification of local utilities through area one-call programs or site investigation and recording of area markers, manholes and valves. Pot-holing existing utilities is the most reliable method of exact utility location

Proprietary to Michels

© Copyright, Michels Directional Crossings, a Division of Michels Corporation

Damage to existing utilities or structures may occur during drilling or reaming operations. Occasionally unknown or unmarked utilities may be hit during drilling or reaming operations. If this circumstance does occur the type of utility is first identified so that severity of response can be identified. Emergency personnel for the identified utility are then notified. Pertinent personnel for the Owner and/or Owner Representatives are then notified, following the chain of command. Decisions are then made as to appropriate action to be taken.

Possible Condition: *ENCOUNTERING SUBSURFACE OBSTRUCTION*

Contingency: Occasionally an unknown subsurface obstruction is encountered during drilling operations such as; 1) buried tanks, 2) Building foundations/piers/pilings, 3) buried junk/cars. If this situation occurs, the location of the object is first identified in relation to the drill path. If the current R.O.W. is ample and soils provide adequate steering capabilities, the drill head is pulled back to a pre-calculated point along the previously drilled path and the drill bit is rotated and steered around the obstruction.

The chance of encountering an obstruction during reaming operations is highly unlikely. But, if this should occur, the magnitude of the obstruction must first be evaluated. If the obstruction is determined to be impassible, operations will be halted until an agreeable solution can be determined.

Possible Condition: *RUNNING SANDS*

Contingency: It is possible that loose cohesionless soils, such as running sands, may not support the drilled annular space over a long directional drill length. Although this circumstance sounds serious, it may not prevent the installation of a pipeline. Mechanical agitation of the formation by the downhole tool and trailing drill string, combined with the injection of bentonite drilling fluid causes the soils to experience a decrease in shear strength. When the resulting shear strength is low enough, the soil will react in a fluid-like manner thus, allowing the pipeline to be pulled through it.

Proprietary to Michels

© Copyright, Michels Directional Crossings, a Division of Michels Corporation

It would be highly unusual for soil strata to be of the same consistency from drill entry to drill exit, especially at the various depths encountered during pilot hole drilling. Prior to drilling, only general soil information is known for estimating and hypothesizing. The type of drilling fluid providing the best performance capabilities for the conditions is chosen based upon this information. Adjustments are then made in the field correlating to specific soil properties in order to improve performance.

Possible Condition: *PIPELINE MISALIGNMENT*

Contingency: Today's technology in the directional drilling industry provides state of the art instrumentation and tracking capabilities. The directional drill alignment is accurately known to within ± 0.01° or, ± 1.4 feet per 1,000 feet in both profile and plan view. The addition of Para Tracker as a secondary form of verification and validation for plan view orientation, left and right of center line, provides precise information which is updated regularly during drilling operations. The most frequent cause of misalignment is the inability to steer in transitional zones near the exit location. These soils may include varying degrees of overburden or formations allowing unpredictable degrees of penetration. The orientation or angle of these zones from horizontal may deflect the drill bit having a direct affect upon steering capabilities.

In any case, the steering probe maintains its tracking capabilities and allows the Survey Technician continuous feedback for locating the drill string in a three dimensional plane. Any deviation from the targeted exit is known and can be compensated for. If the target area is not large enough to accommodate the deviation, the drill string can be pulled back to a calculated point and be redirected toward the proposed exit location.

Possible Condition: *PRESSURE CONTROL*

Contingency: An important function of the drilling fluid is to prevent the uncontrolled entry into the hole of fluids from the formation penetrated by the bit. The pressure exerted by the column of drilling fluid (hydrostatic head) must be somewhat greater than the pressure exerted by the formation fluids to allow raising the drill string without any problems. Following are some mitigative measures taken to counteract pressures.

Proprietary to Michels

© Copyright, Michels Directional Crossings, a Division of Michels Corporation

1. Avoid swabbing drill string (plunging the drill string back and forth with great force)
2. Keep the hole full of drill mud while pulling the drill pipe, especially when hydrostatic head is not much greater than formation pressure.

At any given depth, the hydrostatic pressure (in psi) of the mud column is equal to mud density (in lb/gal) times depth (in feet) times 0.052

Psi (hydrostatic pressure)	=	lb/gal (density)	x	feet (depth)	x	0.052

Possible Condition: *HOLE COLLAPSE*

Contingency: Most drillable formations, whether consolidated or unconsolidated, have some form of cohesive properties allowing drilling fluid to interact and add to its bonding properties, thus avoiding hole collapse. Some soils, such as large gravel zones or cobble areas may not be capable of holding a hole. If this type of formation exists in the overburden soil (upper strata), a steel casing pipe may be washed over the drill stem into competent soil and left in place during operations. Drilling and reaming operations will then resume utilizing this conduit as a means of carrying drill cuttings back up-hole without obstruction. This reduces the chance for lost circulation. Under this circumstance, the integrity of the pipe coating **cannot** be guaranteed.

If this type of formation exists throughout the borehole, it should be known and researched prior to drilling so that an alternate route may be researched. The route that provides the best chance for success should be the route chosen. If a competent drilling contractor properly investigates a route, the chance for a hole collapse is greatly reduced.

Proprietary to Michels

Possible Condition: *PIPELINE COLLAPSE*

Contingency: Pipeline collapse during pulling operations is a rare occurrence caused by certain factors, which must be considered before pullback begins. Some of the main factors, which must be considered during pre-planning stages or prior to pipeline pullback operations, include:

© Copyright, Michels Directional Crossings, a Division of Michels Corporation

1. Pre-engineered profile must reflect the minimum radius of curvature calculated for the given pipe (wall thickness, pipe size, tensile strength, X-rating)
2. Drilled profile should not exceed pipe tolerance throughout the drilled borehole.
3. Experienced directional drilling Survey Technician verifies three joint radii calculations for maximum degree of bend per 30-foot joint.
4. Industry standard safety factor should be included in the profile and calculations taking into account unknowns.
5. Exit and entry angles must be within specified tolerances so that support equipment capabilities are not exceeded in order to provide the pipeline a smooth, uninhibited transition into the opened hole.
6. Calculations performed for anticipated stresses the pipe will be subjected to during pullback (i.e. Pull loads, tensile, unconstrained buckle, hoop stress.) This way upper stress limits will be known.
7. Proper ballasting of product line through controlled loading of water to the leading end of pipeline. This procedure also provides internal pressure to the product line as a counter balance to external pressures. If water is added to the opened end of the product line and allowed to flow down toward the leading end during pullback, a vacuum may occur creating undue stress on the product line which would increase the possibility of implosion or collapse. Therefore, a conduit is positioned to carry water through the interior of the product pipe dispersing water at the leading end of the pipe filling it from the lowest portion (elevation) toward the highest elevation. Volume calculations are maintained to ensure only the lowest portion of the pipe is maintained full of water.

The appointment of highly competent personnel experienced in pipeline pullback procedures is a must. There is no substitute for experience. Experienced personnel should be placed at critical positions at both the drill entry and exit locations.

GRUNDO RAM
PNEUMATIC PIPE RAMMER

Proprietary to Michels

© Copyright, Michels Directional Crossings, a Division of Michels Corporation

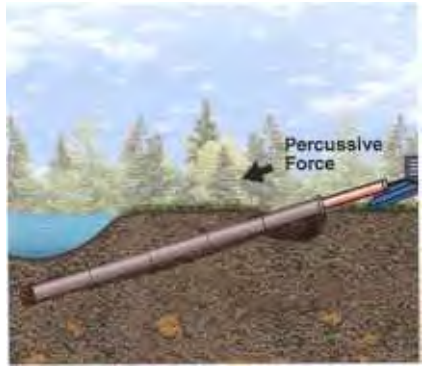
Percussive Power

for directional drilling assist

Conductor Barrel™

A sure start for your bore even in the worst soil.

- Ram casings through difficult soil conditions to more desirable drill starting points.
- Guide down-hole or mud motors to rocky soils through the conductor barrel.
- Provides friction-free section for product pullback.



Pullback Assist

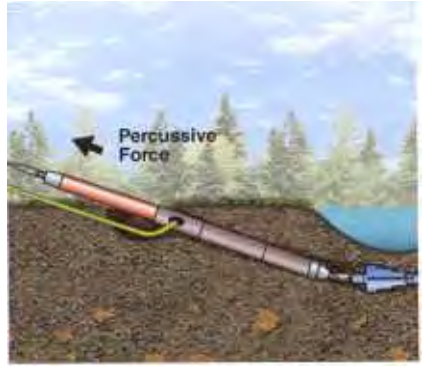
Overcome hydrolock with a pipe rammer.

- Rammer attached to product pipe during pullback.
- Percussive action keeps pipe moving and helps prevent high levels of pullback stress.
- Percussive power frees immobilized product pipes.

Pipe Removal

Remove stuck product pipe and bore again.

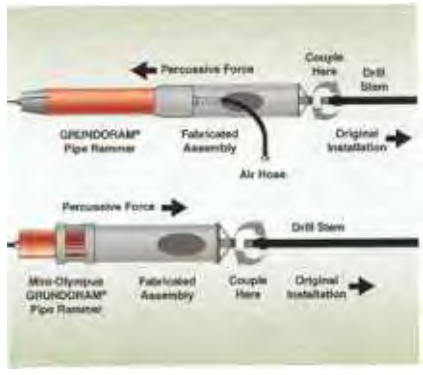
- Rammer attached to product pipe after pullback fails.
- Percussive action pulls product pipe, removing it from the bore.
- Salvage the job and bore again.



Drill Stem Recovery

Retrieve stuck drill stems.

- Pipe Rammer fitted with a special sleeve.
- Stuck drill stem welded to the back of the rammer sleeve.
- Percussive power frees drill stem, saving time and money.



"Power without limits!"

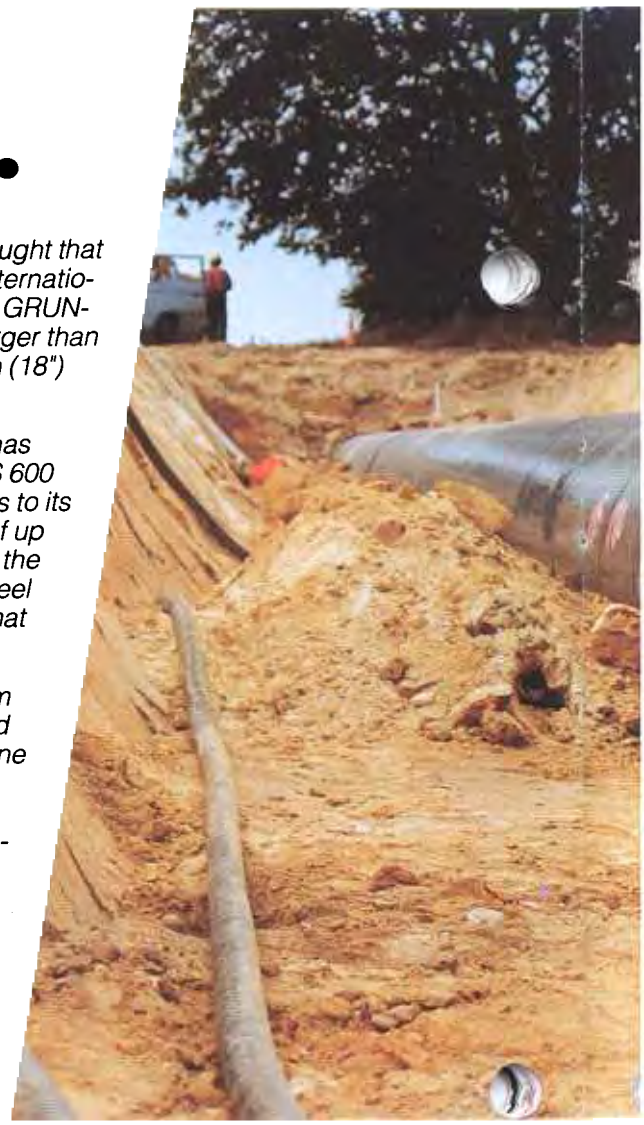
The strongest in existance ...

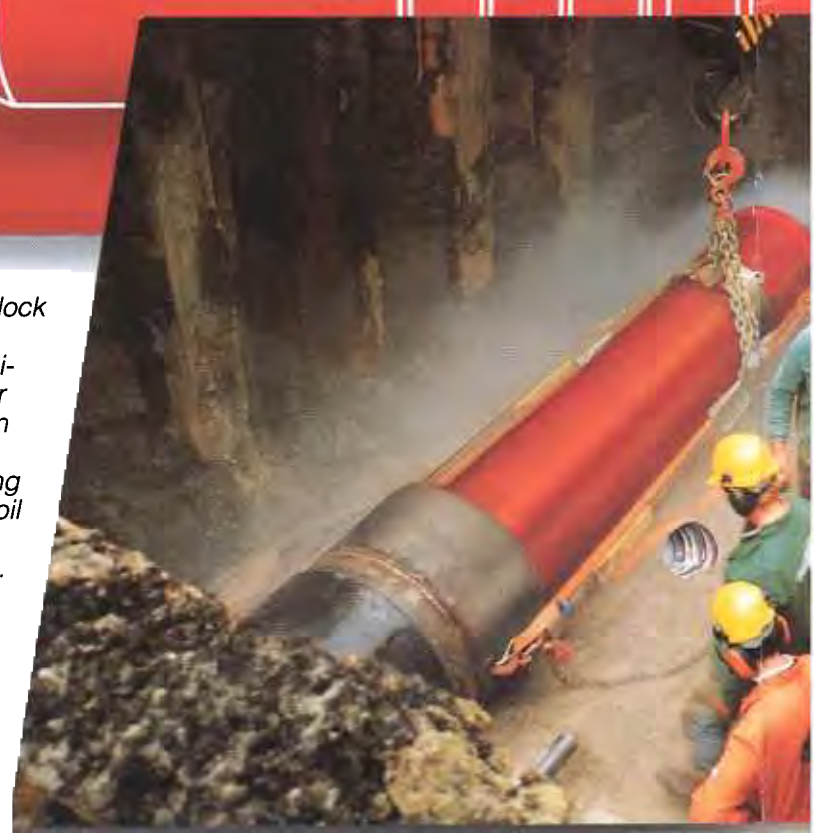
Who would have thought that there would be an international requirement for a GRUNDORAM hammer - larger than the GOLIATH 450 mm (18") machine?

International demand has made the new TAURUS 600 mm (24") a must. Thanks to its dimensions and thrust of up to 2,000 tons (4,480 lbs) the TAURUS is the largest steel pipe ramming machine that exists.

Steel pipes up to 2,000 mm (80") can now be installed with this powerful machine when installing casing or product pipes for the water, sewage, telephone, electricity and gas industries or railway authorities.

When other ramming equipment has reached its power limit the TAURUS offers that extra power to get that pipe into the ground.





It is designed of a monoblock main casing made from a high quality alloy with a unique flexible control stud for perfect impact transmission onto the steel pipe. This makes it a reliable and lasting boring unit even in difficult soil conditions or over long stretches of steel pipe installation.

A GRUNDORAM's number of strokes has a direct influence on the forward ramming speed. However, high ground

TAURUS

Ø of rammer.....	.....24"

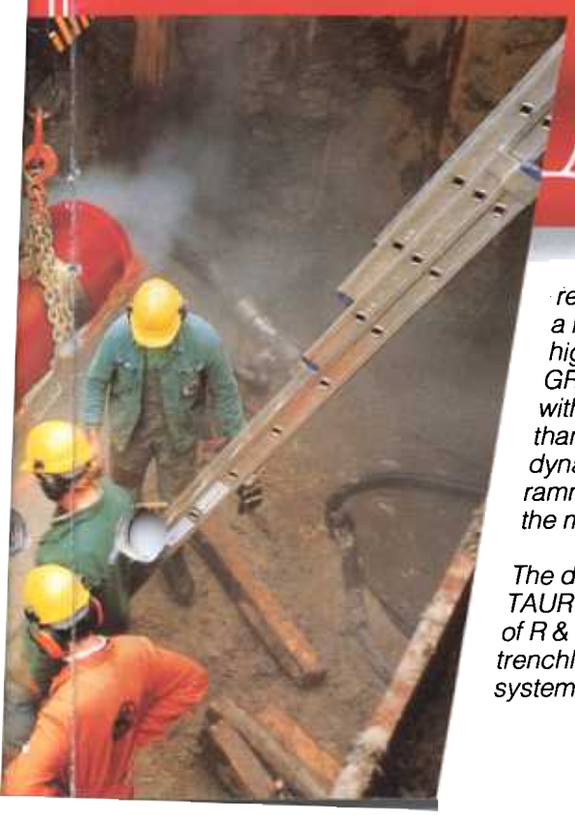
A TAURUS used on a gas pipeline installation.



resistance and friction require a low stroke frequency with a higher single impact. The GRUNDORAM model TAURUS with 180 strokes/min and more than 2,000 tons (4,480 lbs) of dynamic thrust ensures high ramming speeds even under the most difficult conditions.

The development of the new TAURUS is the result of years of R & D in the field of trenchless pipe laying systems.

The GRUNDORAM is suitable to resist the highest stress in difficult soils thanks to its monoblock casing and flexible control stud.

GRUNDORAM

Good examples back up our claims

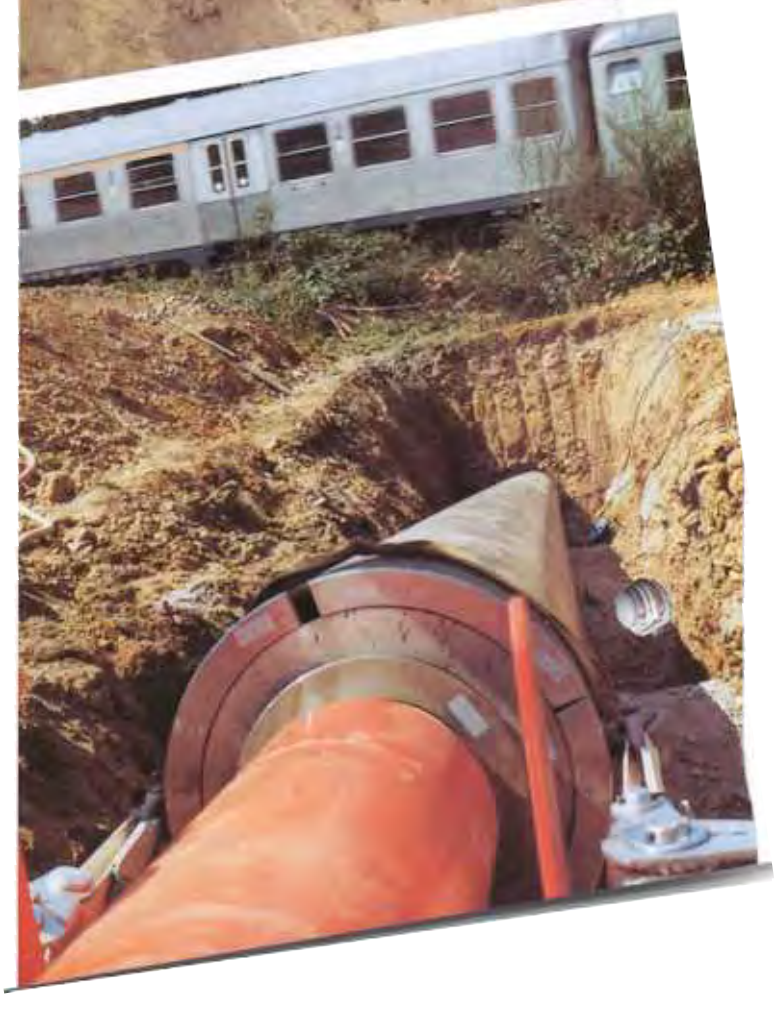
Global usage is quickly leading to the general acceptance of the robust GRUNDORAM system. Contractors value the ● simple operation and ● reliability the ● enormous impact power, the ● wide range of applications, the ● quick and easy preparation and the ● sturdy accessories.

● 220 ft of steel pipe, 14" diameter was rammed under a canal to accommodate 8 fibre-optic cables.

● 125 ft of 59" diameter pipe was laid under an embankment in Manchester, England, as a drainage system.

● 65 steel pipes of 28" diameter were installed parallel to each other under the main Seoul-Pusan railway line in South Korea.

● A 24" steel pipe was easily rammed along a 131 ft stretch under a railway embankment south of Cairo/Egypt.



"Typical" but also not everyday jobsite projects are excellent references, for example

● 115 ft of steel drainage pipe of 55" diameter was perfectly installed under the river Pader in the heart of the city of Paderborn/ Germany

● 200 ft of 30" steel casing for gas/telecom/mains supply was installed under the A 1 motorway without traffic disruption or diversions

● *90 steel pipes of 20" diameter were driven in vertically to provide solid foundations for a noise-protection barrier in Germany.*

There are many other typically good examples that could be listed. If you are interested in specific cases, contact us - we will supply you with detailed information.

Additional Power for Pipe Pullback.

The newly developed Herrenknecht Pipe Thruster is an auxiliary device for Horizontal Directional Drilling Technology and extends its field of application. The Thruster is mounted at the exit point and helps to push the entire pipeline into the ground. It is particularly suited for extremely long pipelines, very large diameters or difficult geological conditions. Depending on the project the Pipe Thruster can be used as a support tool, a rescue tool or as a pipe installation tool.

After finishing the pilot hole and the reaming procedures using a HDD Rig the Pipe Thruster assists during the pipe pull. The Pipe Thruster is mounted at the exit point and pushs the product pipe into the enlarged hole while the Rig is pulling the pipe. This simultaneuos process will reduce the stresses on the drillpipe and the product pipe.

Beside improved safety the Pipe Thruster allows drill lengths of more than 3,000m and makes the use of big pipe diameters more common.

HERRENKNECHT
Tunnelling Systems

Innovative Solution: The Pipe Thruster

Range of Application

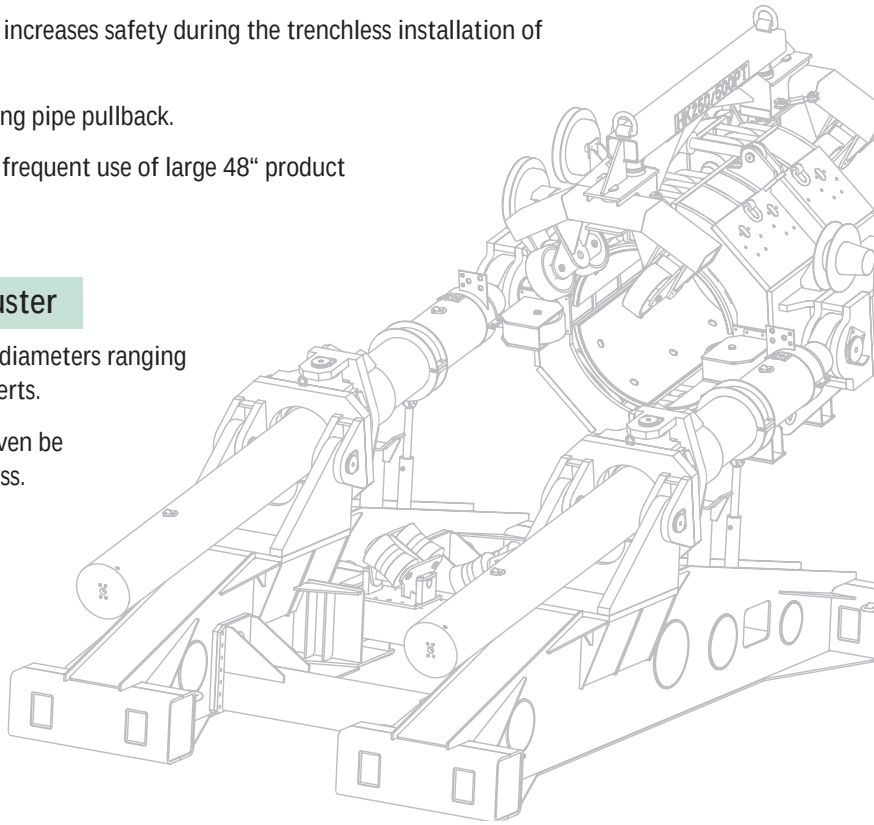
- Support of the HDD process during pipe pullback.
- Sea Outfall projects: ashore thrusting of the product pipeline.
- Rescue Tool for the recovery of stucked pipelines, e.g. in difficult geological conditions.

Advantages of the Method

- The deployment of the Pipe Thruster allows to add a push force from the exit point to the pull force of the HDD Rig.
- The flexible load distribution at the entry and exit point increases safety during the trenchless installation of pipelines considerably.
- Reduced stress for drill pipes and rigsite equipment during pipe pullback.
- Increase of drill lengths to more than 3,000m and more frequent use of large 48“ product pipe diameters.

Advantages of the Herrenknecht Pipe Thruster

- The Herrenknecht Pipe Thruster can be used for all pipe diameters ranging between 20“ and 48“ by just changing the clamping inserts.
- Due to a tilting clamping device the Pipe Thruster can even be installed when the pipeline pullback is already in progress.
- The clamping device is suitable for all types of pipelines and coatings.
- The modular design does not require special cargo transports.



Technical Data

Pipe Thruster

- Operating angle: 5° - 15°
- Push and pull force (normal): 250t (2,500kN)
- Push and pull force (maximum): 500t (5,000kN)
- Min. clamp diameter: 20“ (508mm)
- Max. clamp diameter: 48“ (1,219mm)
- Max. speed: 5m/min.
- Stroke of push/pull cylinder: 5,000mm
- Dimensions: 9 x 4.1 x 4.4m
- Weight: 45t

Power Unit

- Dimensions: 20ft container
- Installed power: 400kW
- Weight: 10t
- Remote control and hydraulic hoses to the Pipe Thruster are included.

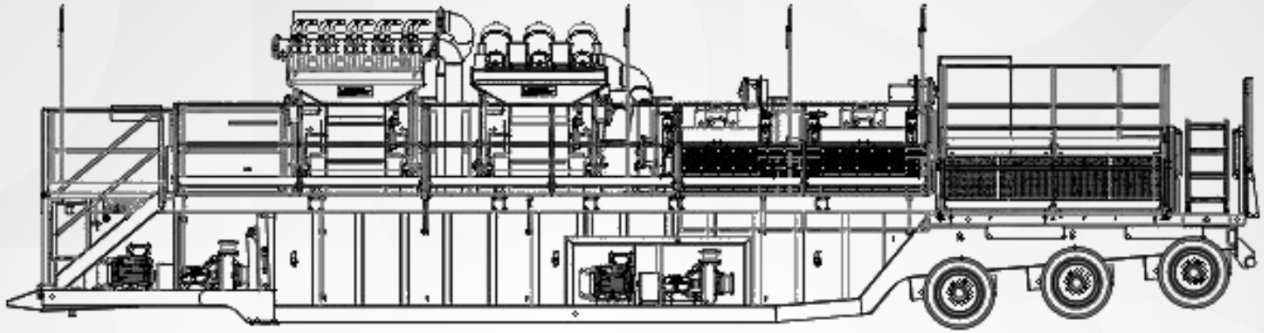
MICHELS®

ATTACHMENT

DRILL FLUID RECYCLING FLOW CHART

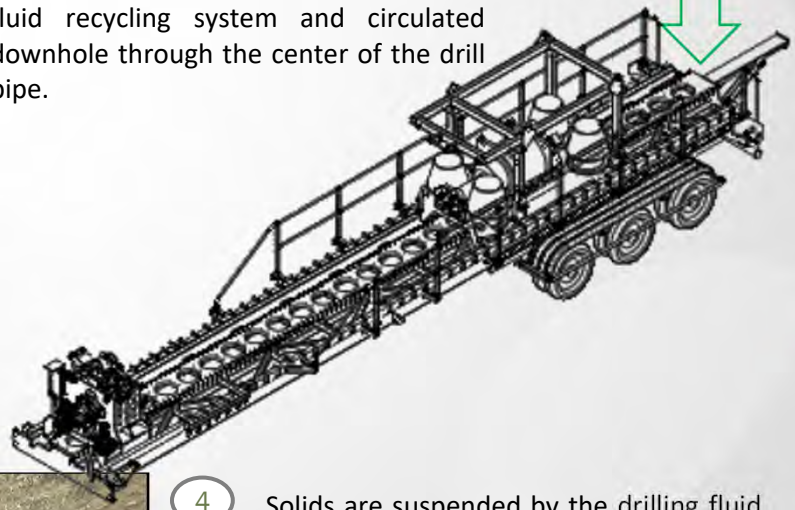
© Copyright, Michels Directional Crossings, a Division of Michels Corporation, 2018

1 Drilling fluid volume is initially prepared consisting primarily of bentonite (NSF/ANSI-60 Drinking Water Additive Standard Certified) & water. Pumps are used to circulate the fluid downhole.



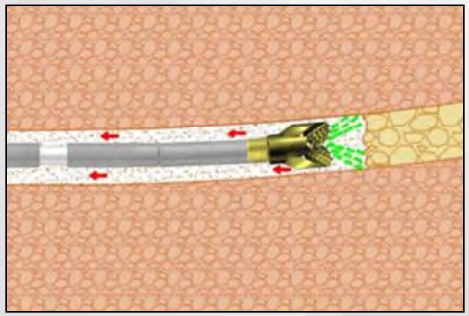
CLEAN FLUID

2 Drilling fluid is pumped from the drilling fluid recycling system and circulated downhole through the center of the drill pipe.



3 Once downhole, drilling fluid serves the following purposes;

- In alluvial formations, assists with jetting the hole
- Transports cuttings to the surface
- Aids in stabilizing formations
- Provides lubrication & tool cooling
- Provides hydrostatic fluid pressure to balance formation pressure.



SOLIDS LADEN FLUID

4 Solids are suspended by the drilling fluid downhole and transported throughout the annular space to the entry pit at surface.

5 Solid laden drilling fluid returns to the recycling system where it is processed by large particle shakers, de-sanders & de-silters. It is during this stage that the suspended cuttings are removed and the desired drilling fluid rheology is restored.

MICHELS®

WBI ENERGY TRANSMISSION, INC.
North Bakken Expansion Project
Section 408 Application

Attachment 2
Surface Use Plan of Operation

August 2020

WBI ENERGY TRANSMISSION, INC.
NORTH BAKKEN EXPANSION PROJECT
SURFACE USE PLAN OF OPERATION

1.0 PROJECT DESCRIPTION

WBI Energy Transmission, Inc. (WBI Energy) proposes to construct and operate the North Bakken Expansion Project (or Project), which consists of an approximately 62-mile-long, new 24-inch-diameter natural gas pipeline from new facilities at WBI Energy's Tioga Compressor Station near Tioga, North Dakota, to a new compressor station (Elkhorn Creek Compressor Station) southeast of Watford City, North Dakota.

The Project also involves construction of approximately 0.3 mile of new 24-inch-diameter natural gas pipeline between the proposed Elkhorn Creek Compressor Station to a new interconnect with Northern Border Pipeline Company, approximately 20.4 miles of new 12-inch-diameter natural gas pipeline looping along WBI Energy's Line Section 25, approximately 9.4 miles of new 12-inch-diameter natural gas pipeline looping along WBI Energy's Line Section 30, approximately 0.5 mile of new 20-inch-diameter receipt lateral to the Tioga Compressor Station, and uprating of WBI Energy's Line Section 25. The Project includes additional horsepower at the Tioga Compressor Station; the installation of new and modifications to existing delivery, receipt and transfer stations along WBI Energy's pipeline routes; the replacement of small segments of pipeline facilities; and the installation of block valves, pig launcher/receiver stations and other associated appurtenances.

The Project will require crossing of the Lake Sakakawea Reservoir, which is managed by the U.S. Army Corps of Engineers (USACE), along with USACE-owned lands adjacent to Lake Sakakawea. WBI Energy proposes to install the natural gas pipeline under Lake Sakakawea and USACE lands using the horizontal directional drill (HDD) construction method, a trenchless method designed to avoid direct impacts to sensitive features. The HDD workspaces will be located adjacent to USACE-owned lands on the north side of the lake, and approximately 800 feet from USACE-owned lands on the south side of Lake Sakakawea. No surface impact to USACE lands is anticipated for this Project during installation and operation of the pipeline; all temporary surface impacts will be located outside of USACE lands. Access in the area of the proposed HDD will be along public and private roads.

2.0 CONSTRUCTION TECHNIQUE

The proposed HDD will be approximately 2.9 miles (15,393 feet) in length and will cross 12,934 feet of USACE-owned lands. For the HDD crossing of Lake Sakakawea, WBI Energy anticipates using the intersect method, where a single alignment is achieved by drilling from both ends so as to connect the drills underground. Electromagnetic sensors located on the tip of the drill bit will allow the operator to follow the sensor grid along the prescribed path. Once the pilot hole is completed, the sensor grid will be removed and the hole will be enlarged through a process called reaming. A reaming tool will be installed at one end of the drill string on the exit side of the pilot hole, and then pushed or drawn back to the drill rig to enlarge the hole. Several passes with progressively larger reaming tools may be required to enlarge the hole to a sufficient diameter to accommodate the pipeline. During this process, drilling fluid, or mud, consisting of in-situ material and water (and possibly bentonite clay) will be circulated through the hole to remove drill cuttings and maintain the integrity of the hole. Once the reaming process is complete, a prefabricated segment of pipe will be attached to the drill string on the exit side of the crossing, and pulled back

through the hole toward the drill rig. The pipe segment will generally be hydrostatically tested prior to its installation, and once installed, connected on either side of the crossing to adjoining sections of pipe. The pipe segment will be hydrostatically tested a second time with the remainder of the pipeline system.

3.0 LAND REQUIREMENTS

WBI Energy has requested that the USACE issue a real estate easement across Lake Sakakawea and on adjacent USACE-owned lands. The requested easement would be 50-feet (25-feet either side of centerline) in width and 12,934 feet in length centered on the proposed pipeline. A legal description of the requested easement is provided in Appendix A – Easement Plats.

WBI Energy will maintain the easement according to easement provisions. No surface occupancy of USACE land is proposed as part of the Project. Additionally, WBI Energy does not propose to maintain vegetation (i.e., clear, mow, or apply herbicide) within the easement on USACE lands during operation of the pipeline. However, WBI Energy will conduct periodic inspections of the pipeline right-of-way as outlined in WBI Energy Transmission – Gas System Operation and Maintenance Manual (CUI/PRIV – DO NOT RELEASE included as Appendix A of Attachment 6 of the 408 Permit Application package). The proposed Project will be incorporated into WBI Energy's extensive Supervisory, Control, and Data Acquisition System (SCADA). The Gas Control Center is located at WBI Energy's headquarters in Bismarck, North Dakota, and is staffed 24 hours a day, 365 days a year. Gas controllers use SCADA to monitor the pipeline system, which includes a wide range of activities such as monitoring gas pressures and flows along the pipeline, physical startup and shutdown of compressor sites, and operating system valves along the pipeline.

Data acquisition occurs at many locations along the mainline, such as compressor stations, and meter stations. This data is transmitted to Gas Control through SCADA. If system parameters fall outside a predetermined range, an alarm is activated at Gas Control and corrective action is taken by the gas controller as needed. Local WBI Energy personnel are dispatched in response to these alarms if intervention is required outside Gas Control. WBI Energy will also conduct a baseline assessment using in-line inspection of the proposed pipeline in accordance with U.S. Department of Transportation requirements to check for damage, deformities, or other factors that could affect the integrity of the pipelines. If potential problems are identified and maintenance or repair of the pipeline is required, WBI Energy would request separate authorization from the USACE and other applicable agencies to repair or maintain the pipeline.

S1/2SE1/4SW1/4 SEC. 18, T154N, R96W, 5TH P.M.,
WILLIAMS COUNTY, NORTH DAKOTA
EXHIBIT A

PIPELINE RIGHT-OF-WAY DESCRIPTION ON U.S. ARMY CORP. OF ENGINEERS LANDS IN SECTION 18

A 50' WIDE RIGHT-OF WAY 25' ON EACH SIDE OF THE FOLLOWING DESCRIBED CENTERLINE.

BEGINNING AT A POINT OF THE NORTH LINE OF THE SOUTH HALF OF THE SOUTHEAST QUARTER OF THE SOUTHWEST QUARTER (S1/2SE1/4SW1/4) OF SECTION 18, T154N, R96W, 5TH P.M. WHICH BEARS N87°57'29"W, A DISTANCE OF 247.72' FROM THE NORTHEAST CORNER OF SAID SOUTH HALF OF THE SOUTHEAST QUARTER OF THE SOUTHWEST QUARTER; THENCE S16°30'40"W, A DISTANCE OF 682.55' TO A POINT ON THE SOUTH SECTION LINE OF SAID SECTION 18, WHICH BEARS N87°55'18"W, A DISTANCE OF 3058.32' FROM THE SOUTHEAST SECTION CORNER OF SAID SECTION 18. THE SIDE LINES OF SAID DESCRIBE RIGHT-OF-WAY BEING SHORTENED OR ELONGATED TO MEET THE GRANTOR'S PROPERTY LINES. CONTAIN 0.784 ACRES MORE OR LESS.

Notes:

1. This survey was prepared without the benefit of title research. Ownership information provided by client.

2. Date of Survey: February 2019

Survey Datum:

NORTH DAKOTA NORTH (NAD 83) - International Foot

Attachment 3

Erosion Sedimentation Control Plan

WBI ENERGY TRANSMISSION, INC.
North Bakken Expansion Project
Section 408 Application

Attachment 3
Erosion and Sedimentation Control Plan

August 2020

WBI ENERGY TRANSMISSION, INC.
NORTH BAKKEN EXPANSION PROJECT
EROSION AND SEDIMENTATION CONTROL PLAN

WBI Energy Transmission, Inc. (WBI Energy) proposes to construct and operate the North Bakken Expansion Project (or Project), which consists of an approximately 61.9-mile-long, new 24-inch-diameter natural gas pipeline from new facilities at WBI Energy's Tioga Compressor Station near Tioga, North Dakota, to a new compressor station (Elkhorn Creek Compressor Station) southeast of Watford City, North Dakota.

The Project also involves construction of approximately 0.3 mile of new 24-inch-diameter natural gas pipeline between the proposed Elkhorn Creek Compressor Station to a new interconnect with Northern Border Pipeline Company, approximately 20.4 miles of new 12-inch-diameter natural gas pipeline looping along WBI Energy's Line Section 25, approximately 9.4 miles of new 12-inch-diameter natural gas pipeline looping along WBI Energy's Line Section 30, approximately 0.5 mile of new 20-inch-diameter receipt lateral to the Tioga Compressor Station, and uprating of WBI Energy's Line Section 25. The Project includes additional horsepower at the Tioga Compressor Station; the installation of new and modifications to existing delivery, receipt and transfer stations along WBI Energy's pipeline routes; the replacement of small segments of pipeline facilities; and the installation of block valves, pig launcher/receiver stations and other associated appurtenances.

The Project will require crossing of the Lake Sakakawea Reservoir, which is managed by the U.S. Army Corps of Engineers (USACE), along with USACE-owned lands adjacent to Lake Sakakawea. WBI Energy proposes to install the natural gas pipeline under Lake Sakakawea and USACE lands using the horizontal directional drill (HDD) construction method, a trenchless method designed to avoid direct impacts to sensitive features. The HDD workspaces will be located adjacent to USACE-owned lands on the north side of the lake, and approximately 800 feet from USACE-owned lands on the south side of Lake Sakakawea. No surface impact to USACE lands is anticipated for this Project during installation and operation of the pipeline; all known temporary surface impacts will be located outside of USACE lands.

Construction of the Project will be completed in adherence to the Federal Energy Regulatory Commission's *Upland Erosion Control, Revegetation, and Maintenance Plan* and *Wetland and Waterbody Construction and Mitigation Procedures*, which are attached for reference as Appendix A and B, respectively.

UPLAND EROSION CONTROL, REVEGETATION, AND MAINTENANCE PLAN (PLAN)

I. APPLICABILITY

A. The intent of this Plan is to assist project sponsors by identifying baseline mitigation measures for minimizing erosion and enhancing revegetation. Project sponsors shall specify in their applications for a new FERC authorization and in prior notice and advance notice filings, any individual measures in this Plan they consider unnecessary, technically infeasible, or unsuitable due to local conditions and fully describe any alternative measures they would use. Project sponsors shall also explain how those alternative measures would achieve a comparable level of mitigation.

Once a project is authorized, project sponsors can request further changes as variances to the measures in this Plan (or the applicant's approved plan). The Director of the Office of Energy Projects (Director) will consider approval of variances upon the project sponsor's written request, if the Director agrees that a variance:

1. provides equal or better environmental protection;

2. is necessary because a portion of this Plan is infeasible or unworkable based on project-specific conditions; or

3. is specifically required in writing by another federal, state, or Native American land management agency for the portion of the project on its land or under its jurisdiction.

Sponsors of projects planned for construction under the automatic authorization provisions in the FERC's regulations must receive written approval for any variances in advance of construction.

Project-related impacts on wetland and waterbody systems are addressed in the staff's Wetland and Waterbody Construction and Mitigation Procedures (Procedures).

II. SUPERVISION AND INSPECTION

A. ENVIRONMENTAL INSPECTION

1. At least one Environmental Inspector is required for each construction spread during construction and restoration (as defined by section V). The number and experience of Environmental Inspectors assigned to each construction spread shall be appropriate for the length of the construction spread and the number/significance of resources affected.

2. Environmental Inspectors shall have peer status with all other activity inspectors.

3. Environmental Inspectors shall have the authority to stop activities that violate the environmental conditions of the FERC's Orders, stipulations of other environmental permits or approvals, or landowner easement agreements; and to order appropriate corrective action.

B. RESPONSIBILITIES OF ENVIRONMENTAL INSPECTORS

At a minimum, the Environmental Inspector(s) shall be responsible for:

1. Inspecting construction activities for compliance with the requirements of this Plan, the Procedures, the environmental conditions of the FERC's Orders, the mitigation measures proposed by the project sponsor (as approved and/or modified by the Order), other environmental permits and approvals, and environmental requirements in landowner easement agreements.

2. Identifying, documenting, and overseeing corrective actions, as necessary to bring an activity back into compliance;

3. Verifying that the limits of authorized construction work areas and locations of access roads are visibly marked before clearing, and maintained throughout construction;

4. Verifying the location of signs and highly visible flagging marking the boundaries of sensitive resource areas, waterbodies, wetlands, or areas with special requirements along the construction work area;

5. Identifying erosion/sediment control and soil stabilization needs in all areas;

6. Ensuring that the design of slope breakers will not cause erosion or direct water into sensitive environmental resource areas, including cultural resource sites, wetlands, waterbodies, and sensitive species habitats;

7. Verifying that dewatering activities are properly monitored and do not result in the deposition of sand, silt, and/or sediment into sensitive environmental resource areas, including wetlands, waterbodies, cultural resource sites, and sensitive species habitats; stopping dewatering activities if such deposition is occurring and ensuring the design of the discharge is changed to prevent reoccurrence; and verifying that dewatering structures are removed after completion of dewatering activities;

8. Ensuring that subsoil and topsoil are tested in agricultural and residential areas to measure compaction and determine the need for corrective action;

9. Advising the Chief Construction Inspector when environmental conditions (such as wet weather or frozen soils) make it advisable to restrict or delay construction activities to avoid topsoil mixing or excessive compaction;

10. Ensuring restoration of contours and topsoil;

11. Verifying that the soils imported for agricultural or residential use are certified as free of noxious weeds and soil pests, unless otherwise approved by the landowner;

12. Ensuring that erosion control devices are properly installed to prevent sediment flow into sensitive environmental resource areas (e.g., wetlands, waterbodies, cultural resource sites, and sensitive species habitats) and onto roads, and determining the need for additional erosion control devices;

13. Inspecting and ensuring the maintenance of temporary erosion control measures at least:

    a. on a daily basis in areas of active construction or equipment operation;

    b. on a weekly basis in areas with no construction or equipment operation; and

    c. within 24 hours of each 0.5 inch of rainfall;

14. Ensuring the repair of all ineffective temporary erosion control measures within 24 hours of identification, or as soon as conditions allow if compliance with this time frame would result in greater environmental impacts;

15. Keeping records of compliance with the environmental conditions of the FERC's Orders, and the mitigation measures proposed by the project sponsor in the application submitted to the FERC, and other federal or state environmental permits during active construction and restoration;

16. Identifying areas that should be given special attention to ensure stabilization and restoration after the construction phase; and

17. Verifying that locations for any disposal of excess construction materials for beneficial reuse comply with section III.E.

III. PRECONSTRUCTION PLANNING

The project sponsor shall do the following before construction:

A. CONSTRUCTION WORK AREAS

1. Identify all construction work areas (e.g., construction right-of-way, extra work space areas, pipe storage and contractor yards, borrow and disposal areas, access roads) that would be needed for safe construction. The project sponsor must ensure that appropriate cultural resources and biological surveys are conducted, as determined necessary by the appropriate federal and state agencies.

2. Project sponsors are encouraged to consider expanding any required cultural resources and endangered species surveys in anticipation of the need for activities outside of authorized work areas.

3. Plan construction sequencing to limit the amount and duration of open trench sections, as necessary, to prevent excessive erosion or sediment flow into sensitive environmental resource areas.

B. DRAIN TILE AND IRRIGATION SYSTEMS

1. Attempt to locate existing drain tiles and irrigation systems.

2. Contact landowners and local soil conservation authorities to determine the locations of future drain tiles that are likely to be installed within 3 years of the authorized construction.

3. Develop procedures for constructing through drain-tiled areas, maintaining irrigation systems during construction, and repairing drain tiles and irrigation systems after construction.

4. Engage qualified drain tile specialists, as needed to conduct or monitor repairs to drain tile systems affected by construction. Use drain tile specialists from the project area, if available.

C. GRAZING DEFERMENT

Develop grazing deferment plans with willing landowners, grazing permittees, and land management agencies to minimize grazing disturbance of revegetation efforts.

D. ROAD CROSSINGS AND ACCESS POINTS

Plan for safe and accessible conditions at all roadway crossings and access points during construction and restoration.

E. DISPOSAL PLANNING

Determine methods and locations for the regular collection, containment, and disposal of excess construction materials and debris (e.g., timber, slash, mats, garbage, drill cuttings and fluids, excess rock) throughout the construction process. Disposal of materials for beneficial reuse must not result in adverse environmental impact and is subject to compliance with all applicable survey, landowner or land management agency approval, and permit requirements.

F. AGENCY COORDINATION

The project sponsor must coordinate with the appropriate local, state, and federal agencies as outlined in this Plan and/or required by the FERC's Orders.

1. Obtain written recommendations from the local soil conservation authorities or land management agencies regarding permanent erosion control and revegetation specifications.

2. Develop specific procedures in coordination with the appropriate agencies to prevent the introduction or spread of invasive species, noxious weeds, and soil pests resulting from construction and restoration activities.

3. Develop specific procedures in coordination with the appropriate agencies and landowners, as necessary, to allow for livestock and wildlife movement and protection during construction.

4. Develop specific blasting procedures in coordination with the appropriate agencies that address pre- and post-blast inspections; advanced public notification; and mitigation measures for building foundations, groundwater wells, and springs. Use appropriate methods (e.g., blasting mats) to prevent damage to nearby structures and to prevent debris from entering sensitive environmental resource areas.

G. SPILL PREVENTION AND RESPONSE PROCEDURES

The project sponsor shall develop project-specific Spill Prevention and Response Procedures, as specified in section IV of the staff's Procedures. A copy must be filed with the Secretary of the FERC (Secretary) prior to construction and made available in the field on each construction spread. The filing requirement does not apply to projects constructed under the automatic authorization provisions in the FERC's regulations.

H. RESIDENTIAL CONSTRUCTION

For all properties with residences located within 50 feet of construction work areas, project sponsors shall: avoid removal of mature trees and landscaping within the construction work area unless necessary for safe operation of construction equipment, or as specified in landowner agreements; fence the edge of the construction work area for a distance of 100 feet on either side of the residence; and restore all lawn areas and landscaping immediately following clean up operations, or as specified in landowner agreements. If seasonal or other weather conditions prevent compliance with these time frames, maintain and monitor temporary erosion controls (sediment barriers and mulch) until conditions allow completion of restoration.

I. WINTER CONSTRUCTION PLANS

If construction is planned to occur during winter weather conditions, project sponsors shall develop and file a project-specific winter construction plan with the FERC application. This filing requirement does not apply to projects constructed under the automatic authorization provisions of the FERC's regulations.

The plan shall address:

1. winter construction procedures (e.g., snow handling and removal, access road construction and maintenance, soil handling under saturated or frozen conditions, topsoil stripping);

2. stabilization and monitoring procedures if ground conditions will delay restoration until the following spring (e.g., mulching and erosion controls, inspection and reporting, stormwater control during spring thaw conditions); and

3. final restoration procedures (e.g., subsidence and compaction repair, topsoil replacement, seeding).

IV. INSTALLATION

A. APPROVED AREAS OF DISTURBANCE

1. Project-related ground disturbance shall be limited to the construction right-of-way, extra work space areas, pipe storage yards, borrow and disposal areas, access roads, and other areas approved in the FERC's Orders. Any project-related ground disturbing activities outside these areas will require prior Director approval. This requirement does not apply to activities needed to comply with the Plan and Procedures (i.e., slope breakers, energy-dissipating devices, dewatering structures, drain tile system repairs) or minor field realignments and workspace shifts per landowner needs and requirements that do not affect other landowners or sensitive environmental resource areas. All construction or restoration activities outside of authorized areas are subject to all applicable survey and permit requirements, and landowner easement agreements.

2. The construction right-of-way width for a project shall not exceed 75 feet or that described in the FERC application unless otherwise modified by a FERC Order. However, in limited, non-wetland areas, this construction right-of-way width may be expanded by up to 25 feet without Director approval to accommodate full construction right-of-way topsoil segregation and to ensure safe construction where topographic conditions (e.g., side-slopes) or soil limitations require it. Twenty-five feet of extra construction right-of-way width may also be used in limited, non-wetland or non-forested areas for truck turn-arounds where no reasonable alternative access exists.

   Project use of these additional limited areas is subject to landowner or land management agency approval and compliance with all applicable survey and permit requirements. When additional areas are used, each one shall be identified and the need explained in the weekly or biweekly construction reports to the FERC, if required. The following material shall be included in the reports:

   a. the location of each additional area by station number and reference to previously filed alignment sheets, or updated alignment sheets showing the additional areas;

   b. identification of the filing at FERC containing evidence that the additional areas were previously surveyed; and

c. a statement that landowner approval has been obtained and is available in project files.

Prior written approval of the Director is required when the authorized construction right-of-way width would be expanded by more than 25 feet.

B. TOPSOIL SEGREGATION

1. Unless the landowner or land management agency specifically approves otherwise, prevent the mixing of topsoil with subsoil by stripping topsoil from either the full work area or from the trench and subsoil storage area (ditch plus spoil side method) in:

   a. cultivated or rotated croplands, and managed pastures;

   b. residential areas;

   c. hayfields; and

   d. other areas at the landowner's or land managing agency's request.

2. In residential areas, importation of topsoil is an acceptable alternative to topsoil segregation.

3. Where topsoil segregation is required, the project sponsor must:

   a. segregate at least 12 inches of topsoil in deep soils (more than 12 inches of topsoil); and

   b. make every effort to segregate the entire topsoil layer in soils with less than 12 inches of topsoil.

4. Maintain separation of salvaged topsoil and subsoil throughout all construction activities.

5. Segregated topsoil may not be used for padding the pipe, constructing temporary slope breakers or trench plugs, improving or maintaining roads, or as a fill material.

6. Stabilize topsoil piles and minimize loss due to wind and water erosion with use of sediment barriers, mulch, temporary seeding, tackifiers, or functional equivalents, where necessary.

C. DRAIN TILES

1. Mark locations of drain tiles damaged during construction.

2. Probe all drainage tile systems within the area of disturbance to check for damage.

3. Repair damaged drain tiles to their original or better condition. Do not use filter-covered drain tiles unless the local soil conservation authorities and the landowner agree. Use qualified specialists for testing and repairs.

4. For new pipelines in areas where drain tiles exist or are planned, ensure that the depth of cover over the pipeline is sufficient to avoid interference with drain tile systems. For adjacent pipeline loops in agricultural areas, install the new pipeline with at least the same depth of cover as the existing pipeline(s).

D. IRRIGATION

Maintain water flow in crop irrigation systems, unless shutoff is coordinated with affected parties.

E. ROAD CROSSINGS AND ACCESS POINTS

1. Maintain safe and accessible conditions at all road crossings and access points during construction.

2. If crushed stone access pads are used in residential or agricultural areas, place the stone on synthetic fabric to facilitate removal.

3. Minimize the use of tracked equipment on public roadways. Remove any soil or gravel spilled or tracked onto roadways daily or more frequent as necessary to maintain safe road conditions. Repair any damages to roadway surfaces, shoulders, and bar ditches.

F. TEMPORARY EROSION CONTROL

Install temporary erosion controls immediately after initial disturbance of the soil. Temporary erosion controls must be properly maintained throughout construction (on a daily basis) and reinstalled as necessary (such as after backfilling of the trench) until replaced by permanent erosion controls or restoration is complete.

1. Temporary Slope Breakers

   a. Temporary slope breakers are intended to reduce runoff velocity and divert water off the construction right-of-way. Temporary slope

breakers may be constructed of materials such as soil, silt fence, staked hay or straw bales, or sand bags.

b. Install temporary slope breakers on all disturbed areas, as necessary to avoid excessive erosion. Temporary slope breakers must be installed on slopes greater than 5 percent where the base of the slope is less than 50 feet from waterbody, wetland, and road crossings at the following spacing (closer spacing shall be used if necessary):

Slope (%)	Spacing (feet)
5 - 15	300
>15 - 30	200
>30	100

c. Direct the outfall of each temporary slope breaker to a stable, well vegetated area or construct an energy-dissipating device at the end of the slope breaker and off the construction right-of-way.

d. Position the outfall of each temporary slope breaker to prevent sediment discharge into wetlands, waterbodies, or other sensitive environmental resource areas.

2. Temporary Trench Plugs

Temporary trench plugs are intended to segment a continuous open trench prior to backfill.

a. Temporary trench plugs may consist of unexcavated portions of the trench, compacted subsoil, sandbags, or some functional equivalent.

b. Position temporary trench plugs, as necessary, to reduce trenchline erosion and minimize the volume and velocity of trench water flow at the base of slopes.

3. Sediment Barriers

Sediment barriers are intended to stop the flow of sediments and to prevent the deposition of sediments beyond approved workspaces or into sensitive resources.

a. Sediment barriers may be constructed of materials such as silt fence, staked hay or straw bales, compacted earth (e.g., driveable berms across travelways), sand bags, or other appropriate materials.

b. At a minimum, install and maintain temporary sediment barriers across the entire construction right-of-way at the base of slopes greater than 5 percent where the base of the slope is less than 50 feet from a waterbody, wetland, or road crossing until revegetation is successful as defined in this Plan. Leave adequate room between the base of the slope and the sediment barrier to accommodate ponding of water and sediment deposition.

c. Where wetlands or waterbodies are adjacent to and downslope of construction work areas, install sediment barriers along the edge of these areas, as necessary to prevent sediment flow into the wetland or waterbody.

4. Mulch

a. Apply mulch on all slopes (except in cultivated cropland) concurrent with or immediately after seeding, where necessary to stabilize the soil surface and to reduce wind and water erosion. Spread mulch uniformly over the area to cover at least 75 percent of the ground surface at a rate of 2 tons/acre of straw or its equivalent, unless the local soil conservation authority, landowner, or land managing agency approves otherwise in writing.

b. Mulch can consist of weed-free straw or hay, wood fiber hydromulch, erosion control fabric, or some functional equivalent.

c. Mulch all disturbed upland areas (except cultivated cropland) before seeding if:

(1) final grading and installation of permanent erosion control measures will not be completed in an area within 20 days after the trench in that area is backfilled (10 days in residential areas), as required in section V.A.1; or

(2) construction or restoration activity is interrupted for extended periods, such as when seeding cannot be completed due to seeding period restrictions.

d. If mulching before seeding, increase mulch application on all slopes within 100 feet of waterbodies and wetlands to a rate of 3 tons/acre of straw or equivalent.

e. If wood chips are used as mulch, do not use more than 1 ton/acre and add the equivalent of 11 lbs/acre available nitrogen (at least 50 percent of which is slow release).

f. Ensure that mulch is adequately anchored to minimize loss due to wind and water.

g. When anchoring with liquid mulch binders, use rates recommended by the manufacturer. Do not use liquid mulch binders within 100 feet of wetlands or waterbodies, except where the product is certified environmentally non-toxic by the appropriate state or federal agency or independent standards-setting organization.

h. Do not use synthetic monofilament mesh/netted erosion control materials in areas designated as sensitive wildlife habitat, unless the product is specifically designed to minimize harm to wildlife. Anchor erosion control fabric with staples or other appropriate devices.

V. RESTORATION

A. CLEANUP

1. Commence cleanup operations immediately following backfill operations. Complete final grading, topsoil replacement, and installation of permanent erosion control structures within 20 days after backfilling the trench (10 days in residential areas). If seasonal or other weather conditions prevent compliance with these time frames, maintain temporary erosion controls (i.e., temporary slope breakers, sediment barriers, and mulch) until conditions allow completion of cleanup.

   If construction or restoration unexpectedly continues into the winter season when conditions could delay successful decompaction, topsoil replacement, or seeding until the following spring, file with the Secretary for the review and written approval of the Director, a winter construction plan (as specified in section III.I). This filing requirement does not apply to projects constructed under the automatic authorization provisions of the FERC's regulations.

2. A travel lane may be left open temporarily to allow access by construction traffic if the temporary erosion control structures are installed as specified in section IV.F. and inspected and maintained as specified in sections II.B.12 through 14. When access is no longer required the travel lane must be removed and the right-of-way restored.

3. Rock excavated from the trench may be used to backfill the trench only to the top of the existing bedrock profile. Rock that is not returned to the trench shall be considered construction debris, unless approved for use as mulch or for some other use on the construction work areas by the landowner or land managing agency.

4. Remove excess rock from at least the top 12 inches of soil in all cultivated or rotated cropland, managed pastures, hayfields, and residential areas, as well as other areas at the landowner's request. The size, density, and distribution of rock on the construction work area shall be similar to adjacent areas not disturbed by construction. The landowner or land management agency may approve other provisions in writing.

5. Grade the construction right-of-way to restore pre-construction contours and leave the soil in the proper condition for planting.

6. Remove construction debris from all construction work areas unless the landowner or land managing agency approves leaving materials onsite for beneficial reuse, stabilization, or habitat restoration.

7. Remove temporary sediment barriers when replaced by permanent erosion control measures or when revegetation is successful.

B. PERMANENT EROSION CONTROL DEVICES

1. Trench Breakers

a. Trench breakers are intended to slow the flow of subsurface water along the trench. Trench breakers may be constructed of materials such as sand bags or polyurethane foam. Do not use topsoil in trench breakers.

b. An engineer or similarly qualified professional shall determine the need for and spacing of trench breakers. Otherwise, trench breakers shall be installed at the same spacing as and upslope of permanent slope breakers.

c. In agricultural fields and residential areas where slope breakers are not typically required, install trench breakers at the same spacing as if permanent slope breakers were required.

d. At a minimum, install a trench breaker at the base of slopes greater than 5 percent where the base of the slope is less than 50 feet from a waterbody or wetland and where needed to avoid draining a waterbody or wetland. Install trench breakers at wetland boundaries, as specified in the Procedures. Do not install trench breakers within a wetland.

2. Permanent Slope Breakers

a. Permanent slope breakers are intended to reduce runoff velocity, divert water off the construction right-of-way, and prevent sediment deposition into sensitive resources. Permanent slope breakers may be constructed of materials such as soil, stone, or some functional equivalent.

b. Construct and maintain permanent slope breakers in all areas, except cultivated areas and lawns, unless requested by the landowner, using spacing recommendations obtained from the local soil conservation authority or land managing agency.

In the absence of written recommendations, use the following spacing unless closer spacing is necessary to avoid excessive erosion on the construction right-of-way:

Slope (%)	Spacing (feet)
5 - 15	300
>15 - 30	200
>30	100

c. Construct slope breakers to divert surface flow to a stable area without causing water to pool or erode behind the breaker. In the absence of a stable area, construct appropriate energy-dissipating devices at the end of the breaker.

d. Slope breakers may extend slightly (about 4 feet) beyond the edge of the construction right-of-way to effectively drain water off the disturbed area. Where slope breakers extend beyond the edge of the construction right-of-way, they are subject to compliance with all applicable survey requirements.

C. SOIL COMPACTION MITIGATION

1. Test topsoil and subsoil for compaction at regular intervals in agricultural and residential areas disturbed by construction activities. Conduct tests on the same soil type under similar moisture conditions in undisturbed areas to approximate preconstruction conditions. Use penetrometers or other appropriate devices to conduct tests.

2. Plow severely compacted agricultural areas with a paraplow or other deep tillage implement. In areas where topsoil has been segregated, plow the subsoil before replacing the segregated topsoil.

If subsequent construction and cleanup activities result in further compaction, conduct additional tilling.

3. Perform appropriate soil compaction mitigation in severely compacted residential areas.

D. REVEGETATION

1. General

a. The project sponsor is responsible for ensuring successful revegetation of soils disturbed by project-related activities, except as noted in section V.D.1.b.

b. Restore all turf, ornamental shrubs, and specialized landscaping in accordance with the landowner's request, or compensate the landowner. Restoration work must be performed by personnel familiar with local horticultural and turf establishment practices.

2. Soil Additives

Fertilize and add soil pH modifiers in accordance with written recommendations obtained from the local soil conservation authority, land management agencies, or landowner. Incorporate recommended soil pH modifier and fertilizer into the top 2 inches of soil as soon as practicable after application.

3. Seeding Requirements

a. Prepare a seedbed in disturbed areas to a depth of 3 to 4 inches using appropriate equipment to provide a firm seedbed. When hydroseeding, scarify the seedbed to facilitate lodging and germination of seed.

b. Seed disturbed areas in accordance with written recommendations for seed mixes, rates, and dates obtained from the local soil conservation authority or the request of the landowner or land management agency. Seeding is not required in cultivated croplands unless requested by the landowner.

c. Perform seeding of permanent vegetation within the recommended seeding dates. If seeding cannot be done within those dates, use appropriate temporary erosion control measures discussed in section IV.F and perform seeding of permanent vegetation at the beginning of the next recommended seeding season. Dormant seeding or temporary

seeding of annual species may also be used, if necessary, to establish cover, as approved by the Environmental Inspector. Lawns may be seeded on a schedule established with the landowner.

d. In the absence of written recommendations from the local soil conservation authorities, seed all disturbed soils within 6 working days of final grading, weather and soil conditions permitting, subject to the specifications in section V.D.3.a through V.D.3.c.

e. Base seeding rates on Pure Live Seed. Use seed within 12 months of seed testing.

f. Treat legume seed with an inoculant specific to the species using the manufacturer's recommended rate of inoculant appropriate for the seeding method (broadcast, drill, or hydro).

g. In the absence of written recommendations from the local soil conservation authorities, landowner, or land managing agency to the contrary, a seed drill equipped with a cultipacker is preferred for seed application.

Broadcast or hydroseeding can be used in lieu of drilling at double the recommended seeding rates. Where seed is broadcast, firm the seedbed with a cultipacker or roller after seeding. In rocky soils or where site conditions may limit the effectiveness of this equipment, other alternatives may be appropriate (e.g., use of a chain drag) to lightly cover seed after application, as approved by the Environmental Inspector.

VI. OFF-ROAD VEHICLE CONTROL

To each owner or manager of forested lands, offer to install and maintain measures to control unauthorized vehicle access to the right-of-way. These measures may include:

A. signs;

B. fences with locking gates;

C. slash and timber barriers, pipe barriers, or a line of boulders across the right-of-way; and

D. conifers or other appropriate trees or shrubs across the right-of-way.

VII. POST-CONSTRUCTION ACTIVITIES AND REPORTING

A. MONITORING AND MAINTENANCE

1. Conduct follow-up inspections of all disturbed areas, as necessary, to determine the success of revegetation and address landowner concerns. At a minimum, conduct inspections after the first and second growing seasons.

2. Revegetation in non-agricultural areas shall be considered successful if upon visual survey the density and cover of non-nuisance vegetation are similar in density and cover to adjacent undisturbed lands. In agricultural areas, revegetation shall be considered successful when upon visual survey, crop growth and vigor are similar to adjacent undisturbed portions of the same field, unless the easement agreement specifies otherwise.

   Continue revegetation efforts until revegetation is successful.

3. Monitor and correct problems with drainage and irrigation systems resulting from pipeline construction in agricultural areas until restoration is successful.

4. Restoration shall be considered successful if the right-of-way surface condition is similar to adjacent undisturbed lands, construction debris is removed (unless otherwise approved by the landowner or land managing agency per section V.A.6), revegetation is successful, and proper drainage has been restored.

5. Routine vegetation mowing or clearing over the full width of the permanent right-of-way in uplands shall not be done more frequently than every 3 years. However, to facilitate periodic corrosion/leak surveys, a corridor not exceeding 10 feet in width centered on the pipeline may be cleared at a frequency necessary to maintain the 10-foot corridor in an herbaceous state. In no case shall routine vegetation mowing or clearing occur during the migratory bird nesting season between April 15 and August 1 of any year unless specifically approved in writing by the responsible land management agency or the U.S. Fish and Wildlife Service.

6. Efforts to control unauthorized off-road vehicle use, in cooperation with the landowner, shall continue throughout the life of the project. Maintain signs, gates, and permanent access roads as necessary.

B. REPORTING

1. The project sponsor shall maintain records that identify by milepost:

   a. method of application, application rate, and type of fertilizer, pH modifying agent, seed, and mulch used;

   b. acreage treated;

   c. dates of backfilling and seeding;

   d. names of landowners requesting special seeding treatment and a description of the follow-up actions;

   e. the location of any subsurface drainage repairs or improvements made during restoration; and

   f. any problem areas and how they were addressed.

2. The project sponsor shall file with the Secretary quarterly activity reports documenting the results of follow-up inspections required by section VII.A.1; any problem areas, including those identified by the landowner; and corrective actions taken for at least 2 years following construction.

   The requirement to file quarterly activity reports with the Secretary does not apply to projects constructed under the automatic authorization, prior notice, or advanced notice provisions in the FERC's regulations.

WETLAND AND WATERBODY
CONSTRUCTION AND MITIGATION PROCEDURES (PROCEDURES)

I. APPLICABILITY

A. The intent of these Procedures is to assist project sponsors by identifying baseline mitigation measures for minimizing the extent and duration of project-related disturbance on wetlands and waterbodies. Project sponsors shall specify in their applications for a new FERC authorization, and in prior notice and advance notice filings, any individual measures in these Procedures they consider unnecessary, technically infeasible, or unsuitable due to local conditions and fully describe any alternative measures they would use. Project sponsors shall also explain how those alternative measures would achieve a comparable level of mitigation.

Once a project is authorized, project sponsors can request further changes as variances to the measures in these Procedures (or the applicant's approved procedures). The Director of the Office of Energy Projects (Director) will consider approval of variances upon the project sponsor's written request, if the Director agrees that a variance:

1. provides equal or better environmental protection;

2. is necessary because a portion of these Procedures is infeasible or unworkable based on project-specific conditions; or

3. is specifically required in writing by another federal, state, or Native American land management agency for the portion of the project on its land or under its jurisdiction.

Sponsors of projects planned for construction under the automatic authorization provisions in the FERC's regulations must receive written approval for any variances in advance of construction.

Project-related impacts on non-wetland areas are addressed in the staff's Upland Erosion Control, Revegetation, and Maintenance Plan (Plan).

B. DEFINITIONS

1. "Waterbody" includes any natural or artificial stream, river, or drainage with perceptible flow at the time of crossing, and other permanent waterbodies such as ponds and lakes:

   a. "minor waterbody" includes all waterbodies less than or equal to 10 feet wide at the water's edge at the time of crossing;

   b. "intermediate waterbody" includes all waterbodies greater than 10 feet wide but less than or equal to 100 feet wide at the water's edge at the time of crossing; and

   c. "major waterbody" includes all waterbodies greater than 100 feet wide at the water's edge at the time of crossing.

2. "Wetland" includes any area that is not in actively cultivated or rotated cropland and that satisfies the requirements of the current federal methodology for identifying and delineating wetlands.

II. PRECONSTRUCTION FILING

A. The following information must be filed with the Secretary of the FERC (Secretary) prior to the beginning of construction, for the review and written approval by the Director:

1. site-specific justifications for extra work areas that would be closer than 50 feet from a waterbody or wetland; and

2. site-specific justifications for the use of a construction right-of-way greater than 75-feet-wide in wetlands.

B. The following information must be filed with the Secretary prior to the beginning of construction. These filing requirements do not apply to projects constructed under the automatic authorization provisions in the FERC's regulations:

1. Spill Prevention and Response Procedures specified in section IV.A;

2. a schedule identifying when trenching or blasting will occur within each waterbody greater than 10 feet wide, within any designated coldwater fishery, and within any waterbody identified as habitat for federally-listed threatened or endangered species. The project sponsor will revise the schedule as necessary to provide FERC staff at least 14 days advance notice. Changes within this last 14-day period must provide for at least 48 hours advance notice;

3. plans for horizontal directional drills (HDD) under wetlands or waterbodies, specified in section V.B.6.d;

4. site-specific plans for major waterbody crossings, described in section V.B.9;

5. a wetland delineation report as described in section VI.A.1, if applicable; and

6. the hydrostatic testing information specified in section VII.B.3.

III. ENVIRONMENTAL INSPECTORS

A. At least one Environmental Inspector having knowledge of the wetland and waterbody conditions in the project area is required for each construction spread. The number and experience of Environmental Inspectors assigned to each construction spread shall be appropriate for the length of the construction spread and the number/significance of resources affected.

B. The Environmental Inspector's responsibilities are outlined in the Upland Erosion Control, Revegetation, and Maintenance Plan (Plan).

IV. PRECONSTRUCTION PLANNING

A. The project sponsor shall develop project-specific Spill Prevention and Response Procedures that meet applicable requirements of state and federal agencies. A copy must be filed with the Secretary prior to construction and made available in the field on each construction spread. This filing requirement does not apply to projects constructed under the automatic authorization provisions in the FERC's regulations.

1. It shall be the responsibility of the project sponsor and its contractors to structure their operations in a manner that reduces the risk of spills or the accidental exposure of fuels or hazardous materials to waterbodies or wetlands. The project sponsor and its contractors must, at a minimum, ensure that:

a. all employees handling fuels and other hazardous materials are properly trained;

b. all equipment is in good operating order and inspected on a regular basis;

c. fuel trucks transporting fuel to on-site equipment travel only on approved access roads;

d. all equipment is parked overnight and/or fueled at least 100 feet from a waterbody or in an upland area at least 100 feet from a wetland boundary. These activities can occur closer only if the Environmental Inspector determines that there is no reasonable alternative, and the

project sponsor and its contractors have taken appropriate steps (including secondary containment structures) to prevent spills and provide for prompt cleanup in the event of a spill;

e. hazardous materials, including chemicals, fuels, and lubricating oils, are not stored within 100 feet of a wetland, waterbody, or designated municipal watershed area, unless the location is designated for such use by an appropriate governmental authority. This applies to storage of these materials and does not apply to normal operation or use of equipment in these areas;

f. concrete coating activities are not performed within 100 feet of a wetland or waterbody boundary, unless the location is an existing industrial site designated for such use. These activities can occur closer only if the Environmental Inspector determines that there is no reasonable alternative, and the project sponsor and its contractors have taken appropriate steps (including secondary containment structures) to prevent spills and provide for prompt cleanup in the event of a spill;

g. pumps operating within 100 feet of a waterbody or wetland boundary utilize appropriate secondary containment systems to prevent spills; and

h. bulk storage of hazardous materials, including chemicals, fuels, and lubricating oils have appropriate secondary containment systems to prevent spills.

2. The project sponsor and its contractors must structure their operations in a manner that provides for the prompt and effective cleanup of spills of fuel and other hazardous materials. At a minimum, the project sponsor and its contractors must:

a. ensure that each construction crew (including cleanup crews) has on hand sufficient supplies of absorbent and barrier materials to allow the rapid containment and recovery of spilled materials and knows the procedure for reporting spills and unanticipated discoveries of contamination;

b. ensure that each construction crew has on hand sufficient tools and material to stop leaks;

c. know the contact names and telephone numbers for all local, state, and federal agencies (including, if necessary, the U. S. Coast Guard and the National Response Center) that must be notified of a spill; and

d. follow the requirements of those agencies in cleaning up the spill, in excavating and disposing of soils or other materials contaminated by a spill, and in collecting and disposing of waste generated during spill cleanup.

B. AGENCY COORDINATION

The project sponsor must coordinate with the appropriate local, state, and federal agencies as outlined in these Procedures and in the FERC's Orders.

V. WATERBODY CROSSINGS

A. NOTIFICATION PROCEDURES AND PERMITS

1. Apply to the U.S. Army Corps of Engineers (COE), or its delegated agency, for the appropriate wetland and waterbody crossing permits.

2. Provide written notification to authorities responsible for potable surface water supply intakes located within 3 miles downstream of the crossing at least 1 week before beginning work in the waterbody, or as otherwise specified by that authority.

3. Apply for state-issued waterbody crossing permits and obtain individual or generic section 401 water quality certification or waiver.

4. Notify appropriate federal and state authorities at least 48 hours before beginning trenching or blasting within the waterbody, or as specified in applicable permits.

B. INSTALLATION

1. Time Window for Construction

Unless expressly permitted or further restricted by the appropriate federal or state agency in writing on a site-specific basis, instream work, except that required to install or remove equipment bridges, must occur during the following time windows:

a. coldwater fisheries - June 1 through September 30; and

b. coolwater and warmwater fisheries - June 1 through November 30.

2. Extra Work Areas

a. Locate all extra work areas (such as staging areas and additional spoil storage areas) at least 50 feet away from water's edge, except where

the adjacent upland consists of cultivated or rotated cropland or other disturbed land.

b. The project sponsor shall file with the Secretary for review and written approval by the Director, site-specific justification for each extra work area with a less than 50-foot setback from the water's edge, except where the adjacent upland consists of cultivated or rotated cropland or other disturbed land. The justification must specify the conditions that will not permit a 50-foot setback and measures to ensure the waterbody is adequately protected.

c. Limit the size of extra work areas to the minimum needed to construct the waterbody crossing.

3. General Crossing Procedures

a. Comply with the COE, or its delegated agency, permit terms and conditions.

b. Construct crossings as close to perpendicular to the axis of the waterbody channel as engineering and routing conditions permit.

c. Where pipelines parallel a waterbody, maintain at least 15 feet of undisturbed vegetation between the waterbody (and any adjacent wetland) and the construction right-of-way, except where maintaining this offset will result in greater environmental impact.

d. Where waterbodies meander or have multiple channels, route the pipeline to minimize the number of waterbody crossings.

e. Maintain adequate waterbody flow rates to protect aquatic life, and prevent the interruption of existing downstream uses.

f. Waterbody buffers (e.g., extra work area setbacks, refueling restrictions) must be clearly marked in the field with signs and/or highly visible flagging until construction-related ground disturbing activities are complete.

g. Crossing of waterbodies when they are dry or frozen and not flowing may proceed using standard upland construction techniques in accordance with the Plan, provided that the Environmental Inspector verifies that water is unlikely to flow between initial disturbance and final stabilization of the feature. In the event of perceptible flow, the project sponsor must comply with all applicable Procedure requirements for "waterbodies" as defined in section I.B.1.

4. Spoil Pile Placement and Control

   a. All spoil from minor and intermediate waterbody crossings, and upland spoil from major waterbody crossings, must be placed in the construction right-of-way at least 10 feet from the water's edge or in additional extra work areas as described in section V.B.2.

   b. Use sediment barriers to prevent the flow of spoil or silt-laden water into any waterbody.

5. Equipment Bridges

   a. Only clearing equipment and equipment necessary for installation of equipment bridges may cross waterbodies prior to bridge installation. Limit the number of such crossings of each waterbody to one per piece of clearing equipment.

   b. Construct and maintain equipment bridges to allow unrestricted flow and to prevent soil from entering the waterbody. Examples of such bridges include:

      (1) equipment pads and culvert(s);
      (2) equipment pads or railroad car bridges without culverts;
      (3) clean rock fill and culvert(s); and
      (4) flexi-float or portable bridges.

      Additional options for equipment bridges may be utilized that achieve the performance objectives noted above. Do not use soil to construct or stabilize equipment bridges.

   c. Design and maintain each equipment bridge to withstand and pass the highest flow expected to occur while the bridge is in place. Align culverts to prevent bank erosion or streambed scour. If necessary, install energy dissipating devices downstream of the culverts.

   d. Design and maintain equipment bridges to prevent soil from entering the waterbody.

   e. Remove temporary equipment bridges as soon as practicable after permanent seeding.

   f. If there will be more than 1 month between final cleanup and the beginning of permanent seeding and reasonable alternative access to the right-of-way is available, remove temporary equipment bridges as soon as practicable after final cleanup.

g. Obtain any necessary approval from the COE, or the appropriate state agency for permanent bridges.

6. Dry-Ditch Crossing Methods

a. Unless approved otherwise by the appropriate federal or state agency, install the pipeline using one of the dry-ditch methods outlined below for crossings of waterbodies up to 30 feet wide (at the water's edge at the time of construction) that are state-designated as either coldwater or significant coolwater or warmwater fisheries, or federally-designated as critical habitat.

b. Dam and Pump

(1) The dam-and-pump method may be used without prior approval for crossings of waterbodies where pumps can adequately transfer streamflow volumes around the work area, and there are no concerns about sensitive species passage.

(2) Implementation of the dam-and-pump crossing method must meet the following performance criteria:

(i) use sufficient pumps, including on-site backup pumps, to maintain downstream flows;
(ii) construct dams with materials that prevent sediment and other pollutants from entering the waterbody (e.g., sandbags or clean gravel with plastic liner);
(iii) screen pump intakes to minimize entrainment of fish;
(iv) prevent streambed scour at pump discharge; and
(v) continuously monitor the dam and pumps to ensure proper operation throughout the waterbody crossing.

c. Flume Crossing

The flume crossing method requires implementation of the following steps:

(1) install flume pipe after blasting (if necessary), but before any trenching;

(2) use sand bag or sand bag and plastic sheeting diversion structure or equivalent to develop an effective seal and to divert stream flow through the flume pipe (some modifications to the stream bottom may be required to achieve an effective seal);

(3) properly align flume pipe(s) to prevent bank erosion and streambed scour;

(4) do not remove flume pipe during trenching, pipelaying, or backfilling activities, or initial streambed restoration efforts; and

(5) remove all flume pipes and dams that are not also part of the equipment bridge as soon as final cleanup of the stream bed and bank is complete.

d. Horizontal Directional Drill

For each waterbody or wetland that would be crossed using the HDD method, file with the Secretary for the review and written approval by the Director, a plan that includes:

(1) site-specific construction diagrams that show the location of mud pits, pipe assembly areas, and all areas to be disturbed or cleared for construction;

(2) justification that disturbed areas are limited to the minimum needed to construct the crossing;

(3) identification of any aboveground disturbance or clearing between the HDD entry and exit workspaces during construction;

(4) a description of how an inadvertent release of drilling mud would be contained and cleaned up; and

(5) a contingency plan for crossing the waterbody or wetland in the event the HDD is unsuccessful and how the abandoned drill hole would be sealed, if necessary.

The requirement to file HDD plans does not apply to projects constructed under the automatic authorization provisions in the FERC's regulations.

7. Crossings of Minor Waterbodies

Where a dry-ditch crossing is not required, minor waterbodies may be crossed using the open-cut crossing method, with the following restrictions:

a. except for blasting and other rock breaking measures, complete instream construction activities (including trenching, pipe installation, backfill, and restoration of the streambed contours) within 24 hours.

Streambanks and unconsolidated streambeds may require additional restoration after this period;

b. limit use of equipment operating in the waterbody to that needed to construct the crossing; and

c. equipment bridges are not required at minor waterbodies that do not have a state-designated fishery classification or protected status (e.g., agricultural or intermittent drainage ditches). However, if an equipment bridge is used it must be constructed as described in section V.B.5.

8. Crossings of Intermediate Waterbodies

Where a dry-ditch crossing is not required, intermediate waterbodies may be crossed using the open-cut crossing method, with the following restrictions:

a. complete instream construction activities (not including blasting and other rock breaking measures) within 48 hours, unless site-specific conditions make completion within 48 hours infeasible;

b. limit use of equipment operating in the waterbody to that needed to construct the crossing; and

c. all other construction equipment must cross on an equipment bridge as specified in section V.B.5.

9. Crossings of Major Waterbodies

Before construction, the project sponsor shall file with the Secretary for the review and written approval by the Director a detailed, site-specific construction plan and scaled drawings identifying all areas to be disturbed by construction for each major waterbody crossing (the scaled drawings are not required for any offshore portions of pipeline projects). This plan must be developed in consultation with the appropriate state and federal agencies and shall include extra work areas, spoil storage areas, sediment control structures, etc., as well as mitigation for navigational issues. The requirement to file major waterbody crossing plans does not apply to projects constructed under the automatic authorization provisions of the FERC's regulations.

The Environmental Inspector may adjust the final placement of the erosion and sediment control structures in the field to maximize effectiveness.

10. Temporary Erosion and Sediment Control

Install sediment barriers (as defined in section IV.F.3.a of the Plan) immediately after initial disturbance of the waterbody or adjacent upland.

Sediment barriers must be properly maintained throughout construction and reinstalled as necessary (such as after backfilling of the trench) until replaced by permanent erosion controls or restoration of adjacent upland areas is complete. Temporary erosion and sediment control measures are addressed in more detail in the Plan; however, the following specific measures must be implemented at stream crossings:

a. install sediment barriers across the entire construction right-of-way at all waterbody crossings, where necessary to prevent the flow of sediments into the waterbody. Removable sediment barriers (or driveable berms) must be installed across the travel lane. These removable sediment barriers can be removed during the construction day, but must be re-installed after construction has stopped for the day and/or when heavy precipitation is imminent;

b. where waterbodies are adjacent to the construction right-of-way and the right-of-way slopes toward the waterbody, install sediment barriers along the edge of the construction right-of-way as necessary to contain spoil within the construction right-of-way and prevent sediment flow into the waterbody; and

c. use temporary trench plugs at all waterbody crossings, as necessary, to prevent diversion of water into upland portions of the pipeline trench and to keep any accumulated trench water out of the waterbody.

11. Trench Dewatering

Dewater the trench (either on or off the construction right-of-way) in a manner that does not cause erosion and does not result in silt-laden water flowing into any waterbody. Remove the dewatering structures as soon as practicable after the completion of dewatering activities.

C. RESTORATION

1. Use clean gravel or native cobbles for the upper 1 foot of trench backfill in all waterbodies that contain coldwater fisheries.

2. For open-cut crossings, stabilize waterbody banks and install temporary sediment barriers within 24 hours of completing instream construction activities. For dry-ditch crossings, complete streambed and bank stabilization before returning flow to the waterbody channel.

3. Return all waterbody banks to preconstruction contours or to a stable angle of repose as approved by the Environmental Inspector.

4. Install erosion control fabric or a functional equivalent on waterbody banks at the time of final bank recontouring. Do not use synthetic monofilament

mesh/netted erosion control materials in areas designated as sensitive wildlife habitat unless the product is specifically designed to minimize harm to wildlife. Anchor erosion control fabric with staples or other appropriate devices.

5. Application of riprap for bank stabilization must comply with COE, or its delegated agency, permit terms and conditions.

6. Unless otherwise specified by state permit, limit the use of riprap to areas where flow conditions preclude effective vegetative stabilization techniques such as seeding and erosion control fabric.

7. Revegetate disturbed riparian areas with native species of conservation grasses, legumes, and woody species, similar in density to adjacent undisturbed lands.

8. Install a permanent slope breaker across the construction right-of-way at the base of slopes greater than 5 percent that are less than 50 feet from the waterbody, or as needed to prevent sediment transport into the waterbody. In addition, install sediment barriers as outlined in the Plan.

   In some areas, with the approval of the Environmental Inspector, an earthen berm may be suitable as a sediment barrier adjacent to the waterbody.

9. Sections V.C.3 through V.C.7 above also apply to those perennial or intermittent streams not flowing at the time of construction.

D. POST-CONSTRUCTION MAINTENANCE

1. Limit routine vegetation mowing or clearing adjacent to waterbodies to allow a riparian strip at least 25 feet wide, as measured from the waterbody's mean high water mark, to permanently revegetate with native plant species across the entire construction right-of-way. However, to facilitate periodic corrosion/leak surveys, a corridor centered on the pipeline and up to 10 feet wide may be cleared at a frequency necessary to maintain the 10-foot corridor in an herbaceous state. In addition, trees that are located within 15 feet of the pipeline that have roots that could compromise the integrity of the pipeline coating may be cut and removed from the permanent right-of-way. Do not conduct any routine vegetation mowing or clearing in riparian areas that are between HDD entry and exit points.

2. Do not use herbicides or pesticides in or within 100 feet of a waterbody except as allowed by the appropriate land management or state agency.

3. Time of year restrictions specified in section VII.A.5 of the Plan (April 15 – August 1 of any year) apply to routine mowing and clearing of riparian areas.

VI. WETLAND CROSSINGS

A. GENERAL

1. The project sponsor shall conduct a wetland delineation using the current federal methodology and file a wetland delineation report with the Secretary before construction. The requirement to file a wetland delineation report does not apply to projects constructed under the automatic authorization provisions in the FERC's regulations.

   This report shall identify:

   a. by milepost all wetlands that would be affected;

   b. the National Wetlands Inventory (NWI) classification for each wetland;

   c. the crossing length of each wetland in feet; and

   d. the area of permanent and temporary disturbance that would occur in each wetland by NWI classification type.

   The requirements outlined in this section do not apply to wetlands in actively cultivated or rotated cropland. Standard upland protective measures, including workspace and topsoiling requirements, apply to these agricultural wetlands.

2. Route the pipeline to avoid wetland areas to the maximum extent possible. If a wetland cannot be avoided or crossed by following an existing right-of-way, route the new pipeline in a manner that minimizes disturbance to wetlands. Where looping an existing pipeline, overlap the existing pipeline right-of-way with the new construction right-of-way. In addition, locate the loop line no more than 25 feet away from the existing pipeline unless site-specific constraints would adversely affect the stability of the existing pipeline.

3. Limit the width of the construction right-of-way to 75 feet or less. Prior written approval of the Director is required where topographic conditions or soil limitations require that the construction right-of-way width within the boundaries of a federally delineated wetland be expanded beyond 75 feet. Early in the planning process the project sponsor is encouraged to identify site-specific areas where excessively wide trenches could occur and/or where spoil piles could be difficult to maintain because existing soils lack adequate unconfined compressive strength.

4. Wetland boundaries and buffers must be clearly marked in the field with signs and/or highly visible flagging until construction-related ground disturbing activities are complete.

5. Implement the measures of sections V and VI in the event a waterbody crossing is located within or adjacent to a wetland crossing. If all measures of sections V and VI cannot be met, the project sponsor must file with the Secretary a site-specific crossing plan for review and written approval by the Director before construction. This crossing plan shall address at a minimum:

   a. spoil control;

   b. equipment bridges;

   c. restoration of waterbody banks and wetland hydrology;

   d. timing of the waterbody crossing;

   e. method of crossing; and

   f. size and location of all extra work areas.

6. Do not locate aboveground facilities in any wetland, except where the location of such facilities outside of wetlands would prohibit compliance with U.S. Department of Transportation regulations.

B. INSTALLATION

1. Extra Work Areas and Access Roads

   a. Locate all extra work areas (such as staging areas and additional spoil storage areas) at least 50 feet away from wetland boundaries, except where the adjacent upland consists of cultivated or rotated cropland or other disturbed land.

   b. The project sponsor shall file with the Secretary for review and written approval by the Director, site-specific justification for each extra work area with a less than 50-foot setback from wetland boundaries, except where adjacent upland consists of cultivated or rotated cropland or other disturbed land. The justification must specify the site-specific conditions that will not permit a 50-foot setback and measures to ensure the wetland is adequately protected.

   c. The construction right-of-way may be used for access when the wetland soil is firm enough to avoid rutting or the construction right-of-way has been appropriately stabilized to avoid rutting (e.g., with timber riprap, prefabricated equipment mats, or terra mats).

      In wetlands that cannot be appropriately stabilized, all construction equipment other than that needed to install the wetland crossing shall

use access roads located in upland areas. Where access roads in upland areas do not provide reasonable access, limit all other construction equipment to one pass through the wetland using the construction right-of-way.

d. The only access roads, other than the construction right-of-way, that can be used in wetlands are those existing roads that can be used with no modifications or improvements, other than routine repair, and no impact on the wetland.

2. Crossing Procedures

a. Comply with COE, or its delegated agency, permit terms and conditions.

b. Assemble the pipeline in an upland area unless the wetland is dry enough to adequately support skids and pipe.

c. Use "push-pull" or "float" techniques to place the pipe in the trench where water and other site conditions allow.

d. Minimize the length of time that topsoil is segregated and the trench is open. Do not trench the wetland until the pipeline is assembled and ready for lowering in.

e. Limit construction equipment operating in wetland areas to that needed to clear the construction right-of-way, dig the trench, fabricate and install the pipeline, backfill the trench, and restore the construction right-of-way.

f. Cut vegetation just above ground level, leaving existing root systems in place, and remove it from the wetland for disposal.

The project sponsor can burn woody debris in wetlands, if approved by the COE and in accordance with state and local regulations, ensuring that all remaining woody debris is removed for disposal.

g. Limit pulling of tree stumps and grading activities to directly over the trenchline. Do not grade or remove stumps or root systems from the rest of the construction right-of-way in wetlands unless the Chief Inspector and Environmental Inspector determine that safety-related construction constraints require grading or the removal of tree stumps from under the working side of the construction right-of-way.

h. Segregate the top 1 foot of topsoil from the area disturbed by trenching, except in areas where standing water is present or soils are

saturated. Immediately after backfilling is complete, restore the segregated topsoil to its original location.

i. Do not use rock, soil imported from outside the wetland, tree stumps, or brush riprap to support equipment on the construction right-of-way.

j. If standing water or saturated soils are present, or if construction equipment causes ruts or mixing of the topsoil and subsoil in wetlands, use low-ground-weight construction equipment, or operate normal equipment on timber riprap, prefabricated equipment mats, or terra mats.

k. Remove all project-related material used to support equipment on the construction right-of-way upon completion of construction.

3. Temporary Sediment Control

Install sediment barriers (as defined in section IV.F.3.a of the Plan) immediately after initial disturbance of the wetland or adjacent upland. Sediment barriers must be properly maintained throughout construction and reinstalled as necessary (such as after backfilling of the trench). Except as noted below in section VI.B.3.c, maintain sediment barriers until replaced by permanent erosion controls or restoration of adjacent upland areas is complete. Temporary erosion and sediment control measures are addressed in more detail in the Plan.

a. Install sediment barriers across the entire construction right-of-way immediately upslope of the wetland boundary at all wetland crossings where necessary to prevent sediment flow into the wetland.

b. Where wetlands are adjacent to the construction right-of-way and the right-of-way slopes toward the wetland, install sediment barriers along the edge of the construction right-of-way as necessary to contain spoil within the construction right-of-way and prevent sediment flow into the wetland.

c. Install sediment barriers along the edge of the construction right-of-way as necessary to contain spoil and sediment within the construction right-of-way through wetlands. Remove these sediment barriers during right-of-way cleanup.

4. Trench Dewatering

Dewater the trench (either on or off the construction right-of-way) in a manner that does not cause erosion and does not result in silt-laden water flowing into any wetland. Remove the dewatering structures as soon as practicable after the completion of dewatering activities.

C. RESTORATION

1. Where the pipeline trench may drain a wetland, construct trench breakers at the wetland boundaries and/or seal the trench bottom as necessary to maintain the original wetland hydrology.

2. Restore pre-construction wetland contours to maintain the original wetland hydrology.

3. For each wetland crossed, install a trench breaker at the base of slopes near the boundary between the wetland and adjacent upland areas. Install a permanent slope breaker across the construction right-of-way at the base of slopes greater than 5 percent where the base of the slope is less than 50 feet from the wetland, or as needed to prevent sediment transport into the wetland. In addition, install sediment barriers as outlined in the Plan. In some areas, with the approval of the Environmental Inspector, an earthen berm may be suitable as a sediment barrier adjacent to the wetland.

4. Do not use fertilizer, lime, or mulch unless required in writing by the appropriate federal or state agency.

5. Consult with the appropriate federal or state agencies to develop a project-specific wetland restoration plan. The restoration plan shall include measures for re-establishing herbaceous and/or woody species, controlling the invasion and spread of invasive species and noxious weeds (e.g., purple loosestrife and phragmites), and monitoring the success of the revegetation and weed control efforts. Provide this plan to the FERC staff upon request.

6. Until a project-specific wetland restoration plan is developed and/or implemented, temporarily revegetate the construction right-of-way with annual ryegrass at a rate of 40 pounds/acre (unless standing water is present).

7. Ensure that all disturbed areas successfully revegetate with wetland herbaceous and/or woody plant species.

8. Remove temporary sediment barriers located at the boundary between wetland and adjacent upland areas after revegetation and stabilization of adjacent upland areas are judged to be successful as specified in section VII.A.4 of the Plan.

D. POST-CONSTRUCTION MAINTENANCE AND REPORTING

1. Do not conduct routine vegetation mowing or clearing over the full width of the permanent right-of-way in wetlands. However, to facilitate periodic corrosion/leak surveys, a corridor centered on the pipeline and up to 10 feet wide may be cleared at a frequency necessary to maintain the 10-foot corridor in an herbaceous state. In addition, trees within 15 feet of the pipeline with roots that could compromise the integrity of pipeline coating may be selectively cut and removed from the permanent right-of-way. Do not conduct any routine vegetation mowing or clearing in wetlands that are between HDD entry and exit points.

2. Do not use herbicides or pesticides in or within 100 feet of a wetland, except as allowed by the appropriate federal or state agency.

3. Time of year restrictions specified in section VII.A.5 of the Plan (April 15 – August 1 of any year) apply to routine mowing and clearing of wetland areas.

4. Monitor and record the success of wetland revegetation annually until wetland revegetation is successful.

5. Wetland revegetation shall be considered successful if all of the following criteria are satisfied:

   a. the affected wetland satisfies the current federal definition for a wetland (i.e., soils, hydrology, and vegetation);

   b. vegetation is at least 80 percent of either the cover documented for the wetland prior to construction, or at least 80 percent of the cover in adjacent wetland areas that were not disturbed by construction;

   c. if natural rather than active revegetation was used, the plant species composition is consistent with early successional wetland plant communities in the affected ecoregion; and

   d. invasive species and noxious weeds are absent, unless they are abundant in adjacent areas that were not disturbed by construction.

6. Within 3 years after construction, file a report with the Secretary identifying the status of the wetland revegetation efforts and documenting success as defined in section VI.D.5, above. The requirement to file wetland restoration reports with the Secretary does not apply to projects constructed under the automatic authorization, prior notice, or advance notice provisions in the FERC's regulations.

   For any wetland where revegetation is not successful at the end of 3 years after construction, develop and implement (in consultation with a

professional wetland ecologist) a remedial revegetation plan to actively revegetate wetlands. Continue revegetation efforts and file a report annually documenting progress in these wetlands until wetland revegetation is successful.

VII. HYDROSTATIC TESTING

A. NOTIFICATION PROCEDURES AND PERMITS

1. Apply for state-issued water withdrawal permits, as required.

2. Apply for National Pollutant Discharge Elimination System (NPDES) or state-issued discharge permits, as required.

3. Notify appropriate state agencies of intent to use specific sources at least 48 hours before testing activities unless they waive this requirement in writing.

B. GENERAL

1. Perform 100 percent radiographic inspection of all pipeline section welds or hydrotest the pipeline sections, before installation under waterbodies or wetlands.

2. If pumps used for hydrostatic testing are within 100 feet of any waterbody or wetland, address secondary containment and refueling of these pumps in the project's Spill Prevention and Response Procedures.

3. The project sponsor shall file with the Secretary before construction a list identifying the location of all waterbodies proposed for use as a hydrostatic test water source or discharge location. This filing requirement does not apply to projects constructed under the automatic authorization provisions of the FERC's regulations.

C. INTAKE SOURCE AND RATE

1. Screen the intake hose to minimize the potential for entrainment of fish.

2. Do not use state-designated exceptional value waters, waterbodies which provide habitat for federally listed threatened or endangered species, or waterbodies designated as public water supplies, unless appropriate federal, state, and/or local permitting agencies grant written permission.

3. Maintain adequate flow rates to protect aquatic life, provide for all waterbody uses, and provide for downstream withdrawals of water by existing users.

4. Locate hydrostatic test manifolds outside wetlands and riparian areas to the maximum extent practicable.

D. DISCHARGE LOCATION, METHOD, AND RATE

1. Regulate discharge rate, use energy dissipation device(s), and install sediment barriers, as necessary, to prevent erosion, streambed scour, suspension of sediments, or excessive streamflow.

2. Do not discharge into state-designated exceptional value waters, waterbodies which provide habitat for federally listed threatened or endangered species, or waterbodies designated as public water supplies, unless appropriate federal, state, and local permitting agencies grant written permission.

ACRONYMS AND ABBREVIATIONS

EI	Environmental Inspector
Project	North Bakken Expansion Project
SPCC Plan	Spill Prevention, Control, and Countermeasure Plan
WBI Energy	WBI Energy Transmission, Inc.

WBI ENERGY TRANSMISSION, INC.
NORTH BAKKEN EXPANSION PROJECT

1.0 INTRODUCTION

This Spill Prevention, Control, and Countermeasure Plan (SPCC Plan) was prepared for WBI Energy Transmission, Inc.'s (WBI Energy) proposed North Bakken Expansion Project (Project) to be implemented during construction of the Project. This SPCC Plan outlines specific preventive measures and practices to reduce the likelihood of an accidental release of a hazardous or regulated liquid and, in the event such a release occurs, to expedite the response to and remediation of the release.

This SPCC Plan restricts the location of fuel storage, fueling activities, and construction equipment maintenance along the construction right-of-way and provides procedures for these activities. Training and lines of communication to facilitate the prevention, response, containment, and cleanup of spills during construction activities are also described.

All contractor personnel working on the Project are responsible for implementation of the measures and procedures defined in this SPCC Plan. Contractors are expected to meet or exceed WBI Energy's standards for spill response, reporting, and cleanup. Contractors whose activities could result in a spill of fuel or other regulated or hazardous materials on the right-of-way will adopt the measures identified in this SPCC Plan. All measures outlined in this SPCC Plan are consistent with the applicable requirements of the Federal Energy Regulatory Commission's *Wetland and Waterbody Construction and Mitigation Procedures*.

This SPCC Plan will be updated to include information specific to the horizontal directional drill crossing of Lake Sakakawea once a contractor has been selected for the Project. A complete copy of the SPCC Plan shall be maintained on site. A copy of the SPCC Plan will be available for a review during normal working hours. *[Note: An updated version of this plan will be filed with the Federal Energy Regulatory Commission and the U.S. Army Corps of Engineers as more detailed information is finalized.]*

1.1 TRAINING

Experienced, well-trained staff are essential for the successful implementation of the SPCC Plan. Contractors will provide spill prevention training as well as safety training to their work crews. The training program will be designed to improve awareness of safety requirements, pollution control laws, and proper operation and maintenance of equipment. Contractors will train all employees who handle fuels and other regulated substances to prevent spills and to quickly and effectively contain and clean up spills in accordance with applicable regulations and the provisions of this plan.

1.2 ROLES AND RESPONSIBILITIES

1.2.1 Spill Coordinator

Contractors will appoint a Spill Coordinator who will be responsible for coordinating Contractor Work Crews for spill cleanup, conducting site investigations, and assisting with completing spill reports. The Spill Coordinator will report all spills to an Environmental Inspector

(EI). The Spill Coordinator will be responsible for completing WBI Energy's internal Spill Report Form as soon as possible but no later than the end of the work day that the spill occurred, regardless of the size of the spill. The Spill Report Form will be submitted to the WBI Energy Designated Representative.

Spill Coordinator:	[To Be Determined Prior to Construction]
Phone Number:	[To Be Determined Prior to Construction]

1.2.2 Contractor Work Crews

Contractor Work Crews will comply with this SPCC Plan and will notify the Spill Coordinator immediately of any spill of fuel or other regulated or hazardous material, regardless of the volume of the spill. Contractor Work Crews will assist with the cleanup of the spill as directed by the Spill Coordinator, if trained to do so.

1.2.3 Environmental Inspectors

The EIs will monitor the Contractors' compliance with the provisions of the SPCC Plan to ensure that spill resources are allocated and cleanup accomplished in accordance with this plan and any applicable regulatory requirements. The EIs will work in conjunction with WBI Energy's Designated Representative to promptly report spills to appropriate federal, state, and local agencies, as required, and to coordinate with these agencies regarding contacting additional parties or agencies.

Environmental Inspector:	[To Be Determined Prior to Construction]
Phone Number:	[To Be Determined Prior to Construction]

1.2.4 WBI Energy's Designated Representative

The Designated Representative has the authority to commit resources to implement this SPCC Plan. The Designated Representative will work in conjunction with the EIs to promptly report spills to appropriate federal, state, and local agencies.

ALL SPILLS, REGARDLESS OF SIZE, MUST BE REPORTED TO THE SPILL COORDINATOR AND ENVIRONMENTAL INSPECTORS

2.0 PREVENTATIVE MEASURES

Contractors will minimize the potential for a spill during construction activities at WBI Energy's facilities and on its right-of-way by implementing appropriate measures to prevent and contain spills. Equipment and materials will be located on site to meet the provisions of this SPCC Plan. The Contractor shall supply each construction crew with a quantity of absorbent and barrier materials sufficient to contain and recover spills that could potentially occur from the equipment with the largest on-board volume of fuel and lubricant. These materials may include, but are not limited to, drip pans, buckets, absorbent pads, containment booms, straw bales, absorbent clay, saw dust, floor drying agents, spill containment barriers, plastic sheeting, skimmer pumps, covered holding tanks, and fire extinguishers.

The Contractor shall make known to all construction personnel the locations of staging areas where spill response equipment and materials are stored, and have them readily accessible during construction. Contractors will comply with applicable environmental and safety laws and regulations and will ensure that a copy of this plan is available on site to all Construction Work Crew members.

In addition, periodic discussions between construction personnel and their supervisors must be held. These are conversations where problems in field operations are discussed and solved. This SPCC Plan, together with specific techniques, will be reviewed with the appropriate employees at a safety meeting before construction starts.

The contractor will provide, maintain, and make available the appropriate Safety Data Sheets for vehicle and equipment fuel, lubricating oil, and any other regulated or hazardous materials utilized for the Project.

The following sections describe spill prevention measures to be taken on Project locations.

2.1 PETROLEUM AND HAZARDOUS LIQUID STORAGE, REFUELING, AND EQUIPMENT MAINTENANCE

2.1.1 Staging Areas and Facility Sites:

- Contractors will construct temporary liners and seamless impermeable berms, or other appropriate containment, around aboveground storage containers so that liquids will be contained and collected in specified areas isolated from waterbodies in the event of a leak or spill. Storage containers will not be placed in areas subject to periodic flooding and washout.

- Contractors will visually inspect aboveground storage containers for leaks and spills frequently and whenever containers are refilled.

- Secondary containment structures must provide a containment volume equal to a minimum of 110 percent of the maximum storage volume of the largest storage container in the containment structure.

- Secondary containment structures must be constructed so that no outlet is provided and any spill will be contained within the containment structure. Accumulated rainwater may be removed if authorized by an EI. Accumulated water with a visible sheen will be collected for proper storage, transport and disposal.

- Contractors will remove all secondary containment structures at the conclusion of the Project. Contractors also will be responsible for returning any storage impoundment areas to original contours and appearance upon completion of the Project.

- Fuels and lubricants will be stored only at designated staging areas and in appropriate service vehicles. The storage areas will be located at least 100 feet away from edges of wetlands and waterbodies, at least 100 feet away from

designated municipal watershed areas, at least 200 feet away from private water supply wells, and at least 400 feet away from municipal water-supply wells unless a larger buffer is required by regulatory agencies.

- Storage containers will display labels that identify the contents of the container and whether the contents are hazardous. Contractors will maintain and provide to WBI Energy, when requested, copies of all Safety Data Sheets.

- Contractors will conduct routine equipment maintenance such as oil changes in staging areas, or as necessary in additional temporary workspace, and will dispose of waste oil in an appropriate manner (e.g. the Contractors will collect the waste oil in labeled, sealed containers and transport the waste oil to a recycling facility).

- Contractors will correct visible leaks in storage containers as soon as possible. Leaks outside of secondary containment, regardless of volume, will be reported to an EI.

- All fuel nozzles will be equipped with functional automatic shut-off valves.

- The drivers of tank trucks will be responsible for spill prevention and secondary containment during loading and unloading operations. Procedures for loading and unloading tank trucks will meet the minimum requirements established by applicable regulations. Drivers will observe and control the fueling operations at all times to prevent overfilling. Contractors will be responsible for training drivers of tank trucks to comply with these provisions.

- Prior to departure of any tank truck, all outlets of the vehicle will be closely examined by the driver for leakage and tightened, adjusted, or replaced, as necessary, to prevent liquid leakage while in transit. Contractors will be responsible for training drivers of tank trucks to comply with these provisions.

2.1.2 Project Right-of-Way

- All machinery will arrive on the right-of-way in a clean, washed condition, and free of fluid leaks.

- Contractors will wash, refuel, and service machinery at locations well away from any wetlands and waterbodies to prevent petroleum or chemical substances from entering surface waters.

- Overnight parking of equipment, as well as refueling and lubricating of construction equipment, will be restricted to upland areas at least 100 feet away from stream channels and wetlands, at least 200 feet from private water-supply wells, and at least 400 feet from municipal water-supply wells. Where this is not possible, and where an EI finds in advance no reasonable alternative, the equipment will be fueled by designated personnel with specific training in refueling, spill containment, and cleanup, under the supervision of an EI. Prior to refueling, appropriate steps will be taken (including deployment of secondary containment structures) to prevent spills and provide for prompt cleanup in the event of a spill.

- Fuel trucks transporting fuels to construction areas will only travel on approved access roads.

- Contractors will keep a spill kit on site in case of machinery leaks or spills.

2.1.3 Restricted Refueling Areas

Restricted refueling areas include areas where the appropriate buffer (e.g., 100 feet from a wetland or waterbody) cannot be maintained. All restricted refueling areas will be identified in the field with flagging or signs. A site-specific plan and written approval from an EI will be required to refuel in restricted areas.

- Approval must be received from an EI and, where necessary, appropriate regulatory permits must be obtained, prior to refueling in restricted refueling areas.

- In large wetlands where no upland site is available for refueling, auxiliary fuel tanks may be mounted to equipment to minimize the need for refueling.

- Trained personnel must be available for refueling, and an EI must be present unless a case-specific exemption is obtained in writing from WBI Energy's Designated Representative.

- Equipment such as large, stationary pumps will be fitted with auxiliary tanks as appropriate. The auxiliary tanks will be placed within secondary containment which provides for a containment volume equal to a minimum of 110 percent of the volume of the largest tank in the containment structure.

- Refueling within restricted refueling areas will take place only in areas designated by an EI. Fuel trucks with a capacity in excess of 300 gallons will not be allowed within a restricted refueling area unless adequate secondary containment is provided.

- Refueling of dewatering pumps, generators, and other small, portable equipment will be performed using approved containers with a maximum volume of 5 gallons.

- Fuel trucks will be prohibited from traveling on temporary equipment bridges at stream crossings. An EI may waive this restriction on a site-specific basis if a reasonable refueling option is not available. Such case-specific exemptions must be approved in writing by WBI Energy's Designated Representative.

2.2 SPILL RESPONSE EQUIPMENT

2.2.1 Staging Areas and Facility Sites

- Contractors will stock a sufficient supply of sorbent and barrier materials at construction staging areas to allow the rapid containment and recovery of spilled material. Sorbent and barrier materials will also be used to contain runoff from spill areas.

- Shovels and labeled drums will be kept at each of the individual staging areas. If small quantities of soil become contaminated within the staging area, they will be collected and placed in the drums. Large quantities of contaminated soil will be collected using heavy equipment and will be stored in drums, lined bermed areas, or other suitable containment, prior to disposal. The Contractors will dispose of all contaminated soil in accordance with applicable state and federal regulations.

2.2.2 Project Right-of-Way

- Each construction crew must have adequate absorbent materials and containment booms on hand to enable the rapid and complete cleanup of spills, as well as sufficient tools and materials to stop leaks.

- Contractors must maintain spill kits containing a sufficient quantity of absorbent and barrier materials to adequately contain and recover foreseeable spills. These kits may include, but are not limited to, absorbent pads, straw bales, absorbent clay, saw dust, floor drying agents, spill containment barriers, plastic sheeting, skimmer pumps, and drums. The equipment will be located near fuel storage areas and other locations as necessary to be readily available in the event of a spill.

- All fuel, and where possible, service trucks, will carry adequate spill response materials. Spill response materials present on trucks should consist of absorbent pads, absorbent material, plastic bags, and a shovel.

- The Spill Coordinator will inform an EI, and all Contractor personnel of the location of spill control equipment and materials, and have them readily accessible while construction activities are occurring.

2.3 CONCRETE COATING

Concrete coating activities will not be performed within 100 feet of a wetland or waterbody unless the location is an existing industrial site designated for such use.

3.0 STORAGE, CONTAINMENT AND FACILITY TRANSFER

All chemical storage containers, tanks, or barrels will be made of compatible materials with the appropriate temperature and pressure rating, overpressure protection, valving, and equalization lines necessary to comply with the appropriate state and federal regulations regarding storage of regulated substances. All chemicals, regardless of container size, will be stored in secondary containment or designated storage areas when not actively in use.

Fuel valves used for the final control of flow shall be of the self-closing type and shall be manually held open except were automatic means are provided for shutting off the flow when the vehicle is full.

Contaminated liquids inside containment areas will not be allowed to be drained outside the containment structures onto the ground or into any open water course. These liquids will be pumped or wiped out of containment structures and disposed of appropriately.

4.0 SPILL RESPONSE

Any employee who detects a spill incident while it is occurring should take the necessary measures to stop the flow but only if that employee has been trained to do so. If the employee is unprepared to effectively control the spill, caution and good judgment should be used as to personal safety until a cleanup crew arrives. Immediate containment by the discovering person can reduce the extent of the spill damage.

4.1 FIRST PRIORITIES

The first priorities after discovering a spill are to protect the safety of personnel and the public, minimize damage to the environment, and control costs associated with cleanup and reclamation. Actions to be taken immediately following a spill include the following:

1. Assess the safety of the situation (including the surrounding public).
2. Sources of ignition will be removed from the area, **if safe to do so**.
3. The source of the spill will be shut off, **if safe to do so**.
4. Efforts to contain the spill immediately will be initiated, **if safe to do so**.

Cleanup activities will be initiated as soon as possible after the spill is contained using properly trained and protected personnel with adequate spill cleanup materials and equipment.

5.0 SPILL REPORTING

All spills will be reported immediately to the Spill Coordinator who will in turn work with an EI and WBI Energy's Designated Representative to address and report the spill as necessary. The Spill Coordinator will record at a minimum the following information (found on the Spill Report Form in appendix A):

1. Date, time, and location of the spill.
2. Type of material spilled.
3. Amount of material spilled.
4. Extent of spill area.
5. Whether the material has reached or has the potential to reach a waterbody.
6. Status of spill containment and cleanup.
7. Circumstances leading up to the spill.

WBI Energy's Designated Representative will report the spill to the appropriate regulatory agencies if the spill meets or exceeds a reportable threshold. Appropriate agencies include, but may not be limited to, the following:

1. North Dakota Department of Health at 1-701-328-5210 for non-emergencies or North Dakota Department of Emergency Services at 1-800-472-2121 (24 hour hotline) for emergencies. The North Dakota Department of Health also requires completion of an online "General Environmental Incident" form available at http://www.ndhealth.gov/ehs/eir/eirform.htm for any spill of any volume.

2. National Spill Response Center (Washington D.C.) at 1-800-424-8802 (24 hours).

3. U.S. Army Corp of Engineers – Jeremy Thury (701-654-7761) and Reece Nelson (402-995-2505) for any spills occurring on U.S. Army Corp of Engineers owned land.

4. U.S. Forest Service Little Missouri National Grasslands– McKenzie Ranger District (701-842-8500) Cale Bickerdyke or Kim Grotte for any spills occurring on U.S Forest Service owned land.

Contractors are responsible for assisting WBI Energy with preparing follow-up written incident reports to regulatory agencies upon request and with accommodating any inspections performed by regulatory agencies.

WBI Energy's internal Spill Report Form will be completed by the Spill Coordinator and provided to WBI Energy's Designated Representative as soon as possible but no later than the end of the day on the day the spill event occurred so agencies can be notified in a timely manner and pertinent information is available for reporting. State and federal agencies must be notified within 24 hours of a reportable spill event. Field personnel will report the spill to the state and federal agencies only if the WBI Energy's Designated Representative is unavailable to do so. All Spill Report Forms and other reporting documentation will be kept on file by WBI Energy's Designated Representative.

6.0 SPILL CONTROL AND CLEANUP

Spill control should only be done by employees trained and prepared to effectively control the spill. Good judgment should be made by employees as to their personal role in the containment actions; however, prompt action can often prevent extensive spill damage. Employees engaged in spill control will use the proper precautions and safety equipment as specified in the Safety Data Sheet(s). The Designated Representative and EI will devise a cleanup plan, as necessary, based on location, quantity, and type of substance spilled.

Upon learning of the spill, the Spill Coordinator will implement the measures in the following sections.

6.1 LAND SPILL

- As necessary, berms will be constructed with available equipment to physically contain the spill and sorbent materials will be applied to the spill area. Traffic on contaminated soils will be minimized.

- Contaminated soils and vegetation will be removed and disposed of at a licensed waste disposal facility.

- Waste materials from the spill will be disposed of according to state and federal regulatory requirements.

- The following information will be provided to the EI and the WBI Energy Designated Representative:

    - The amount of spilled material that was recovered during cleanup.

- Proposed reclamation of remaining contaminated areas.
- Storage method for the contaminated waste material before transport and disposal.
- Transport and disposal documentation for the contaminated waste material.

6.2 WETLAND AND WATERBODY SPILL

Regardless of size, the following conditions apply if a spill occurs near or into a stream, wetland, or an open surface water source.

- For spills in standing water, floating booms, skimmer pumps, and holding tanks shall be used as appropriate by the contractor to recover and contain released materials on the surface of the water.
- For a spill threatening a waterbody, berms and/or trenches will be constructed to contain the spill before it reaches the waterbody. Deployment of booms, sorbent materials, and skimmers may be necessary if the spill reaches the water. The spilled product will be collected and the affected area cleaned up in accordance with appropriate state or federal regulations.
- Contaminated soils in wetlands must be excavated from the wetland. The soils must be placed on and covered by plastic sheeting in approved containment areas a minimum of 100 feet away from wetlands or waterbodies. Contaminated soil will be disposed of as soon as possible in accordance with appropriate state or federal regulations.

All cleanup activities will be conducted according to this SPCC Plan. Personnel involved in cleanup activities will meet the minimum requirements for hazardous materials training and will use approved Occupational Safety and Health Administration safety equipment.

WBI Energy's contractor responsible for the HDD has also developed an activity-specific SPCC plan for the HDD of Lake Sakakawea. In event of a spill or inadvertent release of drilling fluid during the HDD crossing of Lake Sakakawea, the SPCC plan included as Appendix B will be implemented.

I. Introduction

This Spill Prevention Control and Countermeasure Plans (SPCC) have been developed by Michels Corporation (Michels) to serve as a guideline for horizontal directional drilling (HDD) operations. This plan is intended to ensure that the equipment utilized to perform the work and the fuel, oil, and lubricant products used in the day to day operation of the equipment will have no long-term adverse environmental impact on the staging areas required for construction. The guidelines contained in this plan will be implemented by field personnel to prevent accidental releases of hazardous material to the environment and to outline measures taken should an accidental release occur. The drilling project manager for the project is experienced in these matters and is typically the designated Spill Coordinator for Michels.

This SPCC plan was developed using Federal Energy Regulatory Commission (FERC) guidelines for construction activities along a pipeline right-of-way. This plan is intended to comply with all applicable requirements of FERC and local State and County authorities. Since HDD operations are generally confined to two distinct locations, the rig (entry) side and pipe (exit) side, this SPCC plan addresses construction operations at these specific locations only for hazardous materials. This SPCC plan consists of three sections:

- Preventative measures to be taken prior to initiating construction with hazardous materials;
- Preventative procedures to be followed while using hazardous materials during construction;
- Procedures to be implemented should an accidental spill of hazardous material occur;

II. Pre-Construction Hazardous Material Spill Prevention

Prior to construction, all Michels' personnel who will be performing work on site will have attended a FERC-approved environmental training program within the last year. This training program will serve to indoctrinate the personnel and make them aware of the pollution control laws, rules, and regulations applicable to the pipeline right-of-ways. Michels' personnel are highly experienced with the equipment to be used in HDD operations and have worked on numerous FERC governed projects in the past. However all personnel will be refreshed by the project manager and drill superintendent in the operation and maintenance of construction equipment to prevent the accidental discharge or spill of fuel, oil, or lubricants.

Through the environmental training program and the project manager's guidance along with knowledge obtained from past experience, all Michels' personnel will be thoroughly educated on the following topics:

© Copyright, Michels Directional Crossings, a Division of Michels Corporation, 2020

- Precautionary measures to prevent spills;
- Potential sources of spills, such as equipment failure or malfunction and re-fueling procedures;
- Standard operating procedures in case of a spill, including applicable notification requirements;
- Equipment, Materials, and Supplies available for clean-up of a spill;
- Review of known spill events, if any.

Prior to mobilizing equipment to the proposed alignment R.O.W., Michels will thoroughly inspect and if necessary repair or replace equipment components that could potentially leak hazardous material. The equipment will be cleaned of any debris or material observed to be hazardous. All hazardous material storage containers and secondary containment devices will be inspected and if necessary repaired or replaced.

The spill containment and clean-up materials used by Michels will be inventoried and if necessary re-stocked prior to initiating construction operations. At a minimum, the following spill containment and clean-up materials will be located in a central location at each side of the HDD crossings where equipment is in use or hazardous materials are stored in sufficient quantities to contain and clean-up a spill or release should one occur:

- Spill containment kits typically consisting of the following items
  - 1 x 55 gal poly drum
  - 50 x 18” x 18” absorbent pads
  - 8 x 3” x 4’ absorbent socks
  - 6 x 18” x 18” absorbent pillows
  - 3 x 5” x 10’ absorbent booms
  - 4 Disposable plastic bags with ties
  - 4 pair nitrile gloves
- Plastic sheeting
- Floor Dry absorbent material (50 pound bag-typical)
- Personal protective equipment (i.e. gloves and safety glasses)
- Replacement parts and equipment for repair of tanks, hoses, nozzles, etc.
- Equipment and tools to divert spilled fluids and create earthen barriers

III. HDD Construction Operations Hazardous Material Spill Prevention

Once construction activities for the HDD are underway, hazardous material spill prevention will be a continuous element of the operations. During equipment set up, potential sources of hazardous material releases, i.e. fuel tanks, hydraulic oil tanks and hoses, antifreeze tanks, and lubricant storage bins will be located as far away as practicably possible from streams, wetlands, and drainage ways. If necessary, and if practicable, temporary barriers may be constructed or placed between the potential sources of spills and areas identified as extremely sensitive to accidental

© Copyright, Michels Directional Crossings, a Division of Michels Corporation, 2020

spills. Spill containment and clean-up materials/kits will be located in a central location at each side of the drill site location where equipment is in operation or hazardous materials are stored and all personnel will be made aware of the location.

Secondary containment devices will be placed to enclose major sources of potential hazardous spill locations (i.e. fuel storage tanks and hazardous materials storage areas). A site layout drawing for entry locations and exit locations showing the placement of significant sources of hazardous material releases and secondary containment measures are attached in **Appendix A** of this plan. The exact location of the equipment will vary to address specific site conditions after the temporary work space has been prepared for equipment set-up. Access to the sites will be limited by the Project Manager to only authorized personnel and visitors.

During construction, spill refresher briefings will be scheduled quarterly and conducted by Michels. The briefings will refresh Michels' personnel on the topics covered during the pre-construction environmental training as well as review operations to date, including any accidental spills that may have occurred and measures taken for prevention of future spills.

Michels will store, handle and transfer hazardous materials used during HDD operations in a manner to prevent accidental releases or spills of these materials. **Table-1** attached in **Appendix-A** to this plan summarizes the hazardous materials, combined expected volumes, and storage methods for both the entry and exit locations. The Material Safety Data Sheets (MSDS) for every product used by Michels are maintained on file in the drilling survey trailer on site should they be required to assess the hazard potential of a spill. The list of primary hazardous materials (petroleum-based products) to be used by Michels over the course of each HDD crossing is as follows:

- Gasoline
- Diesel Fuel
- Hydraulic Oil
- Lubricants
- Penetrating Oils
- Antifreeze

Michels' personnel will follow specific guidelines set forth in this plan during operation and maintenance of equipment and vehicles used in support of the HDD operations. All waste oil or fuel collected during routine maintenance of the equipment will be contained and disposed of in accordance with state and federal requirements.

IV. Potential Sources of Hazardous Spill-Preventative Measures to be Implemented

For day to day operations, Michels' personnel will follow these guidelines to prevent the accidental release or spill of hazardous materials:

Potential Source of Hazardous Spill	Preventative Measures To be Implemented
Fuel stored in a storage tank	• Except as specified in **Attachment-A** of Appendix-B, locate storage tank at least 100 feet from wetlands or surface waters, at least 200 feet from private water supplies, and at least 400 feet from public water supplies. • Install secondary containment devices around tank in excess of 150% of the maximum volume to be stored. • Inspect tank and secondary containment daily and before filling, implement corrective action upon discovery of deterioration that could cause a spill or result in a leak. Record inspection results weekly on log attached in the appendix to this plan. • Remove any precipitation found within the secondary containment. Prior to removing the precipitation, inspect for film, sheen, discoloration, sludge, emulsion or tarry residue, if present then collect the liquid for disposal. Do not discharge to land or surface waters. • Plug or close all tank openings when not in use. • Maintain sufficient quantities of spill control and clean-up materials in a central location near the storage tank, inspect supply daily. • Provide security measures to protect against vandalism of stored materials
Liquid material stored in a container	• Except as specified in **Attachment-A** of Appendix-B, store container at least 100 feet from wetlands or surface waters, at least 200 feet from private water supplies, and at least 400 feet from public water supplies. • If practicable and if room allows, store containers in a central location within a common secondary containment device. All significant container storage (i.e. greater than 5 gallon) will have secondary containment in excess of 150% of the maximum volume proposed to be stored. • Use small containers which are in good condition (maximum 55 gallon drum). • Take measures to protect the containers from the elements or physical damage. • Inspect containers daily, replace immediately if damaged or leaking. Record inspection results weekly on log attached in **Attachment-B** of Appendix-B to this plan • Close containers when not in use. • Maintain sufficient quantities of spill control and clean-up materials in a central location where the containers are regularly used, inspect supply daily. • Provide security measures to protect against vandalism of stored materials

© Copyright, Michels Directional Crossings, a Division of Michels Corporation, 2020

Liquid material transferred from a storage tank or container to vehicles or equipment	• Except as specified in **Attachment-A** of Appendix-B**,** transfer materials at least 100 feet from wetlands or surface waters, at least 200 feet from private water supplies, and at least 400 feet from public water supplies. Exercise extreme caution for transfers in areas where set-back distances from sensitive areas cannot be met such as placement of absorbent pads or drip pans beneath transfer points, creating temporary earthen berms, or other similar precautionary spill measures. • Transfer during daylight hours or where lighting is adequate to illuminate the area. • Monitor transfer operations at all times. • Maintain sufficient quantities of spill control and clean-up materials in a central location where transfers regularly occur, inspect supply daily. • Provide security measures to protect against vandalism of stored materials

© Copyright, Michels Directional Crossings, a Division of Michels Corporation, 2020

Liquid material used in vehicles and equipment	• Except as specified in **Attachment-A** of Appendix-B, park at least 100 feet from wetlands or surface waters, at least 200 feet from private water supplies, and at least 400 feet from public water supplies. • Inspect daily for leaks or signs of deterioration that could result in a leak. • Repair or replace defective tanks, hoses, fittings, etc. • Maintain sufficient quantities of spill control and clean-up materials in a central location where equipment or vehicles are in use, inspect supply daily. • Provide security measures to protect against vandalism of stored materials

© Copyright, Michels Directional Crossings, a Division of Michels Corporation, 2020

Liquid material transferred from tank vehicle to vehicles & equipment	• Except as specified in **Attachment A** of Appendix-B, tank vehicle used during re-fueling operations shall be specifically designed for supplying fuel to vehicle or equipment tanks and will comply with the requirements of NFPA 385 and other applicable state and federal requirements. • Tank vehicle and its equipment shall be maintained in good repair. • Drivers to be thoroughly trained in the proper method and operation of tank vehicles and in acceptable unloading procedures. • The driver or operator will not leave vehicle unattended during re-fueling operations • All engines to be shut off and operators not on the equipment during refueling operations. • Smoking is to be forbidden on or near any vehicle involved in re-fueling operations. Extreme precaution shall be exercised to prevent people in the vicinity from smoking, lighting matches, or carrying any flame or lighted device. Signs prohibiting smoking or open flames to be prominently displayed in open view on the tank vehicle. • Re-fueling procedures will not be initiated until precautions have been taken to prevent the motion of vehicles involved. Parking brakes to be utilized if available. • Length of refueling hose is typically limited to 50-feet from the hose reel. Tank vehicle to be positioned with respect to vehicles being fueled in order to prevent unwanted traffic between the tank vehicle and vehicle/equipment being fueled. • Each vehicle must contain one portable fire extinguisher that has a minimum rating of 4A, or 4-B,C. Ratings to be in accordance with NFPA-10. Signage on vehicles shall clearly indicate location of fire extinguisher. • Fueling/Re-fueling operations should typically take place during daylight hours. Nighttime fueling operations conducted in adequately lighted areas. • Documentation of training to be made available upon request. • Provide security measures to protect against vandalism of stored materials

Should these guidelines prove to be inadequate to prevent the accidental release or spill of hazardous material, they will be revised and implemented as required to ensure that every possible preventative effort is being taken. All personnel will be made aware of any such revisions at the time of the revision and at the environmental refresher meetings.

V. HDD Construction Operations Hazardous Material Spill Procedures

A spill is an unintentional release of hazardous material to the environment. In the unlikely event that an inadvertent spill of a hazardous material occurs the following steps will be followed at a minimum:

- Step 1 - Containment: Assess the situation prior to attempting to control the spill. Secure the spill scene and attempt to identify and stop the source of spill and

© Copyright, Michels Directional Crossings, a Division of Michels Corporation, 2020

contain at source. Limit access to the site in order to prevent/limit personal and/or property damage. Responders must have knowledge of the spilled material and immediately utilize all available resources (i.e. equipment, personnel, and materials), to contain spill. If adequate resources are not available, expedite mobilization of additional resources from other construction activities as required to fully contain the spill. If the spill cannot be adequately handled by additional resources, Michels will arrange for an approved spill response contractor to mobilize to the site and contain, clean up, and perform required sampling and disposal of spilled materials and residual contaminated debris.

- Step 2 - Remediation: Properly trained personnel shall clean up hazardous material immediately after spill is contained to prevent further migration of hazardous materials into the environment. Responders should consult with proper governmental resource agencies as required. In no case shall containment equipment be used to permanently store contaminated material. Containerize in DOT-approved containers, label, and remove all contaminated material from the construction area and dispose of material in accordance with applicable regulatory guidelines (i.e. transport to hazardous waste disposal facility by licensed waste hauler). The Owner will be provided with proper documentation showing that material was disposed of in a proper manner.

- Step 3 - Notification: Reporting requirements will depend on the quantity of spill. A spill constituting less than a significant spill event will be reported to Owner and/or Owner's representative Chief Inspector **(CI)-_____: ( ) - (office), or ( ) - (cell).**

  Significant spills are defined as: any amount of petroleum, oils, or lubricants discharged to a receiving stream that causes a film, sheen, or discoloration of surface water or adjoining shoreline; or any reportable quantity of hazardous material as defined by 40CFR320. If a significant spill should take place, Michels' Project Manager (PM), will notify the Prime Contractors' Project Manager and Owner's representative Chief Inspector **(CI)-_____( ) - (office), or ( ) - (cell)** of the spill as soon as he has confirmed that the spill has been completely contained. Michels' PM will assist the Owner's representative in submitting the regulatory-required information for hazardous spill notification in accordance with Governing Agency procedures. At the very minimum the project superintendent will provide the CI with the information required on the "Spill Report" included as **Attachment C** in Appendix C.

- Step 4 – Michels' Project Manager will be responsible for any applicable agency reporting requirements. The notification requirements for petroleum and hazardous materials spills are as follows:

  - Federal Contacts:
    National Spill Response Center 1-800-424-8802

© Copyright, Michels Directional Crossings, a Division of Michels Corporation, 2020

- State Contacts:
  State Department of Environmental
  Quality - Spill Notification ( ) - (Business Hours)
  ( ) - (After Hours)

- Local Contacts:
  Local Fire Department _____

- A completed Petroleum and Hazardous Materials Spill Report must be submitted to OWNER & Governmental Agencies within 48 hours.
- Prior to continuing work, Michels will determine the cause of the spill and implement measures to ensure that further spills will not occur.

A More detailed list of Local Emergency Response Personnel and Hospital Location will be attached and filled out as **Attachment D** in Appendix C.

APPENDIX-A

TABLE I

HAZARDOUS SUBSTANCE INVENTORY

Material	Quantity (gallons)	Storage Location	Reportable Quantity (include reference)
Oil/Fuel:			
Unleaded Gasoline	**10 Gallons**	**5 Gallon DOT-Approved Re-fill able Cans - Storage Trailer**	
	80 Gallons	**Fuel Tank in Bed of Pick-Up Truck**	
Diesel Fuel	**120 Gallons**	**Fuel Tank in Bed of Pick-Up Truck**	
	500 Gallons	**Fuel Tank w/Secondary Containment on Site in excess of 150% of maximum volume**	
Motor Oil	**1 or 5 Gallons**	**Reinforced Plastic Container - Storage Trailer**	
Hydraulic Oil	**110-Gallons**	**Two 55-gallon drums w/Secondary Containment on Site in excess of 150% of maximum volume**	
Commercial Chemicals:			
Ethylene Glycol	**40-Gallons**	**1 or 5 Gallon Reinforced Plastic Containers - Storage Trailer**	
Hazardous Wastes:			

APPENDIX-B

Attachment A

The setbacks specified for refueling, fuel storage, and parking of equipment may not be practicable for certain construction activities, including horizontal directional drilling. Exceptions to the setback requirements may be allowed for:

- Areas where removing equipment from a wetland for servicing or overnight parking would increase adverse impacts to the wetland and/or result in significant construction delays;
- Construction sites where moving equipment to refueling stations from pre-fabricated equipment pads is impracticable or where there is a natural barrier from the water-body or wetland (i.e., dike, road or railroad);
- Locations where the water-body or wetland is located adjacent to a road crossing (from which the equipment can be serviced);
- Refueling and fuel storage for immobile equipment including, but not limited to, bending and boring machines, air compressors, padding machines, and hydro-test fill pumps.

ATTACHMENT B
WEEKLY HAZARDOUS MATERIALS/WASTE INSPECTION LOG

For each item listed below, Contractor will indicate whether existing conditions are acceptable (A) or unacceptable (U). Resolution of all unacceptable conditions must be documented. Contractor will inspect all storage facilities on a regular basis, but not less than weekly. Contractor will keep records of all inspections on file. Contractor will provide a coy of the completed form to the Chief Inspector and Environmental Inspector on a weekly basis.

I. STORAGE AREAS FOR FUELS, LUBRICANTS AND CHEMICALS

General

A/U

_____ Construction yard or storage areas secured

_____ National Fire Protection Association symbol posted in storage area or at yard entrance

_____ Storage areas properly prepared and signed

_____ Material Safety Data Sheets available

_____ Hazardous Materials Management Plan/Spill Prevention and Countermeasure Plan available

Hazardous Materials Management

A/U

_____ No evidence of spilled or leaking materials

_____ Incompatible materials separated

_____ All containers labeled properly

_____ All containers securely closed

_____ All containers upright

_____ No evidence of container bulging, damage, rust or corrosion

Secondary Containment Areas

A/U

_____ Containment berm intact and capable of holding 110% of material stored plus precipitation

_____ Lining intact

_____ No materials overhanging berms

_____ No materials stored on berms

_____ No flammable materials used for berms

Compressed Gases

A/U

_____ Cylinders labeled with contents

_____ Cylinders secured from falling

_____ Oxygen stored at least 25 feet away from fuel

_____ Cylinders in bulk storage are separated from incompatible materials by fire barriers or by appropriate distance

II. HAZARDOUS WASTE MANAGEMENT

Waste Container Storage

A/U

_____ No evidence of spilled or leaking wastes

_____ Adequate secondary containment for all wastes

_____ Separate containers for each waste stream—no piles

_____ Waste area not adjacent to combustibles or compressed gases

_____ All containers securely closed

_____ Bungs secured tightly

_____ Open-top drum hoops secured

_____ All containers upright

_____ No evidence of container bulging, corrosion

_____ No severe container damage or rust

_____ Containers are compatible with waste (e.g. plastic liner for corrosives, metal liner for solvents)

_____ No smoking and general danger/warning signs posted

Waste Container Labeling

A/U

_____ Containers properly labeled

_____ Name, address and EPA ID number or ID Number of generator listed (Not required if Contractor is an exempt small quantity generator.)

_____ Accumulation start date listed

_____ Storage start date listed

_____ Chemical and physical composition of waste listed

_____ Hazardous property listed

Nonhazardous Waste Areas

A/U

_____ No litter in yard

_____ No hazardous wastes or used oil mixed with trash (e.g., contaminated soil, oily rags, diapers, or other oily materials)

_____ Empty oil and aerosol containers for disposal are completely emptied

III. EMERGENCY RESPONSE EQUIPMENT

A/U

_____ Shovels

_____ Absorbent materials (booms, pads, pillows, socks, “Speedy Dry”

_____ Personal protective equipment (goggles, gloves)

_____ Fire-fighting equipment

_____ First aid supplies (e.g. medical supplies, squeeze bottle eye wash)

_____ DOT-approved containers

_____ Plastic sheeting, bags and ties

_____ Communication equipment

_____ Bung wrench (non-sparking)

(Required for all unacceptable conditions)

IV. CORRECTIVE ACTIONS TAKEN

_____

_____

_____

_____

_____

APPENDIX-C

ATTACHMENT C

Petroleum and Hazardous Material Spill Report

Date of spill: _____ Incident No: _____ Date of spill discovery: _____

Time of spill: _____ Time of spill recovery: _____

Location Name: _____ Spread: _____ County: _____

Section: _____ Township: _____ Range: _____

Name and Title of Discoverer: _____

Type of material spilled and product name: _____

Manufacturer's Name: _____

Legal description of spill location: _____

Directions from nearest community: _____

_____

_____

Estimated volume of spill: _____ Estimated material recovered: _____

Weather Conditions: _____

Topography and surface conditions of spill site: _____

Spill medium (pavement, sandy soil, water, etc.): _____

Proximity of spill to surface waters or wetland: _____

Did the spill reach a water body? _____ Yes _____ No

If so, was a sheen present? _____ Yes _____ No

Direction and time of travel (if in stream): _____

Responsible party (name, phone number): _____

Describe the causes and circumstances resulting in the spill: _____

_____

_____

Describe the extent of observed contamination, both horizontal and vertical (i.e., spill-stained soil in a 5'' radius to a depth of 1"):

_____

_____

Resources and installations that may be affected: _____

_____

_____

Potential impact on human health: _____

Describe immediate spill control and/or cleanup methods used and implementation schedule: _____

Current status of cleanup actions: _____

Name/Company/Address/Phone Number for the following:

Construction Superintendent: _____

OWNER
Representative: _____

Environmental Director: _____

Person Who Reported the Spill: _____

Environmental Inspector: _____

On-Scene Agency Coordinator (where applicable): _____

Form completed by: _____ Date: _____

The Contractor must complete this for any petroleum or hazardous material spill regardless of size, and submit the form to OWNER or OWNER's designated representative for construction observation within 48 hours of the occurrence.

ATTACHMENT D
LOCAL Emergency RESPONSE PERSONNEL-HOSPITAL LOCATION

The contractor should provide a listing by municipality of the local emergency response organizations near the HDD project site, and the name and phone number of a contact person for each. For example, list fire and police departments, emergency management organizations, etc. The contractor should update and complete this information as required for his/her work locations. Additions will be made by the Project Manager once they become available prior to drilling operations.

WBI ENERGY TRANSMISSION, INC.
North Bakken Expansion Project
Section 408 Application

Attachment 5
Emergency Response Plan, Facility Response Plan, and Geographical Response Plan

August 2020

WBI ENERGY TRANSMISSION, INC.
NORTH BAKKEN EXPANSION PROJECT
EMERGENCY RESPONSE PLAN, FACILITY RESPONSE PLAN, AND GEOGRAPHICAL RESPONSE PLAN

1.0 PROJECT DESCRIPTION

WBI Energy Transmission, Inc. (WBI Energy) proposes to construct and operate the North Bakken Expansion Project (or Project), which consists of an approximately 61.9-mile-long, new 24-inch-diameter natural gas pipeline from new facilities at WBI Energy's Tioga Compressor Station near Tioga, North Dakota, to a new compressor station (Elkhorn Creek Compressor Station) southeast of Watford City, North Dakota.

The Project also involves construction of approximately 0.3 mile of new 24-inch-diameter natural gas pipeline between the proposed Elkhorn Creek Compressor Station to a new interconnect with Northern Border Pipeline Company, approximately 20.4 miles of new 12-inch-diameter natural gas pipeline looping along WBI Energy's Line Section 25, approximately 9.4 miles of new 12-inch-diameter natural gas pipeline looping along WBI Energy's Line Section 30, approximately 0.5 mile of new 20-inch-diameter receipt lateral to the Tioga Compressor Station, and uprating of WBI Energy's Line Section 25. The Project includes additional horsepower at the Tioga Compressor Station; the installation of new and modifications to existing delivery, receipt and transfer stations along WBI Energy's pipeline routes; the replacement of small segments of pipeline facilities; and the installation of block valves, pig launcher/receiver stations and other associated appurtenances.

2.0 EMERGENCY REPONSE PLAN

WBI Energy will manage potential sources of gas releases by implementing WBI Energy's Gas System Operations and Maintenance Manual and Control Room Management Manual (CUI/PRIV – DO NOT RELEASE). These are Pipeline Hazardous Materials Safety Administration (PHMSA) approved manuals for the entire WBI Energy system. Copies of these manuals are provided as Appendix A and B in Attachment 6 of the Section 408 application. Once the Project becomes operational, these manuals will be updated to include the required notification procedures and points of contact for the U.S. Army Corps of Engineers.

3.0 FACILITY RESPONSE PLAN

As noted in section 2.0, WBI Energy prepares Operation and Maintenance Plans that include emergency response procedures according to and approved by the U.S. Department of Transportation, Pipeline and Hazardous Materials Safety Administration. In addition, Per 40 CFR 112.20, the EPA Facility Response Planning Compliance Assistance Guide, the North Bakken Expansion Project is not an oil pipeline and does not trigger the need for a Facility Response Plan. Furthermore, the portion of the Project that will be installed below U.S. Army Corps of Engineers owned property and below Lake Sakakawea is a natural gas pipeline, and will not require storage or transport of oil.

4.0 GEOGRAPHICAL RESPONSE PLAN

Most natural gas used in the United States is delivered to consumers through approximately 319,400 miles of gathering and transmission pipelines, providing about 25 percent of the total energy consumption in the United States. Because of the critical role transmission

pipelines play in supplying a large portion of the country's energy needs, it is imperative that they are safe and reliable. Pipelines and related facilities are designed and maintained with strict adherence to Pipeline and Hazardous Materials Safety Administration regulations, which are intended to provide public safety and reliability and minimize the risk of system failure.

The natural gas transmission industry has an excellent record of public safety and reliability. Nevertheless, the transportation of natural gas by pipeline involves some risk to the public in the event of an accidental release of natural gas. The Project will transport natural gas that contains primarily methane, but also smaller amounts of ethane, propane, and higher hydrocarbon gases such as butane. This product is a colorless, practically odorless gas. If natural gas is breathed in high concentrations, oxygen deficiency can occur, resulting in serious injury or suffocation. Natural gas has an auto-ignition temperature of approximately 1,000 degrees Fahrenheit and is flammable at methane concentrations between 5 and 15 percent in air. These concentrations can be reached when natural gas is in a confined space, and could result in a hazard in the presence of an ignition source. Unconfined mixtures of natural gas and air become highly diluted and are not usually explosive. Lighter components of natural gas such as methane are buoyant at atmospheric temperatures and, if released, rise and disperse rapidly in air. Higher hydrocarbon components of natural gas such as propane are heavier than air and, although unlikely, may form a potentially flammable cloud near the ground until sufficiently dispersed in air.

The Pipeline and Hazardous Materials Safety Administration administers the national regulatory program to provide for the safe transportation of natural gas and other hazardous materials by pipeline. Safety regulations and other approaches to risk management provide for safety in the design, construction, testing, operation, and maintenance of pipeline facilities. These standards are specified in Title 49 of the Code of Federal Regulations (CFR) Part 192 (49 CFR 192).

WBI Energy is committed to protecting the safety of those living or working near its pipeline system and working proactively to keep its system operating safely and effectively. Accordingly, the Project will be designed, constructed, tested, operated, inspected, and maintained to meet or exceed the DOT's Minimum Federal Safety Standards specified in 49 CFR 192. These regulations are intended to ensure adequate protection of the public from natural gas pipeline facility accidents and failures; in addition, 49 CFR 192 specifies the minimum material, design, welding, construction, testing, protection from corrosion, operations, maintenance, and personnel qualifications for pipelines. Further, Subpart O requires each pipeline operator to have a detailed integrity management program. As a part of the integrity management program, high-resolution in-line inspection tools (i.e., smart pigs), pressure tests, or direct assessments are periodically performed on the line to assess the pipe for any features requiring remediation (e.g., corrosion, dents, gouges).

As the Project is not an oil pipeline, WBI Energy is not required to develop a Facility Response Plan per 49 CFR 194.101 and 194.103.3. As noted in section 2.0 above, WBI Energy will implement the company-wide Gas System Operations and Maintenance Manual and the Control Room Management Manual (CUI/PRIV – DO NOT RELEASE), which are PHMSA approved documents. Appropriate points of contact and procedures for notifications to the U.S. Army Corps of Engineers will be included in these manuals once the Project becomes operational. Copies of these manuals are included with Attachment 6 of the Section 408 application.

Attachment 6

Operation and Maintenance Plan

(CUI/PRIV - DO NOT RELEASE - WBI Energy's Gas System Operation and Maintenance Manual and Control Room Management Manual**)**

Attachment 7

Reclamation and Monitoring Plan

WBI ENERGY TRANSMISSION, INC.
North Bakken Expansion Project
Section 408 Application

Attachment 7
Reclamation and Monitoring Plan

August 2020

WBI ENERGY TRANSMISSION, INC.
NORTH BAKKEN EXPANSION PROJECT
RECLAMATION AND MONITORING PLAN

WBI Energy Transmission, Inc. (WBI Energy) proposes to construct and operate the North Bakken Expansion Project (or Project), which consists of an approximately 61.9-mile-long, new 24-inch-diameter natural gas pipeline from new facilities at WBI Energy's Tioga Compressor Station near Tioga, North Dakota, to a new compressor station (Elkhorn Creek Compressor Station) southeast of Watford City, North Dakota.

The Project also involves construction of approximately 0.3 mile of new 24-inch-diameter natural gas pipeline between the proposed Elkhorn Creek Compressor Station to a new interconnect with Northern Border Pipeline Company, approximately 20.4 miles of new 12-inch-diameter natural gas pipeline looping along WBI Energy's Line Section 25, approximately 9.4 miles of new 12-inch-diameter natural gas pipeline looping along WBI Energy's Line Section 30, approximately 0.5 mile of new 20-inch-diameter receipt lateral to the Tioga Compressor Station, and uprating of WBI Energy's Line Section 25. The Project includes additional horsepower at the Tioga Compressor Station; the installation of new and modifications to existing delivery, receipt and transfer stations along WBI Energy's pipeline routes; the replacement of small segments of pipeline facilities; and the installation of block valves, pig launcher/receiver stations and other associated appurtenances.

The Project will require crossing of the Lake Sakakawea Reservoir, which is managed by the U.S. Army Corps of Engineers (USACE), along with USACE-owned lands adjacent to Lake Sakakawea. WBI Energy proposes to install the natural gas pipeline under Lake Sakakawea and USACE lands using the horizontal directional drill (HDD) construction method, a trenchless method designed to avoid direct impacts to sensitive features. The HDD workspaces will be located adjacent to USACE-owned lands on the north side of the lake, and approximately 800 feet from USACE-owned lands on the south side of Lake Sakakawea. No surface impact to USACE lands is anticipated for this Project during installation and operation of the pipeline; all temporary surface impacts will be located outside of USACE lands. Access in the area of the proposed HDD will be along public and private roads.

WBI Energy has acquired Michels Corporation (Michels) to perform the horizontal direction drilling operations for installation of the pipeline beneath Lake Sakakawea. Two drilling rigs will be used (both on private land), located on either side of Lake Sakakawea. The drilling rigs will be installed on matting and minimal surface disturbance outside of the proposed drill box locations is anticipated to occur.

No excavation will occur on USACE lands and no tracked equipment is anticipated to be used on USACE lands. Based on the technical analysis completed to date, WBI Energy does not anticipate an inadvertent return of drilling fluid into Lake Sakakawea. In the unlikely event of an inadvertent return of drilling fluid within Lake Sakakawea, WBI Energy would implement emergency procedures outlined in Michels' Horizontal Direction Drilling Installation Plan filed as Attachment 1 of the Section 408 Application. Notifications would be made to the appropriate federal and state contacts within one hour of identification. Specialized crews would mobilize utilizing agreed upon routes from the Project workspace if the return is located on USACE owned property and deploy turbidity curtains (as appropriate) to contain the release to the smallest impact.

WBI Energy is requesting that the post-construction monitoring requirement be waived on USACE lands, assuming no inadvertent return occurs on USACE property. No surface improvements (e.g., fencing, recreation facilities) will be impacted by the proposed Project. No land disturbance occurring on USACE land is anticipated to occur, however in the unlikely event of an inadvertent return, any land disturbance occurring on USACE land will be restored and revegetated according to the FERC Plan and Procedures and additional requests beyond those outlined in the Plan and Procedures would be address in coordination with the USACE Garrison Project Office.

On lands impacted by typical pipeline construction (outside of the HDD path) WBI Energy will restore Project work areas to pre-construction conditions as required in the Federal Energy Regulatory Commission's (FERC) *Upland Erosion Control, Revegetation, and Maintenance Plan* (Plan) and *Wetland and Waterbody Construction and Mitigation Procedures* (Procedures), which have been provided for reference as attachments to the Erosion and Sediment Control Plan included for the Project.

Section 408 Application

Attachment 8
Risk Assessment Plan

August 2020

WBI ENERGY TRANSMISSION, INC.
NORTH BAKKEN EXPANSION PROJECT
RISK ASSESSMENT PLAN

1.0 PROJECT DESCRIPTION

WBI Energy Transmission, Inc. (WBI Energy) proposes to construct and operate the North Bakken Expansion Project (or Project), which consists of an approximately 61.9-mile-long, new 24-inch-diameter natural gas pipeline from new facilities at WBI Energy's Tioga Compressor Station near Tioga, North Dakota, to a new compressor station (Elkhorn Creek Compressor Station) southeast of Watford City, North Dakota.

The Project also involves construction of approximately 0.3 mile of new 24-inch-diameter natural gas pipeline between the proposed Elkhorn Creek Compressor Station to a new interconnect with Northern Border Pipeline Company, approximately 20.4 miles of new 12-inch-diameter natural gas pipeline looping along WBI Energy's Line Section 25, approximately 9.4 miles of new 12-inch-diameter natural gas pipeline looping along WBI Energy's Line Section 30, approximately 0.5 mile of new 20-inch-diameter receipt lateral to the Tioga Compressor Station, and uprating of WBI Energy's Line Section 25. The Project includes additional horsepower at the Tioga Compressor Station; the installation of new and modifications to existing delivery, receipt and transfer stations along WBI Energy's pipeline routes; the replacement of small segments of pipeline facilities; and the installation of block valves, pig launcher/receiver stations and other associated appurtenances.

The Project will require crossing of the Lake Sakakawea Reservoir, which is managed by the U.S. Army Corps of Engineers (USACE), along with USACE-owned lands adjacent to Lake Sakakawea. WBI Energy proposes to install the natural gas pipeline under Lake Sakakawea and USACE lands using the horizontal directional drill (HDD) construction method, a trenchless method designed to avoid direct impacts to sensitive features. The HDD workspaces will be located adjacent to USACE-owned lands on the north side of the lake, and approximately 800 feet from USACE-owned lands on the south side of Lake Sakakawea. No surface impact to USACE lands is anticipated for this Project during installation and operation of the pipeline; all temporary surface impacts will be located outside of USACE lands. Access in the area of the proposed HDD will be along public and private roads.

2.0 RISK ASSESSMENT OVERVIEW

WBI Energy and their contractors have prepared a HDD Design Report that addresses the engineering design for the HDD of Lake Sakakawea and evaluates the factor of safety for the HDD. The HDD Design Report is attached as Appendix A. The sections below provide additional information on the regulatory safety framework for natural gas pipelines and WBI Energy's operating and emergency response measures

2.1 NATURAL GAS TRANSMISSION PIPELINE SAFETY STANDARDS

Most natural gas used in the United States is delivered to consumers through approximately 319,400 miles of gathering and transmission pipelines, providing about 25 percent of the total energy consumption in the United States (U.S. Department of Transportation [DOT], Pipeline and Hazardous Materials Safety Administration [PHMSA], 2019a,b). Because of the critical role transmission pipelines play in supplying a large portion of the country's energy needs,

it is imperative that they are safe and reliable. Pipelines and related facilities are designed and maintained with strict adherence to PHMSA regulations, which are intended to provide public safety and reliability and minimize the risk of system failure.

The natural gas transmission industry has an excellent record of public safety and reliability. Nevertheless, the transportation of natural gas by pipeline involves some risk to the public in the event of an accidental release of natural gas. The Project will transport natural gas that contains primarily methane, but also smaller amounts of ethane, propane, and higher hydrocarbon gases such as butane. This product is a colorless, practically odorless gas. Project facilities will be odorized as appropriate per Title 49 of the CFR Part 192 (49 CFR 192) part 625. If natural gas is breathed in high concentrations, oxygen deficiency can occur, resulting in serious injury or suffocation. Natural gas has an auto-ignition temperature of approximately 1,000 degrees Fahrenheit and is flammable at methane concentrations between 5 and 15 percent in air. These concentrations can be reached when natural gas is in a confined space, and could result in a hazard in the presence of an ignition source. Unconfined mixtures of natural gas and air become highly diluted and are not usually explosive. Lighter components of natural gas such as methane are buoyant at atmospheric temperatures and, if released, rise and disperse rapidly in air. Higher hydrocarbon components of natural gas such as propane are heavier than air and, although unlikely, may form a potentially flammable cloud near the ground until sufficiently dispersed in air.

The PHMSA administers the national regulatory program to provide for the safe transportation of natural gas and other hazardous materials by pipeline. Safety regulations and other approaches to risk management provide for safety in the design, construction, testing, operation, and maintenance of pipeline facilities. These standards are specified in 49 CFR 192.

2.1.1 Pipeline Design, Construction, and Operating Standards

WBI Energy is committed to protecting the safety of those living or working near its pipeline system and working proactively to keep its system operating safely and effectively. Accordingly, the Project will be designed, constructed, tested, operated, inspected, and maintained to meet or exceed the DOT's Minimum Federal Safety Standards specified in 49 CFR 192. These regulations are intended to ensure adequate protection of the public from natural gas pipeline facility accidents and failures; in addition, 49 CFR 192 specifies the minimum material, design, welding, construction, testing, protection from corrosion, operations, maintenance, and personnel qualifications for pipelines. Further, Subpart O requires each pipeline operator to have a detailed integrity management program (IMP). As a part of the IMP, high-resolution in-line inspection tools (i.e., smart pigs), pressure tests, or direct assessments are periodically performed on the line to assess the pipe for any features requiring remediation (e.g., corrosion, dents, gouges).

DOT regulations in 49 CFR 192 define area classifications (called class location units) based on population density in the vicinity of a pipeline, and specify more rigorous safety requirements for populated areas. Each class location unit covers the area extending 220 yards on either side of the centerline of any continuous 1-mile length of pipeline. The proposed Project will fall under a Class 1 designation for its entire length, which is specified by any class location unit that has 10 or fewer buildings intended for human occupancy.

WBI Energy will monitor population changes in the vicinity of the pipeline over the life of the pipeline system. If an increase in population density adjacent to the right-of-way is detected,

WBI Energy will evaluate whether a change in class location is required and respond accordingly while meeting requirements of 49 CFR 192.

DOT regulations (49 CFR 192, Subpart O) additionally specify how pipeline operators must identify, prioritize, assess, evaluate, repair, and validate the integrity of natural gas transmission pipelines that could affect High Consequence Areas (HCAs) in the event of a leak or failure. The regulations require pipeline operators to develop and follow a written IMP that contains all the elements described in 49 CFR 192.911 and addresses the risks on each covered segment of the transmission pipeline. The criteria for an HCA in regards to a natural gas pipeline is the area within the potential impact circle containing 20 or more buildings intended for human occupancy, or any area within a potential impact circle that contains an identified site.[1]

No HCAs have been identified along the proposed Project route. However, the Project will be incorporated into WBI Energy's existing IMP and use the following criteria to determine HCA locations if conditions change along the pipeline system:

- identification of a site with 20 or more buildings intended for human occupancy; or
- location of an identified site.

On October 1, 2019, PHMSA issued a final rule amending the Federal Pipeline Safety Regulations in 49 CFR 191 and 192 to address integrity management requirements and improve the safety of onshore gas transmission lines (84 Federal Register 52180). The amendments, which will become effective July 1, 2020, focus on reconfirmation of MAOP for existing pipelines and the expansion of assessment requirements for pipelines in areas not designated as HCAs. The criteria for a moderate consequence area (MCA) as defined in the new amendments is an area that is within the potential impact circle of the pipeline that contains five or more buildings intended for human occupancy, or any portion of the paved surface including shoulders of a designated interstate, freeway, expressway, or any other principal arterial roadway with four or more lanes that lies within the potential impact circle. WBI Energy has identified one MCA that will exist where the new Tioga-Elkhorn Creek pipeline will cross 64th Street NW/Highway 2. WBI Energy will install additional launching and receiving facilities on both sides of this MCA that will allow for assessing the area.

2.2 OPERATING AND EMERGENCY RESPONSE MEASURES TO PROTECT THE PUBLIC

WBI Energy maintains operating policies and procedures that are periodically reviewed by the DOT. The policies provide specific directions in regular preventive maintenance and vigilant patrols of facilities, as well as procedures to follow in the event of an accident or natural catastrophe. All operating personnel are trained to perform operations and maintenance activities in accordance with these policies and procedures. Further, periodic training sessions are conducted for operations employees to review typical operating and emergency response procedures or to update employees on changes in procedures. This training includes safe operation of pipeline and aboveground facilities; hazardous material handling procedures;

[1] An identified site is defined as an outside area or open structure that is occupied by 20 or more persons on at least 50 days in any 12-month period; a building that is occupied by 20 or more persons on at least 5 days a week for any 10 weeks in any 12-month period; or a facility that is occupied by persons who are confined, are of impaired mobility, or would be difficult to evacuate.

firefighting; public liaison; and general operating procedures. The proposed Project will be operated and maintained in accordance with each of these policies and procedures.

2.2.1 Line Patrols

WBI Energy will inspect the pipelines periodically on foot, by all-terrain vehicle, or by other vehicle as required by applicable regulatory requirements to identify potential concerns that may affect the safety and operation of the pipelines. Pipeline markers and signs will be inspected and maintained or replaced, as necessary, to ensure that pipeline locations are clearly identified. Field personnel will advise the appropriate operations personnel of new construction along or near the pipeline system. Issues identified are investigated and appropriately remediated based on risk assessment.

2.2.2 Integrity Management

The proposed Project will be hydrostatically tested throughout its entire length before it is put into service. In this procedure, water or test media is introduced into the pipelines and pressurized to a specified level above the maximum allowable operating pressure for a specified amount of time. This test is used to confirm that the facility will operate safely at the designed pressure.

WBI Energy will also conduct a baseline assessment using in-line inspection of the proposed pipelines to check for damage, deformities, or other factors that could affect the integrity of the pipelines. If potential problems are identified, repairs will be made to the affected segment of pipe.

2.2.3 System Control

The proposed Project will be incorporated into WBI Energy's extensive Supervisory, Control, and Data Acquisition System (SCADA). The Gas Control Center is located at WBI Energy's headquarters in Bismarck, North Dakota, and is staffed 24 hours a day, 365 days a year. Gas controllers use SCADA to monitor the pipeline system, which includes a wide range of activities such as monitoring gas pressures and flows along the pipeline, physical startup and shutdown of compressor sites, and operating system valves along the pipeline.

Data acquisition occurs at many locations along the mainline, such as compressor stations, and meter stations. This data is transmitted to Gas Control through SCADA. If system parameters fall outside a predetermined range, an alarm is activated at Gas Control and corrective action is taken by the gas controller as needed. Local WBI Energy personnel are dispatched in response to these alarms if intervention is required outside Gas Control.

2.2.4 Corrosion and Cathodic Protection

49 CFR 192 Subpart I prescribes minimum requirements for the protection of metallic pipelines from external, internal, and atmospheric corrosion. Line pipe used to construct the Project will be externally coated at the pipe mill with fusion bond epoxy. A compatible coating will be applied in the field over circumferential welds and assembly piping will be coated with epoxy-based or tape style coatings.

In accordance with PHMSA requirements, WBI Energy will install cathodic protection systems at various points along the proposed pipelines to inhibit external corrosion of the

underground facilities. This cathodic protection system imparts a low-voltage current to the pipeline to offset natural soil corrosion potential should the coating become damaged over the life of the pipeline. WBI Energy will inspect the cathodic protection system at regular intervals to ensure proper operating conditions consistent with PHMSA requirements for corrosion mitigation.

2.2.5 Pipeline Markers

WBI Energy will install markers at road and railroad crossings, as well as other locations (e.g., fence lines and stream crossings) to indicate the pipeline location and convey emergency information in accordance with DOT safety requirements.

2.2.6 Emergency Preparedness and Procedures

DOT regulations prescribe minimum standards for operating and maintaining pipeline facilities, including a requirement to establish a written plan governing these activities. Additionally, pipeline operators are required to establish an emergency plan that identifies procedures to minimize hazards in a natural gas pipeline emergency to protect the public and the environment. Key elements of the plan include procedures for the following tasks:

- receiving, identifying, and classifying emergency events, gas leakage, fires, explosions, and natural disasters;
- establishing and maintaining communications with local fire, police, and public officials, and coordinating emergency response;
- emergency system shutdown and safe restoration of service;
- making personnel, equipment, tools, and materials available at the scene of an emergency; and
- protecting people first and then property, and making them safe from actual or potential hazards.

WBI Energy currently has an emergency response plan (ERP) for its existing pipeline system in accordance with DOT regulations. WBI Energy will update its ERP, as necessary, to incorporate the proposed Project. The ERP will be made available prior to and during construction and will contain the appropriate emergency contacts (e.g., names and telephone numbers).

2.2.7 Liaison with Local Authorities

The DOT requires that pipeline operators establish and maintain liaison with local fire, police, and other emergency responders to plan for and coordinate emergency response efforts in the event of an incident during construction or operation of the proposed facilities. Each operator must also establish a continuing education program to enable customers, the public, government officials, and those engaged in excavation activities to recognize a gas pipeline emergency and report it to the appropriate public officials. The proposed Project is located within WBI Energy's existing operating counties. As such, WBI Energy will continue to work with the local public officials and emergency responders, and provide appropriate training to responders.

2.2.8 Public Awareness

WBI Energy's public awareness program for its existing pipeline system provides information to the affected public, emergency officials, and public officials, as well as excavators. The messaging includes but is not limited to:

- pipeline purpose and reliability;
- awareness of hazards and prevention measures undertaken;
- emergency preparedness communications;
- damage prevention awareness;
- one-call requirements;
- leak recognition and response;
- pipeline location and operator information;
- National Pipeline Mapping System information; and
- how to get additional information.

WBI Energy will incorporate the Project into its public awareness program.

2.2.9 Damage Prevention

WBI Energy is a member of "One Call" and related pre-excavation notification organizations in the states where it operates, including North Dakota. Through "One Call," contractors or private individuals provide notification of proposed excavations to a central agency that, in turn, will notify WBI Energy of the excavation locations. If WBI Energy facilities are located in the area of proposed excavation, company representatives will mark the pipeline location, consult with the excavator as needed, and observe the excavation as necessary to prevent damage to the pipeline. WBI Energy supports enforceable one-call legislation in all of the states crossed by its pipeline facilities.

1 INTRODUCTION

WBI Energy Transmission, Inc. (WBI) is planning to construct a pipeline crossing of the Missouri River (Lake Sakakawea) within North Dakota, between the cities of Tioga and Watford City as part of the North Bakken Expansion Project. The project involves approximately 60 miles of new NPS 24 (24" O.D.) natural gas pipeline that will connect WBI Energy's Tioga Compressor Station near Tioga, North Dakota, with Northern Border Pipeline Company's mainline at a new interconnection point south of Watford City, North Dakota. The pipeline is for natural gas takeaway to help reduce natural gas flaring in the area. The pipeline alignment crosses the Missouri River approximately 24 miles north of Watford City and 23 miles east of Williston, ND. At the crossing location, the Missouri River forms Lake Sakakawea, which contains a historic channel traversing the lake, and is a United States Army Corps of Engineers (USACE) monitored navigable waterway. This report will focus on the feasibility of the North Bakken Missouri River crossing utilizing the Horizontal Directional Drill (HDD) trenchless construction method. The proposed HDD crossing will cross beneath the entire width of the lake, measuring 15,393 ft in length from entry to exit.

This report is provided as a feasibility assessment of site conditions, incorporating the available geotechnical information and a geometric review of the proposed HDD alignment and design along with annular pressure analysis and pipe stress analysis. Also included are some challenges the contractor may face and some mitigation strategies that may be implemented to minimize the project risks. This assessment is also intended to provide verification that the HDD design meets USACE requirements.

2 DESIGN PARAMETERS

The parameters utilized in the design of the crossing are as follows:

a) The Pipeline Research Council International (PRCI) design guidelines (PR-277-144507-R01) and ASME B31.8 requirements, as applicable, were utilized to model the bending, external hoop, tensile, and combined stress cases for the installation and operating conditions imposed on the pipe.
b) The calculations consider the pipe material, diameter, wall thickness, grade, depth, and the geometric design of the crossing.
c) The geotechnical conditions at the site were analyzed to design the drill for progression through formations that are favorable for horizontal directional drills, where possible, with consideration given to potential borehole instability and surficial casing installation.
d) The HDD crossing was designed by completing an assessment of the annular pressure to minimize the risk of hydraulic fracture to the surface or water body during drilling of the pilot hole. The HDD crossing was designed to have a factor of safety against hydraulic fracture beneath the Missouri River (Lake Sakakawea) of greater than 2.0, as per USACE calculations. The annular pressure calculation models the potential fracture pressure of the overburden formation versus the downhole pressures created during the pilot hole phase of the construction.
e) Space limitations associated with points of inflection (PI), topographical features, and achievable temporary workspace (TWS) were considered. Temporary workspace has been selected to ensure that the required equipment can be set up on site to complete the work and to minimize grading requirements and disturbance.
f) The entry and exit positions have been identified based on the location of the pipe section lay out for installation, generally at the exit location. The drill is designed as an intersect and will have a drill rig set up at both the entry and exit locations.
g) The crossing has been designed with consideration of the pullback section and available layout. These plans will be updated (if required) to allow for multiple sections and/or contractor input.

h) All elevations and topographic survey data utilized are based off North American Vertical Datum 88 (NAVD 88) and State Plane North Dakota North coordinate system.

3 MISSOURI RIVER CROSSING LOCATION

3.1 SITE DESCRIPTION

The proposed HDD crosses the Missouri River (Lake Sakakawea) within McKenzie and Williams County, North Dakota. The proposed pipeline alignment is located approximately 24 miles north of Watford City and 23 miles east of Williston, ND, and is shown in Figure 1, below. The length of the proposed HDD measures approximately 15,393 ft.

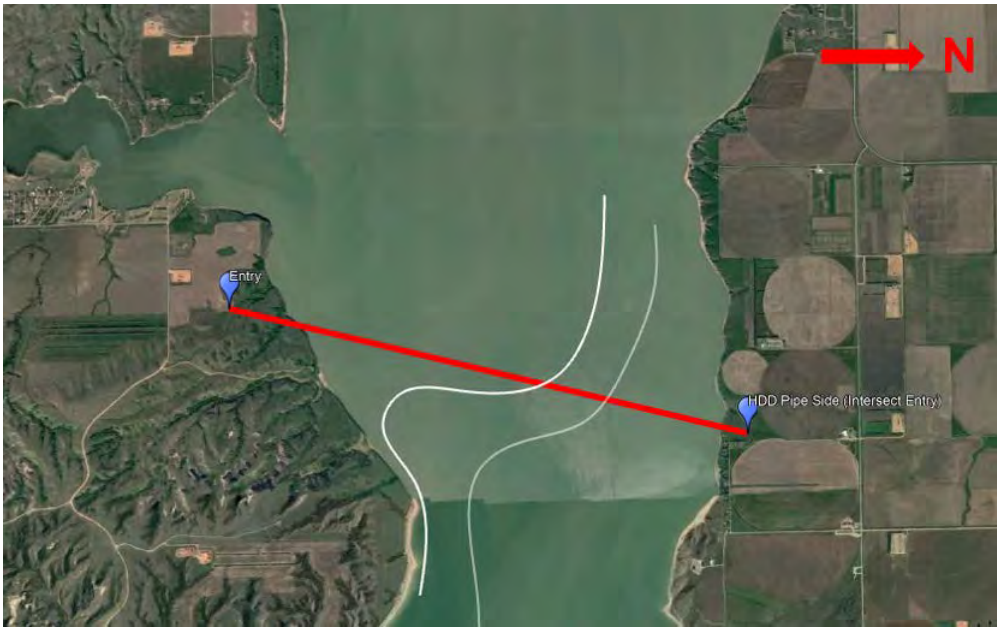

Figure 1. Proposed HDD Alignment Location

The proposed HDD entry location is situated in a relatively level, cultivated grass field, southwest of rugged terrain along the edge of the Missouri River and east of Tobacco Garden Bay. From entry, the HDD alignment follows the proposed pipeline right-of-way down rolling, sloped terrain towards the south bank, crosses the Missouri River (Lake Sakakawea) and climbs the north bank to the location of the HDD exit. The exit location is situated within a maintained grass field, west of several houses along the lake. The pipe string staging and preparation area, shown in Figure 2, is located to the north of the exit point (pipe side) within a proposed temporary workspace area. The planned pipe string and pullback alignment continues to the north, crossing 52nd Street NW and a cultivated field before roping to parallel Highway 17A, ending at Highway 1804 (54th Street NW).

The land near the proposed HDD consists of primarily agricultural fields and grassed areas with several residential buildings in proximity of the northern work site.

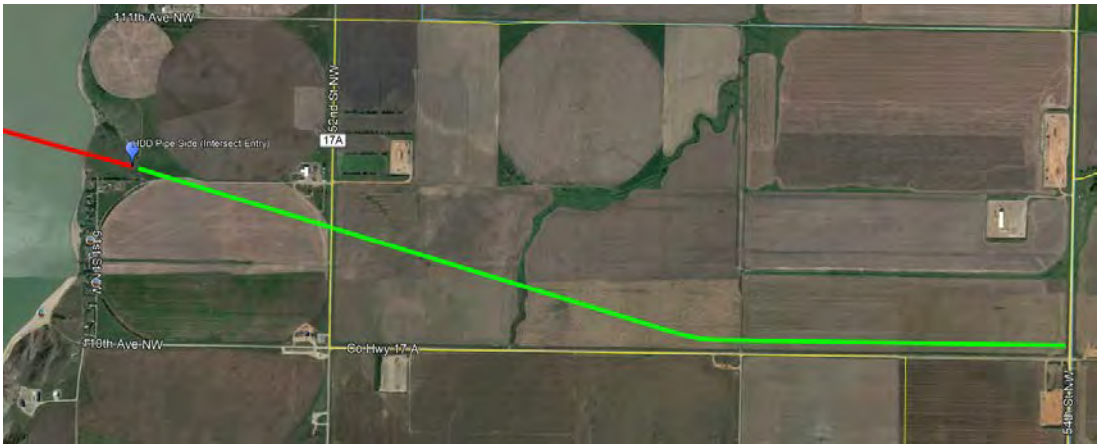

Figure 2. Proposed HDD Pipe Stringing Location

3.2 GEOLOGICAL SETTING

The geology in the area consists of glacial deposits overlying the Sentinel Butte Formation followed by the Bullion Creek Formation, both of the Paleocene Age. The Sentinel Butte Formation consists of layers of silt, clay, sand, lignite, carbonaceous shale, and mudstone. The Bullion Creek Formation comprises primarily silt, clay, sand with interbedded sandstone, lignite, baked clay, and limestone. Both formations are poorly lithified and form rolling topography over areas of Western North Dakota. It is expected that the proposed HDD bore path will be encompassed within the Sentinel Butte Formation and not encounter the Bullion Creek Formation.

3.3 GEOTECHNICAL REVIEW

To form a basis on evaluating the site specific subsurface conditions, CCI sub-contracted Groundwater & Environmental Services, Inc. (GES) to perform a subsurface exploration and laboratory testing program at the proposed HDD site to support the feasibility evaluation and design of the Lake Sakakawea crossing. As part of the geotechnical program, two investigations were completed: one (1) land-based investigation and one (1) water-based investigation. Associated subsequent geotechnical reports entitled "Geotechnical Investigation Report – WBI North Bakken Expansion Project", dated June 14, 2019 and "Geotechnical Investigation Report, Water-Based Borings – WBI North Bakken Expansion Project", dated July 9, 2020 were completed. As part of the land-based investigation, three (3) exploratory land borings, LB-1 to LB-3, were drilled/sampled to depths between 372 and 403 ft below ground surface. As part of the water-based investigation, six (6) additional water-based borings, WB-1 to WB-6, were drilled/sampled to depths between 300 and 315 ft below the Lake Sakakawea thalweg.

The locations of the nine (9) geotechnical borings relative to the HDD alignment are shown in Figure 2, below, and depicted in the design drawing attached in Appendix A.

Figure 3. Borings Location Plan

The borehole coordinates were obtained during the geotechnical investigation by GES using a handheld GPS. The borehole depths and coordinates are shown below in Table 1.

Table 1. Geotechnical Boring Locations and Depths

Borehole	Depth (ft)	Latitude	Longitude
LB -1	403	48.115647°	-103.092842°
LB-2	400	48.117656°	-103.092611°
LB-3	372	48.156139°	-103.077672°
WB-4	300	48.123139°	-103.090536°
WB-5	300	48.128400°	-103.087644°
WB-6	300	48.133994°	-103.086317°
WB-7	315	48.138314°	-103.083792°
WB-8	300	48.146003°	-103.081647°
WB-9	310	48.150150°	-103.079189°

A summary of the encountered subsurface conditions encountered during the geotechnical program, as well as some concerns regarding the geotechnical conditions as they relate to HDD construction operations is listed below in Table 2 and 3. A copy of the detailed geotechnical boring logs from GES' geotechnical investigation is located within the Geotechnical Reports provided in Appendix E.

Table 1. Generalized Summary of the Boring Logs for Missouri River

Borehole	Location	Geologic Description[1, 2]	Primary Geotechnical Concerns
LB -1	Approx. 130 ft NE of entry point, near NE corner of entry pad TWS	0 – 25 ft: Med. Dense Sand 25 – 110 ft: V. Stiff to Hard Lean/Fat Clay and Silt 110 – 211 ft: Hard Fat/Lean Clay 211 – 233 ft: Coal 233 – 288 ft: Highly Weathered, Hard Shale 288 – 403 ft: Hard Silt	Thick coal layer encountered from 211 to 233 ft. Intermittent coal layers/lenses frequently encountered below 233 ft. Fat clays/shale could contain high swell potential.
LB-2	Approx. 930 ft NE of entry point, west side of HDD CL	0 –35 ft: Loose to Med. Dense Silt/Silty Sand. 35-55 ft: V. Stiff Fat Clay 55 – 120 ft: Loose to Dense Sand 120 – 153 ft: Hard Silt and Lean Clay 153 – 215 ft: Highly Weathered Shale and Siltstone	Loose granular materials encountered poses slough risk. Thick coal layer encountered from 215 to 238 ft. Intermittent coal layers/lenses frequently

Borehole	Location	Geologic Description[1, 2]	Primary Geotechnical Concerns
		215 – 238: Coal 238 – 350 ft: Hard Silt 350 – 380 ft: Dense Sand 380 – 400 ft: Highly Weathered Shale	encountered below 238 ft. Fat clays/shale could contain high swell potential.
LB-3	Approx. 100 ft from exit point, along southern edge of exit pad TWS	0 – 115 ft: V. Loose to V. Dense Sand and Silty Sand 115 – 140 ft: Coal 140 – 202 ft: V Dense/Hard Sand, Silt and Lean Clay 202 – 252 ft: Hard Silt with coal lenses 252 – 290 ft: V. Dense Sand 290 – 336 ft: Highly Weathered, Hard Shale 347 – 372 ft: V. Dense Silty Sand	Loose granular materials encountered poses slough risk. Thick coal layer encountered from 115 to 140 ft. Intermittent coal layers/lenses frequently encountered below 140 ft. Shale contains swell potential.
WB-4	Approx. 2,900 ft from entry point, west side of HDD CL	0 – 45 ft: Soft/Loose Lean Clay and Sand 45 – 53 ft: Loose Gravelly Sand 53 – 81 ft: Hard Lean Clay 81 – 102 ft: Highly Weathered, Hard Shale 102 – 127 ft: Coal 127 – 277 ft: Highly Weathered, Hard Shale and Weakly Cemented, V. Dense Sandstone 287 – 300 ft: Highly Weathere, Hard Shale	Granular (alluvial) materials encountered poses slough risk. Thick coal layer encountered from 102 to 127 ft. Intermittent coal layers/lenses frequently encountered below 127 ft. Shale could contain high swell potential.
WB-5	Approx. 4,950 ft from entry point, east side of HDD CL	0 – 35 ft: Med. Stiff/Loose Silt and Sand 35 – 85 ft: Med. to V. Dense Sand and Gravel 85 – 140 ft: Hard/Dense Lean Clay and Sand 140 – 245 ft: Highly Weathered, Hard Shale 245 – 267 ft: Weakly Cemented, V. Dense Sand 267 – 280 ft: Coal 280 – 300 ft: Hard Lean Clay	Thick coal layer encountered from 267 to 280 ft. Intermittent coal layers/lenses frequently encountered below 140 ft. Shale could contain high swell potential.
WB-6	Approx. 7,000 ft from entry point, west side of HDD CL	0 – 70 ft: V. Loose to Med. Dense Sand 70 – 115 ft: V. Stiff Lean/Fat Clay and Silt 115 – 220 ft: Dense to V. Dense Sand 220 – 300 ft: Highly Weathered, Hard Shale	Frequent coal layers/lenses encountered below 220 ft. Fat clays/shale could contain high swell potential.
WB-7	Approx. 8,690 ft from entry point, east side of HDD CL	0 – 56 ft: V. Loose to Med. Dense Sand 56 – 120 ft: Med. Dense/V. Stiff Sand and Lean Clay 120 – 210 ft: Dense to V. Dense Sand 210 – 235 ft: Highly Weathered, Hard Shale 235 – 253 ft: Coal 253 – 315 ft: Highly Weathered, Hard Shale	Thick coal layer encountered from 235 to 253 ft. Intermittent coal layers/lenses frequently encountered below 253 ft. Shale could contain high swell potential.
WB-8	Approx. 3,840 ft from exit point, west side of HDD CL	0 – 35 ft: V. Soft to Med. Stff Lean Clay and Silt 35 – 150 ft: V. Loose to V. Dense Sand 150 – 230 ft: Highly Weathered, Hard Shale 230 – 240 ft: Coal 240 – 290 ft: Highly Weathered, Hard Shale 290 – 300 ft: Coal	Thick coal layers encountered in the bedrock. As well, thinner intermittent coal layers/lenses frequently encountered. Shale could contain high swell potential.
WB-9	Approx. 2,230 ft from exit point, west side of HDD CL	0 – 140 ft: V. Loose to V. Dense Sand and Gravelly Sand 140 – 225 ft: Highly Weathered, Hard, Shale 225 – 235 ft: Coal 235 – 290 ft: Highly Weathered, Hard, Shale 290 – 305 ft: Coal 305 – 310 : Highly Weathered, Hard, Shale	Thick coal layers encountered in the bedrock. As well, thinner intermittent coal layers/lenses frequently encountered. Shale could contain high swell potential.

Note 1: Soil descriptions as per United Soil Classification System (USCS)
Note 2: Soil Consistency and Relative Density determined as per in-situ SPT N-Value

Although variations exist, the subsurface conditions were similar in the nine (9) borings. In general, the subsurface conditions comprised overburden glacial and alluvial deposits to depths between 127 and 290 ft below the surface/thalweg overlying the Sentinel Butte Formation to the depth of the investgation. The glacial and alluvial deposits predominantly consisted of variable deposits of fat/lean clay, sand and silt with thin, frequent interbedded layers of gravel and coal. The consistency of the overburden material increased with depth, starting as soft/loose and becoming hard/very dense. As noted, the bedrock of the Sentinel Butte Formation consisted of primarily poorly lithified shale and sand. Within the formation, two

(2) relatively continuous coal layers were identified along the length of the drill. The coal layers varied in thickness from approximately 5 to 30 ft, with frequently encountered thinner layers/lenses.

Although not encountered in the geotechnical investigation, there is potential to encounter cobbles and/or boulders along the drill path. By definition, glacial deposits consists of a variations of all soil types, including a random distribution of cobble and boulder sized materials, and granular layers/lenses.

No standpipes were installed. Rather, groundwater conditions were inferred from seepages noted and measurements taken during drilling. For the land-based borings, water was observed at 24 ft in LB-3 whereas LB-1 and LB-2 remained dry; however, in each of these borings mud-rotary drilling commenced at a depth of 25 ft, precluding deeper measurements. No groundwater measurements were obtainable in the water-based borings since a perfect seal was not feasible on the casing through the lake. It is expected that the groundwater is situated at an elevation equivalent to the elevation of Lake Sakakawea.

The proposed HDD is anticipated to be within shale of the Sentinel Butte Formation for most of its length, passing through overburden/alluvial deposits as it nears surface at the entry and exit locations. As noted, the overburden/alluvial deposits consist of variations of fat/lean clay, sand and silt. Two relatively continuous coal layers, approximately 5 to 30 ft thick, are proximate to the bottom tangent of the bore path.

4 HDD CROSSING CONSIDERATIONS

4.1 PIPE SPECIFICATIONS

The pipeline specifications provided by WBI are summarized in Table 3. These parameters were used in the engineering design of the Missouri River HDD crossing.

Table 3. Pipe Specifications for the Missouri River HDD Crossing

Parameter	NPS 24 HDD
Outside Diameter (inch)	24
Wall Thickness (inch)	0.99
Pipe Material	Steel
Carried Product	Natural Gas
Specification	API 5L
Grade	X60
Specified Minimum Yield Strength (SMYS) (psi)	60,000
Chosen Design Radius (ft)	5,000
Minimum Allowable Design Radius (MADR) (ft)	1,500
Entry Angle	15°
Exit Angle	14°
Borehole Diameter (inch)	36
Maximum Operating Temperature (°F)	100
Minimum Installation Temperature (°F)	60
Maximum Operating Pressure (psi)	1,480

4.2 HDD ALIGNMENT

The proposed crossing follows a southwest to northeast alignment with the proposed entry and exit (pipe layout) points located approximately 2,100 ft south and 850 ft north of the Missouri River edge of water, respectively. The crossing passes beneath the lake for approximately 12,300 ft. Temporary workspace (TWS) is required at both ends of the crossing to facilitate entry and exit-side construction spreads, which are planned to have workspace dimensions of 300 ft x 300 ft (on the south) and 270 ft x 300 ft (on the north).

The proposed crossing is planned to be completed by intersect methodology, approximately 6000-9000 ft will be competed from either direction, the drill paths will intersect within a 3200 ft "intersect zone". The details of the design are shown on the Issued for Permit (IFP) HDD design drawing [2386-EG-0101, Rev G, dated July 31, 2020] provided in Appendix A.

4.3 BOREHOLE SIZE

The final borehole diameter must be larger than pipe outer diameter to facilitate pipeline installation and reduce the drag forces acting on the pipe while allowing for proper drilling fluid circulation within the annulus. The general industry standard for pipes with diameter more than 20 inches is a final borehole diameter 12 inches larger than the pipe outer diameter. For the proposed NPS 24 HDD crossing, the minimum final borehole diameter is expected to be 36 inches.

4.4 ENTRY AND EXIT ANGLES

The entry and exit angles have been selected based on expected geologic formations and casing requirements, bending restrictions, topography and the support of the pullback section. The entry angle (south) has both been selected to be 15° for this crossing to minimize casing requirements while adhering to geometric constraints and depth. The exit angle was selected to minimize casing requirements on exit while considering the overbend support height and support equipment requirements. The exit angle has been designed to be 14° for the proposed crossing. Due to the pipe size and specification, significant equipment is still required to lift and safely support the pipe above ground during installation. The risks associated with above-ground pipe support equipment requirements on site will be discussed further in the construction risk assessment.

4.5 HDD DEPTH OF COVER

Selection of an HDD depth is based on several parameters including geological formation, casing requirements, required overburden pressure to overcome the drilling fluid annular pressure (while maintaining an adequate factor of safety), and watercourse geometric parameters. The proposed installation depth considered should maximize the length of drill advancing through favorable materials for directional drilling to maximizing borehole stability during hole opening and pipe installation. The drill path is designed to avoid the coal layers identified in the geotechnical investigation for as much of the drill path as possible.

The bottom tangent depth for the proposed NPS 24 HDD is around 250 ft below the bottom of the lake. It is expected that the majority of the drill path will be within shale of the Sentinel Butte Formation based on the 9 geotechnical borings described above. The design depth for the proposed crossing is expected to provide adequate overburden pressure to counteract the expected drilling fluid pressures while utilizing the HDD pilot hole intersect method. Further details about annular pressure modeling are discussed in Section 5.1.

4.6 DESIGN RADIUS

The standard practice in the HDD industry is to utilize 1,200 times the nominal pipe diameter (in ft) as the design radius of curvature (ROC). For example, an NPS 24 (2 ft O.D.) pipe would utilize a 2,400 ft ROC. This is a general "Rule of Thumb" for quick calculations which has been developed over the years based on constructability as opposed to pipe stress limitations. The minimum vertical curve chosen for the proposed HDD is 5,000 ft, which is much larger than the minimum based on the above criteria. This increased design radius has been chosen to assist in ease of steering for the contractor during construction. Applying the design radius, the bending stress and operational shear stress have been calculated to be 13.1% and 48.1%, of allowable, respectively.

An essential part of the design of HDD crossings is providing the contractor with minimum steering tolerances during pilot-hole based on an acceptable level of stress on the pipe. These tolerances are designed to allow the contractor to follow the designated drill path as closely as possible while avoiding any variation that may result in overstressing the product pipe. CCI has calculated the minimum allowable design radius (MADR) for the pipe based on limiting the bending stress to less than 45% of allowable (as per PRCI). For this crossing, an additional design factor has been added to this typical MADR calculation, in order to ensure major variations from the design radius which may negatively affect installation pull-forces are avoided. In addition to the calculated 3-joint minimum allowable design radius (MADR), CCI recommends the additional minimum 1-joint radius specification as shown in Table 4.

Table 4. Minimum Radius Allowances

	Radius Specification
30ft (single-joint)	Minimum ROC – 1,100 ft
100ft Average (3-joint) / MADR	Minimum ROC – 2,000 ft
Design Radius	5,000 ft

If the contractor adheres to these minimum radius specifications, the product pipe will be within allowable stress limits during installation and operation. It should be noted that a recommended single-joint minimum radius has been included, which is sometimes not specified within HDD designs. Without a single-joint radius specification, it is possible that the contractor may be able to include an excessive steer within a single joint, yet still adhere to the provided 3-joint minimum radius average. In order to avoid overstressing of the pipe that may occur in such an instance, adherence to the single-joint radius specification is recommended.

4.7 LAYDOWN AREA

The design proposes that the product pipe be laid out in one (1) continuous section. The proposed pullback workspace is 100 ft wide and crosses an unnamed road and 52nd Street NW (Highway 17A). The proposed pullback alignment also crosses an un-named creek which would likely require two (2) additional side booms to support the pipe from either side of the creek bed. The creek may need to be diverted, bridged, or infilled within the temporary workspace to support machinery traffic and equipment. From an initial desktop study, most of the designated workspace that is planned to be used during pullback will travel through cleared land, so minimal clearing will be required. Near the end of the pullback section, the workspace turns and parallels Co Highway 17A. To accommodate this curve, the pullback includes a 4000 ft radius horizontal curve.

Due to the usage of 52nd Street, it is expected that it will not be possible to close for pullback and it is expected the pipe will be lifted and supported over the road during pullback operations after final welds.

Due to the pipe size, a significant excavation length would be required if the pipe were to be strung under the road in a culvert. The culvert option could be investigated if permission to support the pipe over the road are not granted.

Based on CCI's stress analysis, the minimum allowable overbend radius of the pullback section is roughly 1,600 ft for the NPS 24 pipe. The stress analysis also yielded a maximum crane/side boom support spacing of 80 ft (based on typical roller-cradle capacities) and roller spacing of 40 ft, assuming adequately sized supports will be used. It is also recommended the maximum unsupported overhang not exceed 60 ft. The overbend radius and maximum support spacing was selected to maintain the imposed stress on the product pipe below 80% of allowable stress as per PRCI and with consideration of roller-cradle capacities.

The pullback alignment described above encounters a relatively level topography, with one geographically noticeable hill approximately 2,800 ft north along the pipe stringing alignment. The hill is gradual and should not affect pullback operations. Given the 14° exit angle, the height of the pullback overbend will reach approximately 35 ft above ground surface. This overbend results in approximately 6 cranes and 3 side booms to support the pipe within the overbend.

At the end of the existing 100 ft wide workspace, CCI has proposed an additional 40' of workspace, ending at the road surface of 54th Street NW. This additional workspace is to allow the pipe to be laid out in one section. Due to the topographical elevation changes within the layout, it is expected the pipe will not be as close to the road as is conservatively shown on the Issued for Permit (IFP) HDD design drawing [2386-EG-0102, Rev D, dated July 31, 2020] provided in Appendix A.

5 HDD ENGINEERING ANALYSES

The proposed HDD design has incorporated supplied topographical information, geotechnical information, and ROW alignment. In addition to these considerations, detailed annular pressure analysis and pipe stress analysis calculations have been completed as outlined below.

5.1 ANNULAR PRESSURE MODELING

The annular pressure (AP) was modeled to simulate the downhole pressure during the pilot hole phase of construction and compare it with the limiting pressure of the substrata above the drill path. The AP simulation was conducted with CCI's analysis tools, which have been developed with industry standard calculation models (Bingham Plastic, General Overburden, and USACE/Delft model) and additional modified safety factors based on our experience from over 15,000 completed HDD crossings. CCI developed geotechnical parameters for the crossing that are closely representative of the soil formations observed in the land boring logs and water boring logs completed by GES at the crossing.

Drilling fluid properties, used to model the downhole pressure during drilling, are dependent on construction practices of the HDD contractor, field conditions, and interpretations of the drilling fluid technician. Annular drilling fluid pressures can significantly change with changes in drilling fluid properties. Therefore, it is important to re-evaluate drilling fluid pressures based on fluid properties during HDD operations and compare them with estimated limiting pressures of the formation. Additionally, annular pressure measurement tools should be used to monitor annular pressure during the HDD installation.

The drilling parameters utilized by CCI for this analysis are based on tooling specifications provided by the drilling contractor and are as follows:

- 13 1/2" drill bit (pilot)
- 7 5/8" drill pipe

- 650 gpm (2.5 m^3/min) fluid pump rate
- 9.6 lb/gal fluid density
- 25 lb/100ft^2 yield point of fluid
- 20 cP plastic viscosity of fluid

Calculated expected annular pressure graphs for each drill direction were produced with the above drilling parameters and are modeled in Figure 3 and Figure 4. These annular pressure graphs form the basis for establishing whether a proposed HDD crossing is at risk for hydraulic fracture during the pilot hole phase. This graph shows a calculated expected downhole pressure, as well as an *Operating Zone* above the expected downhole pressure, shown as 125% of the calculated pressure. According to this model, drilling pressures that exceed the overburden fracture pressure do not necessarily indicate a fracture will occur, but rather a higher risk that hydraulic fracture may occur in those areas.

CCI has reviewed and incorporated the geotechnical program laboratory testing results from the geotechnical investigation and developed three geotechnical parameter sets for this crossing. These geotechnical parameter sets represent a “Firm CL-CI Clay” layer at surface, a variable thickness “Compact Sand” layer, and a “Shale Bedrock” layer in which the drill progresses for the majority of the crossing. The Parameters utilized by CCI are listed below.

Firm CL-CI:

- 26° Internal Angle of Friction
- 200 psf Cohesion Coefficient
- 120 pcf Unit weight of Soil
- 0.4 ksi Shear Modulus of the Soil
- Variable Radius of Plastic Zone based on soil parameters

Compact Sand:

- 32° Internal Angle of Friction
- 0 psf Cohesion Coefficient
- 125 pcf Unit weight of Soil
- 2.2 ksi Shear Modulus of the Soil
- Variable Radius of Plastic Zone based on soil parameters

Shale Bedrock:

- 26° Internal Angle of Friction
- 902 psf Cohesion Coefficient
- 131 pcf Unit weight of Bedrock
- 6.7 ksi Shear Modulus of the Bedrock
- Variable Radius of Plastic Zone based on soil parameters

Due to the length of the Missouri River HDD crossing, the crossing will be completed by intersect methodology. Figure 3 and 4 represent the annular pressure curves for the north and south portions of the HDD pilot hole. The Intersect Zone is shown on both drills, and represents the maximum length drilled from either side. The graphs shown are based on a modified CCI Delft equation. The modified Delft equation used here utilizes a smaller Radius of Plastic Zone than the standard Delft equation which results in much lower limiting pressure outputs, equating to more conservative allowable pressures in the curves shown below than would be shown in typical Delft model outputs.

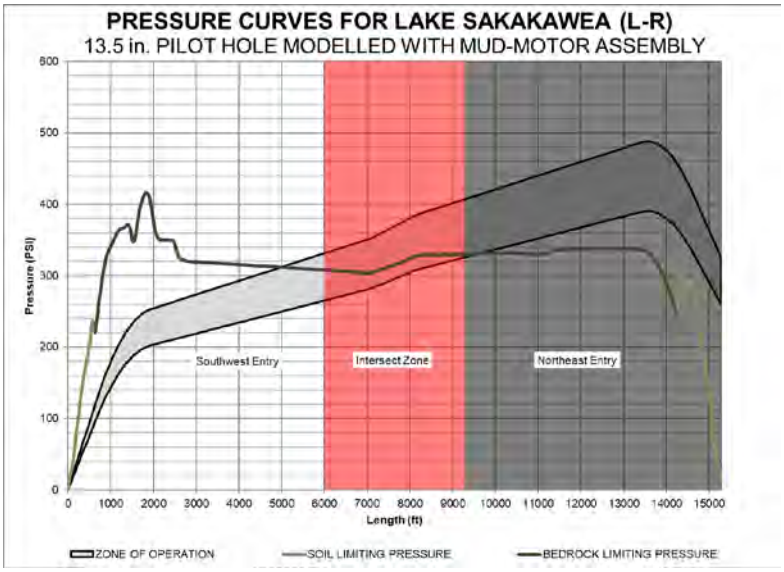

Figure 3. Modeled Annular Pressure During South Pilot Hole

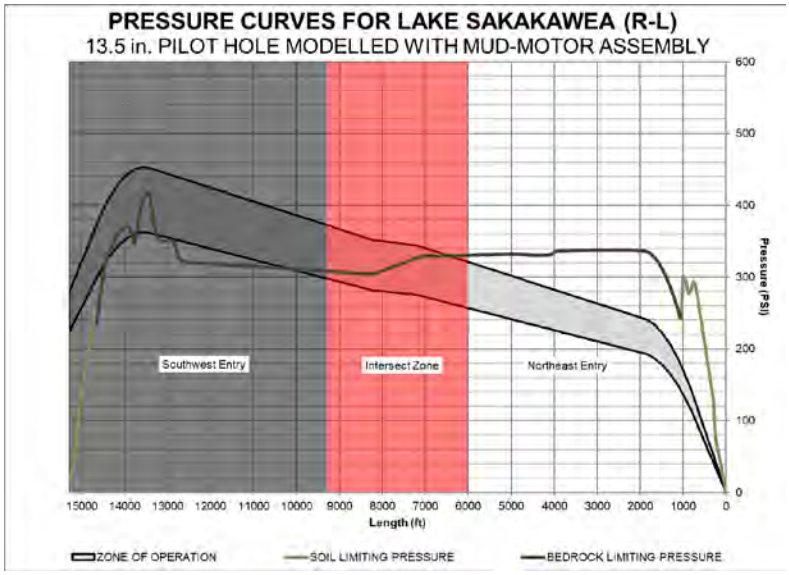

Figure 4. Modeled Annular Pressure During North Pilot Hole

The modified CCI annular pressure graphs above suggest that the drilling pressures remain below the limiting pressures of the overburden along the first 5000-6000 ft of the drill from either side. Within the 5000-8000 ft measured depth range, the lower operating pressures are below or slightly over the limiting over burden pressures. Once past the planned intersect zones, the drilling pressures greatly exceed the overburden pressure, illustrating the need for an intersect based on annular pressure considerations. Within the middle section of the drill, near the intersect zone, the risk of hydraulic fracture for the HDD is moderate.

The annular pressure graphs in Figures 5 and 6, below, have been run using the standard USACE Delft equation. These annular pressure graphs correspond to the factor of safety graphs seen in Figures 7 and 8.

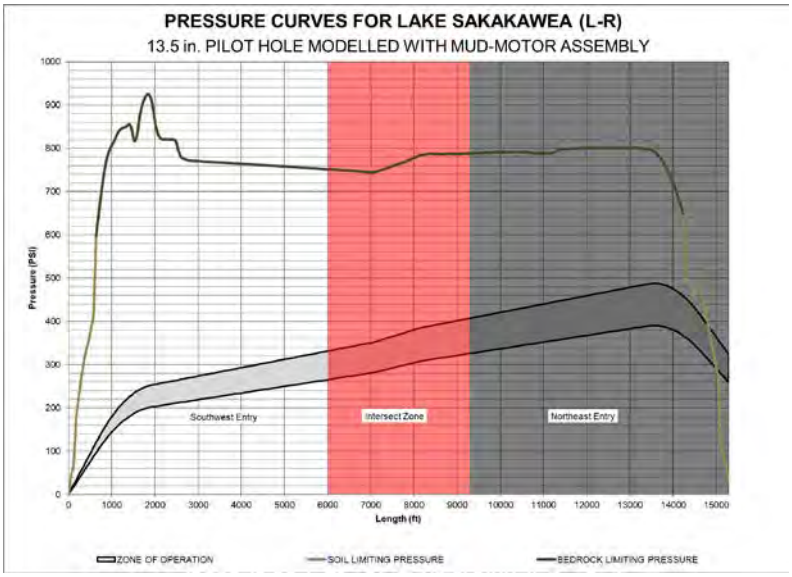

Figure 5. USACE Modeled Annular Pressure During South Pilot Hole

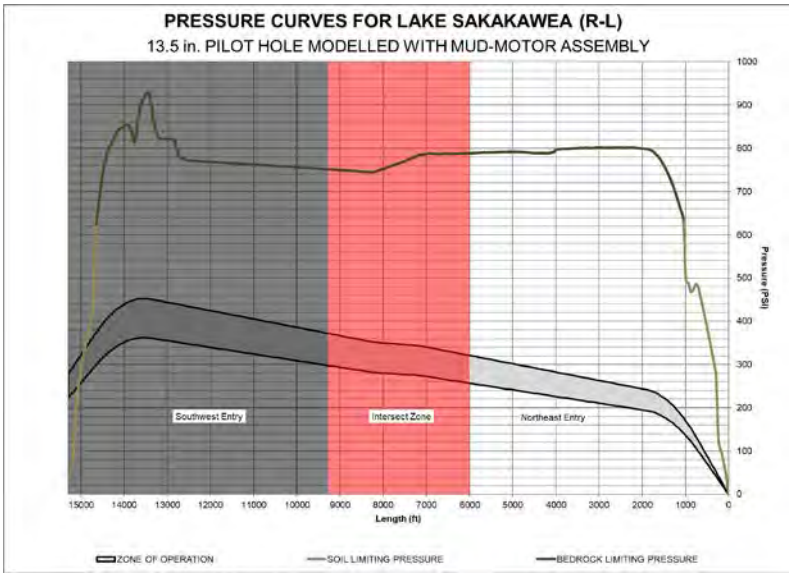

Figure 6. USACE Modeled Annular Pressure During North Pilot Hole

USACE requires a factor of safety against hydraulic fracturing, generally in the 2.0 range, for the portion of the drill passing beneath a regulated waterbody. The factor of safety is calculated by dividing the calculated limiting pressure of the formation by the expected annular pressure along the length of the drill path. Figure 7 and 8 shows the factor of safety against hydraulically fracturing the formation during pilot hole installations utilizing the standard USACE calculation models without any additional factor of safety applied to the equations at the design depth.

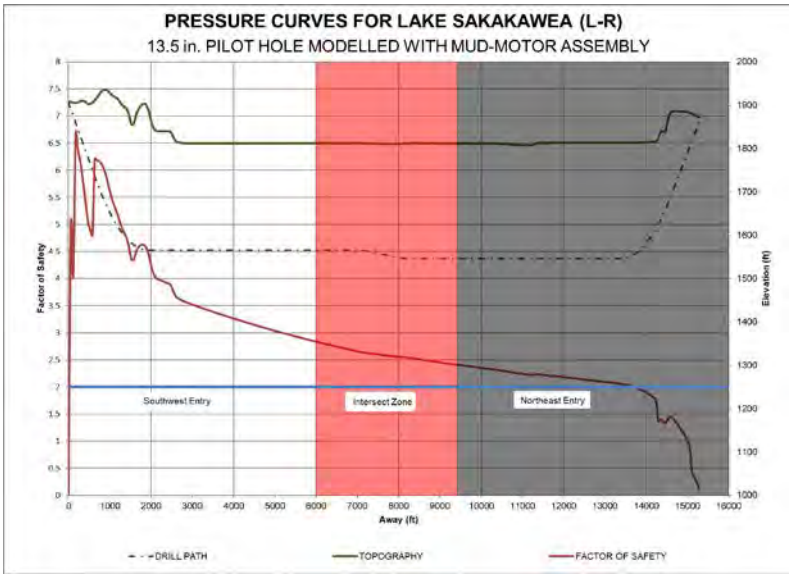

Figure 7. Factor of Safety Against Hydraulic Fracture South Pilot Hole

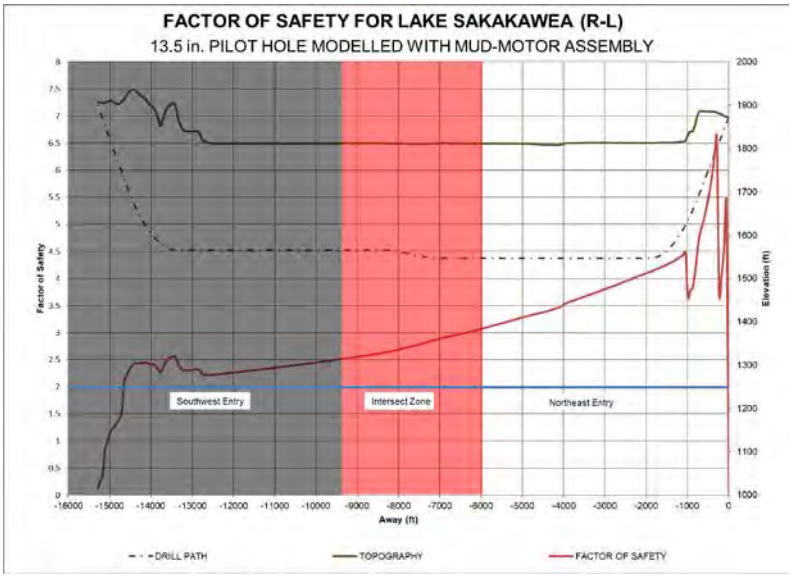

Figure 8. Factor of Safety Against Hydraulic Fracture North Pilot Hole

Figure 7 and 8 indicate that the Factor of Safety (FOS) against hydraulic fracture is above 2.0 for the entire planned pilot hole from the south and north sides. Utilizing USACE calculations, the FOS is roughly 2.5-4 below the Missouri River. Based on the results of the analysis, the HDD design meets the USACE minimum requirements for factor of safety against hydraulic fracture.

During construction, the risk and impact of hydraulic fracture and inadvertent returns (IR) to surface can be reduced by implementing preventative measures during pilot hole. It is recommended that the contractor reduce pump rates as the drills approach the intersect location. It is also recommended that contractor maintain drilling fluid densities at the low end of what is industry standard. An annular pressure

tool should be used during construction to monitor pressures as the drill progresses, avoiding exceeding containment pressures under any critical locations, as required by the USACE. The contractor should review the drilling fluid parameters and tooling and ensure the proposed equipment is in alignment. It may be preferential to utilize a larger drill bit to increase the annular space and decrease the expected pressures.

5.2 HDD STRESS ANALYSIS

The installation and operating conditions imposed on the product pipe during and after installation have been modelled against the respective code requirements as laid out in Section 2. The HDD stress modeling determines if given pipe specifications are adequate for the design.

5.2.1 Pulling Load

To pull the product line inside the borehole, the pull force must overcome several resisting forces including effective weight of the pipe, fluidic drag, frictional drag between the pipe and the borehole walls and between the pipe and the rollers, drag due to length of drill string in the hole, and the reamer assembly in front of the pull section.

The pull force has been calculated with the assumption that the pipe will be installed in one continuous section with no mid-welds as it is suspected there will be sufficient, or nearly sufficient, workspace. It is expected a small section of pipe may need to be pulled into the borehole prior to a single, final weld. This portion of the pipe would be expected to be in the surface casing, and it is not anticipated increased pull forces will be experienced due to this stop near the beginning of pull. If the pipeline installation requires multiple sections beyond this short initial section, the pull forces should be reevaluated to account for the effects of downtime due to intermittent welds during pullback. The soil around the borehole could slough or swell while the pipe remains stationary downhole during the welding process which would result in increased friction on the pipe during pulling.

The calculated expected installation pull force is dependent on the geometry of the HDD, geologic formations present along the drill path, drilling mud properties, and pipe size and weight. CCI has calculated the expected range of pull forces for the product pipe installation, accounting for typical ranges of downhole mud densities. In this analysis, 9.5 ppg (pounds per gallon) drilling fluid is applicable for relatively clean drilling fluid with minimal suspended cuttings, while 12 ppg fluid would be applicable for relatively “dirty” drilling fluid containing significant suspended solids and cuttings. CCI utilizes a safety factor of 1.5 when calculating pull force to account for variations in drilling practices, geology, etc. and addition of the reamer and swivel in the pullback bottom hole assembly. CCI has calculated pull forces for the proposed HDD crossings with and without the additional factor of safety. The calculated pull forces are shown in Table 5. Due to the wall thickness of the product pipe and its associated weight, the pipe is relatively close to neutrally buoyant and therefore buoyancy control is not required for this installation.

Table 5. Pullforce Calculation Analysis

	Drilling Fluid (9.5 ppg)	Drilling Fluid (12 ppg)
Pull force	502,000 lbs	640,000 lbs
Pull force incl. 1.5 x S.F.	752,000 lbs	960,000 lbs

5.2.2 Installation & Operating Stresses

As the pipeline is installed through the final borehole, it is subjected to three primary loading conditions: tension, bending, and external (hoop) pressure. As part of the design process, the individual stresses and their combined effect on the pipe were evaluated to check the pipeline potential for failure.

During operation, the stress imposed on a pipeline installed by HDD is similar to a conventionally installed pipe with the exception of the elastic bending resulting from a continually welded pipeline pulled through a curved borehole. The operating loads including bending, net hoop stress (difference between external and internal pressures), thermal expansion, and combined stresses were checked to evaluate the risk of failure for the NPS 24 product pipe.

The stress analysis completed by CCI based on the design geometry, pipe specifications, and operating conditions for the proposed HDD installation is summarized in Table 6.

A summary of the maximum expected installation and operating stresses and their allowable limits are presented in Appendix B.

Table 6. Installation & Operating Stresses

	Missouri River HDD Crossing	
	Installation Stresses	**% of Allowable (PRCI)**
Maximum Tensile Stress (PRCI 5.1.1, 5.5)	8,935 psi	16.5%
Maximum Bending Stress (PRCI 5.2.2)	5,900 psi	13.1%
Maximum Hoop Stress (PRCI 5.2.3)	2,642 psi	11.3%
Maximum Operating Stress (PRCI 5.4.4.2)	13,000 psi	48.1%
Maximum Combined Installation Stress (tensile and bending) (PRCI 5.2.4)	0.29	29%
Maximum Combined Installation Stress (tensile, bending, and hoop) (PRCI 5.2.4)	0.10	10%

5.2.3 Pipe Lifting Stress Modeling

An analysis was completed to evaluate stresses and imposed loading on the product pipe and supporting equipment during lifting and pullback operations. Minimum support spacing was determined based on pipe specifications and capacity of expected equipment. Summaries of the maximum expected support loading and stresses on the pipe and supports are presented in Appendix B.

The lifting plan requirements including minimum allowable overbend radii, maximum support spacing and maximum allowable overhang to not overstress the pipe or supporting equipment are shown in Table 7. The stresses imposed on the pipeline and loadings on supporting equipment during pullback are also shown. The stress analysis assumes that the pipe is installed empty without buoyancy control.

Table 7. Pullback Support Stresses & Loading

Parameter	
Tensile Stress / % SMYS	10,412 psi / 20%
Bending Stress / % SMYS	18,718 psi / 36%
Combined Tensile & Bending Stress / % SMYS	28,400 psi / 55%
Vertical Load at Support	55,400 lbs
Longitudinal Load At Support	5,540 lbs

Parameter	
Vertical Load at Roller Support	9,700 lbs
Support Spacing	80 ft
Roller Spacing	40 ft
Maximum Unsupported Overhang	60 ft
Overbend Radius	1,600 ft

CCI recommends that designed stresses imposed on the product pipe during pullback are limited to 80% SMYS to account for mishandling in the field during maneuvering and installation. The results from the stress analysis completed for the pullback show that the pipe will be subjected to stresses that are below the recommended limit and are therefore considered acceptable.

CCI recommends that the contractor selects adequately sized lifting equipment and rollers that can handle the expected loadings while providing an adequate factor of safety as per OSHA requirements. CCI recommends that the selected contractor independently evaluate the pullback and pipe lifting plan and account for weather conditions such as snow, rain, and winds to ensure that the equipment and product pipe do not become overloaded or overstressed during pipe handling and pullback.

5.2.4 Design Summary

For this crossing, the operating stresses govern the design of the pipe, and not the installation stresses. Calculations carried out by CCI indicate that the provided pipe specifications are suitable for the HDD installation, based upon the installation and operating conditions supplied.

5.3 HDD CONSTRUCTION RISK ASSESSMENT

The main construction risks and challenges for the Missouri River HDD crossing were identified in the risk assessment conducted by CCI, based on available data and previous experience. The risk items are ranked into the risk categories ranging from low risk to very high risk based on the probability and the consequence of each risk factor.

The descriptions of risk items and a summary of the risk assessment for the crossing detailing the risks prior to any mitigation and after mitigation is presented in Appendix C. The following are major risks and the main mitigation strategies developed.

Casing Installation / Removal:

Casing not Being Installed to Depth

Risk: Geotechnical conditions near surface can pose a problem when driving casing to a designed depth. It is expected both the entry and exit locations will require casing. The entry (south) is expected to be cased to the shale/siltstone bedrock, and the exit location will be cased past the coal layer. The proposed lengths of casing install, although expected to be achievable, are quite considerable.

Mitigation: Achievable casing installation lengths should be investigated prior to construction. The casing should be installed in 160-200ft lengths of telescoped casing. The final casing size shall be 48" and the initial casing should be sized to ensure the final casing will reach the required depth for seating.

Casing Not Being Fully Removed Upon Completion

Risk: Due to the proposed lengths of casing install, the makeup of the subsurface material traversed by the casing, and the expected length of time the casing will remain stationary, there is a risk that the full lengths of casing on either end may not be easily or successfully removed after completion of the product pipe installation.

Mitigation: Contractor shall submit casing plan that includes proper welding specifications to ensure integrity of the casing. Contractor shall also have a mitigation plan for grouting off any portions of casing left below-ground. Owner's integrity management personnel shall evaluate impact of casing left downhole and have a suitable cathodic protection mitigation plan prepared to address any possible related concerns.

Pilot Hole Operations:

Fracture to Water Body

Risk: Fractured formations (including coal seams as identified within the bedrock formation) or high annular pressures could result in release of fluid to surface. The length of the Missouri River crossing results in high pressures due to the building friction forces. The bedrock layer is inconsistent and dips significantly in the middle of the Missouri River, reducing the expected strength of the overburden formation.

Mitigation: The crossing is designed to be completed as an intersect which will limit the expected drilling pressures. The crossing has been designed with significant depth to limit the potential for fracture. Casing will also help with circulation back to entry/exit locations, which should reduce the potential for climbing annular pressures. Contractor shall utilize an Annular Pressure Tool to measure actual downhole pressures during drilling of the pilot hole to ensure any significant increases in pressure beyond planned ranges can be addressed and reduced to within expected ranges with mechanical tripping or additional circulation as applicable.

Large Fluid Loss to the Formation

Risk: Drilling fluid has the potential to migrate outside of the designed drill path in fractures. The crossing location is characterized by several coal seams, including two thick coal seams above and below the bottom tangent of the drill path, which may act as preferential path for drilling fluid.

Mitigation: The drill depth has been chosen to limit the risk of fracture to surface. Casing is included in the design to minimize the amount of coal seams the drill path will encounter. The contractor shall develop a mitigation plan for reducing significant losses where possible, including the use of Loss Circulation Material (LCM) pills to try to plug off any encountered zones of significant fluid loss.

Steering Control Issues

Risk: The crossing is 15,393ft long and each rig will need to drill approximately 7,000 – 8,000 ft. Maintaining weight on bit in order to be able to steer at this length is expected to be difficult, complicating the intersect operations.

Mitigation: The crossing is designed with a large radius which will reduce the steering requirements. The Contractor is utilizing 7 5/8" drill string and gyro steering systems to ensure accuracy and a successful intersect. The bottom tangent is very long and will allow the drills

sufficient time to align for intersect operations. Casing at the entry and exit locations may help to maintain weight on bit.

Annular Pressure Issues

Risk: Drilling operations require soil cuttings to be cleaned out of the bore and hydro-transported back to the rig by the drilling fluid. This process requires large volumes of pressurized drilling fluid to be pumped downhole. The length of the crossing will increase the risk of annular pressure issues.

Mitigation: The Contractor shall maintain returns to both entry pits and monitor annular pressures. A mud engineer shall be on site to monitor adherence to the crossing specific Engineered Drilling Fluid Plan (EDFP). A bottoms up procedure (circulating the calculated amount of fluid that it takes to flow from the bit downhole back up to the entry pit) should be in place and followed when necessary to clean the hole.

Over Schedule Risk

Risk: Geotechnical conditions, permitting, and environmental issues can all contribute to delays in the schedule. The crossing is long with a large borehole size. Over schedule could significantly increase costs. Significant delays could have a large financial impact due to delay to in-service date.

Mitigation: All requirements of the permits should be strictly followed. The Contractor shall ensure proper drilling procedures are in place. Encountered geotechnical conditions should be monitored and reported during drilling so modifications can be made to execution strategy, as required, to ensure no negative impacts. It is recommended construction proceed 24/7 with 2 12hr rotational shifts per day.

Disposal of Drilling Fluid

Risk: Drilling fluid needs to be stored and disposed of. Running out of temporary storage can lead to schedule delays and environmental concerns. The length and large borehole size will result in significant volumes of drilling fluid. Drilling fluid may be contaminated due to coal seams.

Mitigation: Adequate storage should be on site. An EDFP should be followed and an adequate recycling system will be on site. An approved disposal plan should be developed prior to construction. Facility disposal should be expected.

Reaming Operations:

Over Schedule Risk

Risk: Geotechnical conditions, permitting, and environmental issues can all contribute to delays in the schedule. The crossing is long with a large borehole size. Over schedule could significantly increase costs. Significant delays could have a large financial impact due to delay to in-service date.

Mitigation: All requirements of the permits should be strictly followed. The Contractor shall ensure proper drilling procedures are in place. Encountered geotechnical conditions should be monitored and reported during drilling so modifications can be made to execution strategy, as required, to ensure no negative impacts. Using two rigs will split the workload which would be normally be placed upon a single rig.

Loss of Equipment in the Borehole

Risk: Reaming or enlarging the bore to the desired diameter may cause instability areas. These areas may cause downhole tooling to get stuck or lost. Loss of equipment within the borehole is a larger risk than with a shorter crossing.

Mitigation: The utilization of intersect methodology will mitigate the risk of losing equipment within the borehole. Using two rigs will split the workload which would be normally be placed upon a single rig. If problems arise on one side of the reamer, the opposite rig will maintain contact with the downhole tooling and be able to trip to surface. Drill string management plan should be provided by the contractor, which should include regularly switching out drill stem on either side of the reamers.

Poor Removal of Cuttings

Risk: Due to the large ream pass and length a large volume of cuttings will be created and therefore will have to be removed from the borehole.

Mitigation: Drilling fluid parameters will be optimized for maximum cutting transportation, through adherence to the EDFP. High pump rates throughout the ream passes of the HDD will increase the annular velocity and therefore carrying capacity. Additional trips will be necessary to mechanically remove cuttings from the borehole. The number of trips required will be based on the borehole conditions. The cut size should ensure that cuttings can be removed.

Drilling Fluid Control

Risk: As the volume of drilling fluid within the borehole increases, it becomes more difficult to change its properties with drilling fluid additives. The large diameter borehole combined with the length will impact the quality and makeup of the drilling fluid. Coal seams may contaminate drilling fluid. Contractor will be hauling in water.

Mitigation: The Contractor should prepare and adhere to an approved EDFP which will outline the steps required to ensure the highest quality of drilling fluid is used for the crossing. A premix tank should be made available in addition to the mud tank. Contractor should continue to adhere to the EDFP throughout reaming operations even if they are experiencing fluid losses.

Pullback Operations:

Stuck Pipe

Risk: There is a risk that the pipe section becomes stuck in the borehole due to borehole length, instability, blockages, or irregularities. The pullforce for this length is between approximately 502,000 and 960,000lbs.

Mitigation: One or more wiper trips shall be completed to ensure a clean hole. Required force should be monitored during the wiper passes. It is recommended that a Pipe Thruster (with custom inserts for NPS 24) be available on exit side to assist the rig with pullback in the event pullforces start to become exceedingly high.

Pull Forces Exceeding Theoretical Model

Risk: There is a risk that pull forces exceed the theoretical model, especially with the length of the drill. Contributing factors can include cuttings in the borehole, having to temporarily halt line pull, borehole instability, and heavy drilling fluid.

Mitigation: A swab pass should be completed and downtime during installation should be minimized. It is expected pipe pull will continue overnight as required. This should be planned for with crews in advance, lighting shall be sufficient to allow overnight operations for pull. Pipe thruster should be available on exit side to assist the rig will pullback.

Coating Damage

Risk: Gravel, cobbles, boulders, and bedrock interfaces within the bore path pose a risk that the pipe coating is damaged during line pull.

Mitigation: Wiper passes shall be completed to gauge any possible areas of issue, and additional passes may be used to ensure minimized risk prior to pullback. FBE and ARO coated pipe shall be used.

Pipe Handling

Risk: The exit angle, wall thickness, and size of the pipe result in a large radius overbend that reaches a height of 35 ft. The pipe section requires significant support equipment.

Mitigation: A pullback lift plan should be created prior to construction for review and approval. The equipment capacities should be sufficient for the anticipated loads. Spreader bars may reduce crane requirements. A traffic plan should be created for Highway 17A (52nd Street NW) and 54th Street NW (if required).

Pipe Preparation:

Over Schedule Risk

Risk: There is significant support equipment required for pullback. If pullback is delayed this could be a large cost to keep the equipment on site. If the pipe section is not ready for pull the hole could tighten.

Mitigation: A pullback lift plan should be created prior to construction for review and approval. The equipment capacities should be sufficient for the anticipated loads. Spreader bars may reduce crane requirements. A traffic plan should be created for Highway 17A (52nd Street NW) and 54th Street NW (if required). Progress of the HDD should be tracked closely.

Other Risks:

Crossing Length

Risk: The crossing is 15,393ft long, approaching record lengths for an HDD crossing. There is a risk that the crossing could encounter compounding issues that lead to the crossing not being completed successfully.

Mitigation: A competent contractor with adequate tooling and relevant experience with similarly large installations has been selected. The risks should be highlighted to all stakeholders.

Access to Water

Risk: Water sources should be investigated/confirmed. Water transport should be a major consideration.

Mitigation: Additional transport and water sources should be investigated prior to construction. Transport should include contingency to ensure a lack of water does not lead to any delays with progress of the drill, particularly in the event of significant fluid losses during drilling, where large volumes of make-up water may be required.

Public Attention

Risk: Scrutiny is possible in the area. There is a risk of negative public perception issues. The summer season will see high levels of lake use.

Mitigation: The contractor shall ensure all procedures are being followed and their impact is minimized. The contractor shall ensure all correspondence with the public is completed by WBI representation.

6 RECOMMENDATIONS

The following recommendations outline the main action items that should be completed in order to ensure smooth progression of the project into the construction phase:

a) Review of information by all stakeholders and issuance of the Issued for Construction (IFC) drawings incorporating any changes from the Owner, environment, or other consultants.

b) Ensure that all the requirements of the USACE Omaha district are met, and an open line of communication is maintained throughout design and construction.

c) Ensure all required ROW and TWS, environmental notifications and permits, and water withdrawal and disposal sites are acquired.

d) Review the Construction Execution Plan, including but not limited to Pullback Plan, Water Management and Drilling Fluid Disposal Plan, Drilling Rig Anchoring Plan, Casing Plan, and Site-Specific Environmental Plan.

e) Scope of construction inspection, turbidity monitoring and fluid disposal management services should be identified.

f) Review any new environmental concerns with respect to the crossings and develop contingency plans if required.

g) Select an appropriate level of qualified supervision on site for all stages of the drill to ensure that the drill profile is adhered to within the radius limits set forth on the IFC drawing, the proper drilling techniques and equipment are utilized, and schedule and costs are controlled.

h) Select a qualified drilling contractor with experience completing HDD installations of similar size and scope in the area who is familiar with the local geologic formations and associated risks.

7 CONCLUSIONS

This assessment shows the risks identified on the Missouri River NPS 24 HDD crossing and if adequately mitigated, reduces the overall impact on the project. Based on the available data, it is deemed feasible to construct the Missouri River HDD crossing along the proposed North Bakken Expansion Pipeline project

successfully. The crossing is one of the longest HDD crossings completed, and there is potential for an unsuccessful HDD installation, however, this risk will be minimized if the recommendations included within this report are followed.

8 LIMITATIONS

This report has been prepared based on the available site-specific information for the exclusive use of WBI in the construction of the proposed Missouri River HDD crossing. No other warranty is expressed or implied and the information presented within this report shall not be applied to other projects.

Although subsurface conditions are not expected to vary significantly from those shown on the drawings, it should be appreciated that extrapolation of subsurface conditions between boreholes and to depths below the depth of exploration is subject to interpretation and could be at variance with actual field conditions.

NOTES

1. All dimensions are in feet unless otherwise specified. All dimensions are to the centerline of borehole unless otherwise specified.
2. All drill path lengths are rounded to the nearest foot and angles are rounded to the nearest degree, unless otherwise specified.
3. This drawing is based on information provided from various sources. Consulting company does not take responsibility for the accuracy of information provided by others.
4. The crossing shall be constructed in accordance with ASME B31.8 2018.

CONSTRUCTION

5. The estimated theoretical pull force (including safety factor) for this HDD crossing has been calculated to be 752,000 lbs without the consideration of pipeline buoyancy control.
6. Assumed final borehole size is 36".
7. The Contractor shall submit a Drilling Execution Plan for Company approval (prior to start of drilling operations) meeting the minimum requirements of the Contract Documents. Any deviation from the Execution Plan shall only be allowed with Company approval.
8. The Contractor shall verify topographical survey information represented on this drawing in the field prior to construction. Contractor shall inform the Owner of any topographical discrepancies identified.
9. The design drill path and existing utilities being crossed shall have a minimum separation of 10ft.
10. Contractor shall supply and use an approved annular pressure tool capable of operating within the expected pressure range. Annular pressure information provided is based on a mud motor assembly for a 13 1/2" pilot hole.
11. The locations of existing utilities, pipelines and structures shown on the drawing are approximate and shall be verified in the field by the Contractor prior to start of any excavation or pilot hole operations. Verification shall be in accordance with Company specifications and procedures. The Contractor shall ensure any utilities, pipelines and structures in the area are protected and not damaged by the construction.
12. The Contractor shall take specific precautions in protecting existing utilities, pipelines and structures at the entry and exit sites. Such precautions may include: entry/exit pits excavated below existing utilities, casing or sheet piling used to protect pipelines, ramping/matting and special drilling precautions employed during drilling. These precautions shall be used to ensure the drilling tools, pipe and product pipe maintain a safe distance from the existing pipelines, utilities and structures.
13. The Contractor shall assess the need for temporary casing, including both small diameter "wash-over" type casing during pilot hole, and large diameter hammered-in place casing. If large diameter casing is utilized, casing shall be sized to accommodate the final ream pass and shall utilize centralizer casing within the temporary conductor casing. Casing diameter, wall thickness, grade, and drive shoe design shall be determined by the Contractor. A Contractor's Casing Plan shall be submitted and approved by Company prior to casing installation. All temporary casings shall be removed at completion unless otherwise noted.
14. The pilot hole shall be drilled along the design drill path with the designated design radius of curvature shown in the drawing. The pilot hole shall be within the pilot hole tolerances noted on the drawing.
15. The design radius for this crossing is 5000 ft. The pilot hole drilling shall adhere to the following tolerances:
    30ft (single joint) radius shall not be less than 1100 ft
    100ft (3-joint) average radius shall not be less than 2000 ft
16. Crossing to be completed using an intersect methodology utilizing an HDD rig on either side of the crossing. Intersect shall be planned for near the mid-point of the drill geometry in order to ensure minimized risk of drilling fluid release throughout the drill.
17. This engineered design is based on the following minimum equipment requirements that the Contractor shall have onsite:
    a. Drilling Equipment:
    - Drilling Rig with a minimum pull force of 1,000,000 lbs;
    - Drill Pipe 7 5/8" (inspected as per the HDD specification);
    - Drill Bit – 13 1/2" in diameter or larger (provide details, condition, and supplier);
    - 8" Mud Motor or larger capable of running within its specified maximum load range (provide details, condition, and supplier);
    - Annular Pressure Tool (0 to 510 psi range);
    - Reamers designed for the formation (provide manufacturer's operating specifications, condition, and supplier);
    - Gyroscopic steering system;
    - Casing (specifications and details to be provided for approval).

    b. Drilling Fluid Recycling Equipment:
    - Pump Capacity (Operable Rate – 1050 gpm);
    - Shakers (Operable Rate – 1050 gpm);
    - Centrifuge/Desander/Desilter (Minimum Capacity of 1050 gpm);
    - Engineered Drilling Fluid Plan must be able to be implemented in the field with the proposed equipment.

    c. This is a minimum list of equipment and should not be considered a directive on how to complete the work. The Contractor is responsible for the execution of the work under its Approved Execution Plan and shall supply all necessary equipment to complete its plan at its own cost. All equipment shall be supplied in good working order, maintained, fueled and serviced.
18. Drilling Fluid is assumed to have a maximum density of 10 lbs/gallon and 1.0% sand content.

ENVIRONMENTAL

19. Emergency response spill kits must be on-site and available for use for the duration of the project.
20. Terrestrial "inadvertent return walks" shall be initiated every 4hrs. (at a minimum), or immediately following a loss of fluid event.
21. Contractor's proposed drilling fluid composition, including all expected additives, shall be reviewed and approved by the Owner's representative prior to construction.
22. The watercourse must be monitored for a potential release of drilling fluid and to assess the immediate effects of the works on the aquatic environment in accordance with applicable Federal and State regulations.
23. The Contractor shall ensure that the following documentation is on-site and readily available at all times (at a minimum):
    a. Emergency Response Procedure (ERP);
    b. Environmental Protection Plan (EPP);
    c. MSDS for all on-site material;
    d. Copies of Land Use Agreements.

GEOTECHNICAL

24. A land-based geotechnical investigation was completed at this site by Groundwater and Environmental Services, Inc (GES), and can be referenced from the report titled "Geotechnical Investigation Report WBI North Bakken Expansion Project", dated June 14, 2019. A supplemental water-based geotechnical investigation was also completed and can be referenced from the report titled "Geotechnical Investigation Report Water Based Borings", dated July 9, 2020.
25. The soil and bedrock stratigraphy shown is based on interpretation of data from three (3) land-based boreholes, and six (6) water-based boreholes, drilled at the locations shown and the designer's understanding of the local geology. Due to natural variations in subsurface conditions and inherent uncertainties associated with the interpretation of subsurface data, some variation in stratigraphy between boreholes and along the length of the bore should be expected.
26. The Contractor should independently evaluate the crossing with due consideration given to the suitability of its proposed equipment and construction procedures. Proposed construction means and methods shall be submitted to Company for approval but remain the sole responsibility of the Contractor.

PULLBACK NOTES

1. This drawing is engineered and designed to ensure the pipe section is not overstressed during the installation process.
2. This drawing is developed to inform the Contractor of the maximum spacing, anticipated lifting heights, minimum loading requirements and the minimum amount of support equipment to be provided by the Contractor. It is expected that the Pipeline Contractor will choose the type and size of equipment to manage the minimum loads provided.
3. The shown spacing and heights of supports represent a modeled maximum total stress on the pipe (including tension, bending and shear stress at the supports) of 80% of SMYS.
4. The support placement and spacing shown is based on provided topographical survey data. The Contractor shall field fit equipment according to the terrain or other on-site requirements adhering to a maximum spacing provided of 80ft between any two supports.
5. This drawing is based on information provided from various sources. Contractor shall confirm the accuracy of information prior to construction.
6. All loads shown assume that no buoyancy control will be utilized for this pullback.
7. All dimensions are to the bottom of pipe.
8. It is anticipated that all support equipment will utilize roller cradles during the pullback operation. Load capacity of each roller cradle is 56,500lbs (24"-36" roller cradle model). The load capacity shall be confirmed prior to use.
9. Equipment shall be sized with an adequate safety factor (2.0x or greater) to safely handle expected loads and to suit the heights recommended to facilitate the proper radius of curvature. It is expected that extended boom lengths or ramping under the side-booms may be necessary.
10. Shown pipe roller spacing based on roller load capacity of 12,000lbs. Roller spacing shall be adjusted to suit model of roller used.
11. It is the Contractor's responsibility to ensure they have crossing agreements from all utility and pipeline companies in the area where work will be performed overtop or in the vicinity of high pressure pipelines or utilities.
12. Proper padding/ramping above existing lines is required for all areas in which heavy equipment is moved or placed where the equipment may impact these lines.
13. Contractor shall ensure that there is minimal public disturbance and disruption during all parts of the work.
14. Contractor shall be prepared to work with other Contractors in the area.
15. Care shall be taken in manipulating the first and last section of pipe throughout the pullback. The maximum unsupported length at the leading and trailing ends of the pull section shall not exceed 60ft in order to prevent overstressing of the pipe.
16. Contractor shall implement an adequately sized catch off tractor as an anchor when the pipe section involves a slope, horizontal curve and/or a high to low installation. The tractor must be secured to the pipe section in an acceptable manner such as a pull head.
17. Contractor shall consider other factors such as weather conditions (wind, rain, snow, etc.) and site conditions on the pullback operations to ensure a safe lift and installation.
18. Contractor shall secure the load lines on cranes (if required) to the ground to minimize movement of the cradles along the pipe.
19. Contractor to take all precautions to minimize damage to pipe coating during pullback. Any damage to coating shall be repaired as specified in contract documents.
20. Contractor shall modify this plan (as required) to ensure the pipe pull section is sufficiently supported at all times during pullback. Contractor must provide a Pullback Plan for approval by the owner's representative two weeks in advance of commencing the work.
21. For the support design shown, the largest expected forces are:
    Single Cradle Support
    a. Vertical 55,400lbs
    b. Horizontal 95lbs
    c. Longitudinal 5,540lbs
22. The loads on the supports during pullback resolve to three directions; vertical, horizontal and longitudinal. The vertical direction is the weight of the pipe, the horizontal direction results from horizontal curves and the longitudinal direction results from the pipe being pulled through the cradles. A diagram can be seen in the detail to the right.

APPENDIX B – HDD STRESS SUMMARY

Owner:	WBI Energy Transmission
Project:	North Bakken Expansion
Date:	2020-07-29
Calculation Description:	Stress Assessment NPS 24 HDD
Applicable Crossings:	Lake Sakakawea - 9.5 lb/gal Fluid

CCI & Associates Inc.

Completed By:	KP	Reviewed By:	JT	Sheet Revision:	R19.1

Pipe Information			Design Criteria				Crossing Characteristics	
Pipe Diameter (in)	Pipe W.T. (in)	Pipe Grade (psi)	MOP (psi)	Max. Operating Temperature (°F)	Installation Temperature (°F)	Design Radius (ft)	Maximum Depth From Entry Location (ft)	HDD Length (ft)
24	0.990	60000	1,480	100	60	5000	361	15393

The pipe section installated stresses are modelled in 5 sections (exit tangent (5), exit arc (4), bottom tangent (3), entry arc (2), entry tangent (1)) incorporating effects of buoyancy, soil friction, curvature, fluidic drag and pipe weight. The calculated stresses are evaluated using the AGA method (PRCI). Operating stresses incorporate hoop, bending, tensile, and thermal expansion.

Variable Definitions:

F_y - Specified Minimum Yield Strength
D - Outer Diameter of Product Pipe
E - Young's Modulus (Steel)
t - Wall Thickness of Product Pipe

Tensile Stress:

			% of Allowable

The pipe pullback is modelled such that the pipe is not over-stressed due to the combination of bending, tensile, and shear stresses throughout the pullback section, both in the spans between supports and at the support locations.
The pullback is also modelled such that the supports are not overloaded with the weight of the pipe at any point during the pipe installation, including as the tailing end passes from support to support.

Definitions:

SMYS - Specified Minimum Yield Strength
Overhang - Where Unsupported Tail End of Pipe Extends Beyond Support
Full Span - Where Pipe Is Supported Between 2 Supports at Maximum Support Spacing Shown Above

SUPPORT LOADING

Vertical Load at Each Boom/Crane Support — **% of Support Capacity ***

At Support With Full Span:
25,100 kg 55,400 lbs — **97.9%**

Mud Motor HDD Risk Assessment

No.	Risk/Issue	Type of Risk/Issue		Pre-Mitigation Probability	Pre-Mitigation Consequence	Post-Mitigation Probability	Post-Mitigation Consequence	Review Cost Needed?
Installation of Casing (Entry and Exit Points)								
1a	Casing not Being Installed to Depth	Safety and Health	-	4	3	3	3	Select
		Environment	-	High Risk		Medium Risk		
		Financial	-	**Description**		**Mitigation Strategy**		
		Production/Schedule	-	Geotechnical conditions near surface can pose a problem when driving casing to a designed depth. It is expected both the entry and exit locations will require casing. The entry (south) is expected to be cased to the shale/siltstone bedrock, and the exit location will be cased past the coal layer. The proposed lengths of casing install, although expected to be achievable, are quite considerable.		Achievable casing installation lengths should be investigated prior to construction. The casing should be installed in 160-200ft lengths of telescoped casing. The final casing size shall be 48" and the initial casing should be sized to ensure the final casing will reach the required depth for seating.		
		Reputation	-					
		Business Impact	-					
Pilot Hole								
2a	Fracture to Surface (Entry or exit, whichever poses as the greatest risk)	Safety and Health	-	3	3	3	2	Select
		Environment	Yes	Medium Risk		Medium Risk		
		Financial	Yes	**Description**		**Mitigation Strategy**		
		Production/Schedule	Yes	Granular material near surface can pose a potential risk for drilling fluid to fracture to surface. The crossing is characterized by well graded to poorly graded sand to depths of 20-120ft.		The sand is expected to be stable enough to maintain an open borehole, or cased. The topography near entry and exit is relatively flat and allows the drill to obtain sufficient depth to effectively mitigate the risk of fracture.		
		Reputation	-					
		Business Impact	-					
2b	Fracture to Water Body	Safety and Health	-	3	4	2	4	Select
		Environment	Yes	High Risk		Medium Risk		
		Financial	Yes	**Description**		**Mitigation Strategy**		
		Production/Schedule	Yes	Fractured formations (including coal seams as identified within the bedrock formation) or high annular pressures could result in release of fluid to surface. The length of the Missouri River crossing results in high pressures due to the building friction forces. The bedrock layer is inconsistent and dips fairly significantly in the middle of the Missouri River, reducing the expected strength of the overburden formation.		The crossing is designed to be completed as an intersect which will limit the expected drilling pressures. The crossing has been designed with significant depth to limit the potential for fracture. Casing will also help with circulation back to entry/exit locations, which should reduce the potential for climbing annular pressures. Contractor shall utilize an Annular Pressure Tool to measure actual downhole pressures during drilling of the pilot hole to ensure any significant increases in pressure beyond planned ranges can be addressed and reduced to within expected ranges with mechanical tripping or additional circulation as applicable.		
		Reputation	Yes					
		Business Impact	Yes					
2c	Large Fluid Loss to the Formation (>25% of total volume)	Safety and Health	-	4	3	3	3	Select
		Environment	Yes	High Risk		Medium Risk		
		Financial	Yes	**Description**		**Mitigation Strategy**		
		Production/Schedule	Yes	Drilling fluid has the potential to migrate outside of the designed drill path in fractures. The crossing location is characterized by several coal seams, including two thick coal seams above and below the bottom tangent of the drill path, which may act as preferential path for drilling fluid.		The drill depth has been chosen to limit the risk of fracture to surface. Casing is included in the design to minimize the amount of coal seams the drill path will encounter. The contractor shall develop a mitigation plan for reducing significant losses where possible, including the use of Loss Circulation Material (LCM) pills to try to plug off any encountered zones of significant fluid loss.		
		Reputation	-					
		Business Impact	-					
2d	Unstable Borehole (swelling, broken up, etc.)	Safety and Health	-	3	3	2	3	Select
		Environment	-	Medium Risk		Medium Risk		
		Financial	Yes	**Description**		**Mitigation Strategy**		
		Production/Schedule	Yes	Site conditions have identified granular materials at both entry and exit locations. During drilling operations this material can become unstable and collapse, which may cause reduced returns. Casing has been specified on entry and exit.		The Contractor should monitoring annular pressure and returns to ensure the borehole remains clear of obstructions, if returns slow the Contractor should mechanically clean the hole.		
		Reputation	-					
		Business Impact	-					
2e	Steering Control Issues	Safety and Health	-	5	3	4	3	Select
		Environment	-	High Risk		High Risk		
		Financial	Yes	**Description**		**Mitigation Strategy**		
		Production/Schedule	Yes	The crossing is 15,393ft long and each rig will need to drill 7000ft-8000ft. Maintaining weight on bit in order to be able to steer at this length is expected to be difficult, complicating the intersect.		The crossing is designed with a large radius which will reduce the steering requirements. The Contractor is utilizing 7 5/8" drill string and gyro steering systems to ensure accuracy and a successful intersect. The bottom tangent is very long and will allow the drills sufficient time to align for intersect operations. Casing may help to maintain weight on bit.		
		Reputation	-					
		Business Impact	-					
2f	Annular Pressure Issues	Safety and Health	-	5	3	4	3	Select
		Environment	Yes	High Risk		High Risk		
		Financial	Yes	**Description**		**Mitigation Strategy**		
		Production/Schedule	Yes	Drilling operations require soil cuttings to be cleaned out of the bore and hydro-transported back to the rig by the drilling fluid. This process requires large volumes of pressurized drilling fluid to be pumped downhole. The length of the crossing will increase the risk of annular pressure issues.		The Contractor shall maintain returns to both entry pits and monitor annular pressures. A mud engineer shall be on site to monitor adherence to the crossing specific Engineered Drilling Fluid Plan (EDFP). A bottoms up procedure (circulating the calculated amount of fluid that it takes to flow from the bit downhole back up to the entry pit) should be in place and followed when necessary to clean the hole.		
		Reputation	-					
		Business Impact	-					
2g	Over-Schedule Risk	Safety and Health	-	4	3	3	2	Select
		Environment	-	High Risk		Medium Risk		
		Financial	Yes	**Description**		**Mitigation Strategy**		
		Production/Schedule	Yes	Geotechnical conditions, permitting, and environmental issues can all contribute to delays in the schedule. The crossing is long with a large borehole size. Over schedule could significantly increase costs. Significant delays could have a large financial impact due to delay to in-service date.		All requirements of the permits should be strictly followed. The Contractor shall ensure proper drilling procedures are in place. Encountered geotechnical conditions should be monitored and reported during drilling so modifications can be made to execution strategy, as required, to ensure no negative impacts. It is recommended construction proceed 24/7 with 2 12hr rotational shifts per day.		
		Reputation	-					
		Business Impact	-					
2h	Disposal of Drilling Fluid	Safety and Health	-	4	3	3	3	Select
		Environment	Yes	High Risk		Medium Risk		
		Financial	Yes	**Description**		**Mitigation Strategy**		
		Production/Schedule	Yes	Drilling fluid needs to be stored and disposed of. Running out of temporary storage can lead to schedule delays and environmental concerns. The length and large borehole size will result in significant volumes of drilling fluid. Drilling fluid may be contaminated due to coal seams.		Adequate storage should be on site. An EDFP should be followed and an adequate recycling system will be on site. An approved disposal plan should be developed prior to construction. Facility disposal should be expected.		
		Reputation	-					
		Business Impact	-					
2i	Water Ingress to Borehole	Safety and Health	-	3	3	2	2	Select
		Environment	-	Medium Risk		Low Risk		
		Financial	Yes	**Description**		**Mitigation Strategy**		
		Production/Schedule	Yes	Ground water tends to migrate to where soil has been cut/ displaced. Coal seams may provide preferential paths for water ingress into the borehole. The ingress of water may dilute the bentonite drilling fluid and reduce the carrying capacity.		The crossing is level and the hole will be full of drilling fluid. Since the identified seams are below rig elevation, it is anticipated that the hydrostatic pressure of the drilling fluid will minimize water ingress to a manageable range.		
		Reputation	-					
		Business Impact	-					
Reaming Operations								
3a	Unstable Borehole	Safety and Health	-	3	3	2	3	Select
		Environment	-	Medium Risk		Medium Risk		
		Financial	Yes	**Description**		**Mitigation Strategy**		
		Production/Schedule	Yes	Site conditions have identified granular materials at both entry and exit locations. During drilling operations this material can become unstable and collapse, which may cause reduced returns.		The Contractor should monitoring annular pressure and returns to ensure the borehole remains clear of obstructions, if returns slow the Contractor should mechanically clean the hole. Adequate pumps for the ream size and length should be on site.		
		Reputation	-					
		Business Impact	-					
3b	Over-Schedule Risk	Safety and Health	-	4	3	3	2	Select
		Environment	-	High Risk		Medium Risk		
		Financial	Yes	**Description**		**Mitigation Strategy**		
		Production/Schedule	Yes	Geotechnical conditions, permitting, and environmental issues can all contribute to delays in the schedule. The crossing is long with a large borehole size.		All requirements of the permits should be strictly followed. The Contractor shall ensure proper drilling procedures are in place. Geotechnical conditions should be monitored and reported during drilling so modifications can be made to execution strategy, as required, to ensure no negative impacts. Using two rigs will split the workload which would be normally be placed upon a single rig.		
		Reputation	-					
		Business Impact	-					
		Safety and Health	-	3	4	3	3	Select
		Environment	-	High Risk		Medium Risk		

3c	Loss of Equipment in Borehole	Financial	Yes	Description			Mitigation Strategy		
		Production/Schedule	Yes	Reaming or enlarging the bore to the desired diameter may cause instability areas. These areas may cause downhole tooling to get stuck or lost. Loss of equipment within the borehole is a larger risk than with a shorter crossing.			The utilization of intersect methodology will mitigate the risk of losing equipment within the borehole. Using two rigs will split the workload which would be normally be placed upon a single rig. If problems arise on one side of the reamer, the opposite rig will maintain contact with the downhole tooling and be able to trip to surface. Drill string management plan should be provided by the contractor, which should include regularly switching out drill stem on either side of the reamers.		
		Reputation	Yes						
		Business Impact	-						
3d	Poor Removal of Cuttings	Safety and Health	-	4	4		3	4	Select
		Environment	-	High Risk			High Risk		
		Financial	Yes	Description			Mitigation Strategy		
		Production/Schedule	Yes	Due to the large ream pass and length a large amount of cuttings will be created and therefore will have to be removed from the borehole.			Drilling fluid parameters will be optimized for maximum cutting transportation, through adherence to the EDFP. High pump rates throughout the ream passes of the HDD will increase the annular velocity and therefore carrying capacity. Additional trips will be necessary to mechanically remove cuttings from the borehole. The number of trips required will be based on the borehole conditions. The cut size should ensure that cuttings can be removed.		
		Reputation	-						
		Business Impact	-						
3e	Drilling Fluid Control	Safety and Health	-	4	4		3	3	Select
		Environment	-	High Risk			Medium Risk		
		Financial	Yes	Description			Mitigation Strategy		
		Production/Schedule	Yes	As the volume of drilling fluid within the borehole increases, it becomes more difficult to change its properties with drilling fluid additives. The large diameter borehole combined with the length will impact the quality and makeup of the drilling fluid. Coal seams may contaminate drilling fluid. Contractor will be hauling in water.			The Contractor should prepare and adhere to an approved EDFP which will outline the steps required to ensure the highest quality of drilling fluid is used for the crossing. A premix tank should be made available in addition to the mud tank. Contractor should continue to adhere to the EDFP throughout reaming operations even if they are experiencing fluid losses.		
		Reputation	-						
		Business Impact	-						
Pullback Operations									
4a	Pipe Section Gets Stuck in Borehole	Safety and Health	-	3	4		2	4	Select
		Environment	-	High Risk			Medium Risk		
		Financial	Yes	Description			Mitigation Strategy		
		Production/Schedule	Yes	There is a risk that the pipe section becomes stuck in the borehole due to borehole length, instability, blockages, or irregularities. The pullforce for this length is between approximately 502,000 and 960,000lbs.			One or more wiper trips shall be completed to ensure a clean hole. Required force should be monitored during the wiper passes. It is recommended that a Pipe Thruster (with custom inserts for NPS 24) be available on exit side to assist the rig with pullback in the event pullforces start to become exceedingly high.		
		Reputation	-						
		Business Impact	-						
4b	Pull Forces Exceed Theoretical Model	Safety and Health	-	3	4		2	3	Select
		Environment	-	High Risk			Medium Risk		
		Financial	-	Description			Mitigation Strategy		
		Production/Schedule	-	There is a risk that pull forces exceed the theoretical model, especially with the length of the drill. Contributing factors can include cuttings in the borehole, having to temporarily halt line pull, borehole instability, and heavy drilling fluid.			A swab pass should be completed and downtime during installation should be minimized. It is expected pipe pull will continue overnight as required. This should be planned for with crews in advance, lighting shall be sufficient to allow overnight operations for pull. Pipe thruster should be available on exit side to assist the rig will pullback.		
		Reputation	-						
		Business Impact	-						
4c	Coating Damaged during Installation	Safety and Health	-	4	3		3	3	Select
		Environment	-	High Risk			Medium Risk		
		Financial	Yes	Description			Mitigation Strategy		
		Production/Schedule	Yes	Gravel, cobbles, boulders, and bedrock interfaces within the bore path pose a risk that the pipe coating is damaged during line pull.			Wiper passes shall be completed to gauge any possible areas of issue, and additional passes may be used to ensure minimized risk prior to pullback. FBE and ARO coated pipe shall be used.		
		Reputation	-						
		Business Impact	-						
4d	Product Pipe is Damaged during Installation	Safety and Health	-	2	4		1	4	Select
		Environment	-	Medium Risk			Medium Risk		
		Financial	Yes	Description			Mitigation Strategy		
		Production/Schedule	Yes	If the borehole has any ledges (intersect location or bedrock interface), the pipe could get hung up or scratched on these ledges resulting in pipe damage.			Ledges shall be reamed/smoothed out prior to product pipe installation. The intersect should be completed as straight as possible to reduce the potential for a ledges where the bits meet.		
		Reputation	Yes						
		Business Impact	-						
4e	Pipe Handling on Exit	Safety and Health	Yes	4	3		3	3	Select
		Environment	-	High Risk			Medium Risk		
		Financial	Yes	Description			Mitigation Strategy		
		Production/Schedule	Yes	The exit angle, wall thickness, and size of the pipe result in a large radius overbend that reaches a height of 35 ft. The pipe section requires significant support equipment.			A pullback lift plan should be created prior to construction for review and approval. The equipment capacities should be sufficient for the anticipated loads. Spreader bars may reduce crane requirements. A traffic plan should be created for Highway 17A (52nd Street NW) and 54th Street NW (if required).		
		Reputation	-						
		Business Impact	-						
Pipeline Contractor - Pipe Preparation and Support									
5a	HDD Takes Longer than Scheduled to Complete	Safety and Health	-	4	3		3	3	Select
		Environment	-	High Risk			Medium Risk		
		Financial	Yes	Description			Mitigation Strategy		
		Production/Schedule	Yes	There is significant support equipment required for pullback. If pullback is delayed this could be a large cost to keep the equipment on site. If the pipe section is not ready for pull the hole could tighten.			The pullback section should be completed significantly before pull is expected to ensure no unneccesary delays. Coordination of all contractors. Traffic plan for Highway 17A.

Construction Access and Pad Preparation									
6a	Construction Access	Safety and Health	-	2	2		2	2	Select
		Environment	-	Low Risk			Low Risk		
		Financial	Yes	Description			Mitigation Strategy		
		Production/Schedule	Yes	Access is assumed to be along ROW, through agricutural fields.			All agreements should be in place prior to mobilization. All workspace should be cleared as required. Access should be prepared.		
		Reputation	-						
		Business Impact	-						
6b	Pad Layout & Construction	Safety and Health	-	2	2		2	2	Select
		Environment	-	Low Risk			Low Risk		
		Financial	Yes	Description			Mitigation Strategy		
		Production/Schedule	Yes	The workspace are within grassy fields, clearing and grading are expected to be minimal.			All agreements should be in place prior to mobilization. All workspace should be cleared as required.		
		Reputation	-						
		Business Impact	-						
6c	Travel Safety	Safety and Health	Yes	2	2		2	2	Select
		Environment	-	Low Risk			Low Risk		
		Financial	-	Description			Mitigation Strategy		
		Production/Schedule	-	Contractor will have to travel to site from a off project location. Could continue into winter.			A travel plan should be in place.		
		Reputation	Yes						
Other Risks									
7a	Crossing Length	Safety and Health	-	4	4		3	4	Select
		Environment	-	High Risk			High Risk		
		Financial	Yes	Description			Mitigation Strategy		
		Production/Schedule	Yes	The crossing is 15,393ft long, approaching record lengths for an HDD crossing. There is a risk that the crossing could encounter compounding issues that lead to the crossing not being completed successfully.			A competent contractor with adequate tooling and relevant experience with similarly large installations has been selected. The risks should be highlighted to all stakeholders.		
		Reputation	Yes						
		Business Impact	Yes						
7b	Access to Water	Safety and Health	-	4	4		3	3	Select
		Environment	-	High Risk			Medium Risk		
		Financial	Yes	Description			Mitigation Strategy		
		Production/Schedule	Yes	Water sources should be investigated/confirmed. Water transport should be a major consideration.			Additional transport and water sources should be investigated prior to construction. Transport should include contingency to ensure a lack of water does not lead to any delays with progress of the drill, particularly in the event of significant fluid losses during drilling, where large volumes of make-up water may be required.		
		Reputation	-						
		Business Impact	-						
7c	Public Attention	Safety and Health	-	4	3		3	3	Select
		Environment	-	High Risk			Medium Risk		
		Financial	Yes	Description			Mitigation Strategy		
		Production/Schedule	-	Scrutiny is possible in the area. There is a risk of negative public perception issues. The summer season will see high levels of lake use.			The contractor shall ensure all procedures are being followed and their impact is minimized. The contractor shall ensure all correspondence with the public is completed by WBI representation.

TGCBA	Tobacco Garden Creek Bay Area
USACE	US Army Corp of Engineers

1 Introduction

This report presents the results of the geotechnical investigation that was performed by Groundwater and Environmental Services, Inc. (GES) for the project known as the WBI North Bakken Expansion Project in western North Dakota. Specifically, this report covers the geotechnical exploration at 3 land-based soil borings located along the proposed horizontal directional drilling (HDD) pipeline project under Lake Sakakawea/Missouri River (**Figure 1**). The proposed pipeline alignment under Lake Sakakawea is located approximately 1 mile northeast of the Tobacco Garden Creek Bay Area (TGCBA). The TGCBA is located approximately 23 miles northeast of Watford City, North Dakota.

Services for this investigation were performed in general accordance with the April 1, 2019 Services Contract by and between CCI and Associates, Inc. (CCI) and GES.

1.1 Project Location and Scope

The objective of this phase of the geotechnical investigation is to assist CCI with evaluating the subsurface conditions at 3 land-based boring locations (LB-1 through LB-3) located along the proposed HDD pipeline alignment on the north and south sides of Lake Sakakawea.

The scope of work included the following:

- Prepare a site-specific health and safety plan for GES employees and subcontractors for the proposed geotechnical investigation activities.
- Coordinate field activities and communication with project team and CCI.
- Arrange for utility clearance through North Dakota One Call.
- Mobilize our drilling project team to the project including Interstate Drilling Services, LLP (IDS) and GES personnel.
- Advance 3 land-based soil borings and collect samples at designated locations surveyed by a CCI subcontractor.
- Contract laboratory tests on soil samples obtained from the 3 land-based soil borings to evaluate physical properties.
- Provide a written geotechnical report.

2 Methods

2.1 Soil Borings

As part of the geotechnical investigation, GES contracted with IDS of Grand Forks, North Dakota, to advance the 3 land-based soil borings (**Figure 1**). IDS used a Diedrich D-50 track-mounted drill rig to advance the borings and collect soil samples.

The drilling rig, equipment and supplies mobilized to the project location on April 23, 2019. Advancement of soil boring LB-1 began on April 24 and the last soil boring LB-3 was completed on May 5, 2019. The drilling operation consisted of one crew working 12-hour shifts. Borehole locations for LB-1 through LB-3 were provided by CCI and are provided in **Table 1**.

Soil borings LB-1, LB-2, and LB-3 were completed to depths of 403 feet, 400 feet, and 370 feet below grade, respectively. Hollow-stem auger (HSA) boring methodology was used to collect soil samples while boring through unconsolidated sediment in the upper portion of each soil boring. Once competent sediment was encountered, a closed loop, fluid rotary drilling methodology was used to advance the borings. Rock coring drilling methodology was used at each boring for the last, approximately 200+ feet (to boring terminus). Upon completion, each boring was sealed from the boring terminus to ground surface with a concrete/bentonite slurry through a tremie rod. Drilling cuttings and sediment were thin spread at each boring location.

During HSA and fluid rotary drilling methodology, 1.5-foot samples were collected at 5 foot intervals using a split-spoon sampler in accordance with American Society for Testing and Materials (ASTM) D1586 (*Standard Test Method for Standard Penetration Test [SPT] and Split-Barrel Sampling of Soils*) using a 2-inch diameter split-spoon sampler. During rock coring drilling methodology, samples were generally collected at 5-foot sample intervals continuously in accordance with ASTM D2113 (*Standard Practice for Rock Core Drilling and Sampling of Rock for Site Exploration*) using a using a NQ3 size, triple-tube core barrel with a diamond bit.

Soils were classified in the field by a GES field geologist using ASTM Visual-Manual procedures (ASTM D2488, *Standard Practice for Description and Identification of Soils [Visual-Manual Procedure]*). The field geologist also collected samples from the split-spoon sampler and rock core sampler for geotechnical laboratory testing.

The boring logs and standard boring classification guidelines are contained in **Appendix A**. Photographic documentation of the project is provided in **Appendix B.**

2.2 Laboratory Testing

GES contracted with Material Testing Services, LLC (MTS) of Minot, North Dakota to provide geotechnical laboratory testing and evaluation services to aid in classifying and evaluating the physical properties of the soil/rock samples. Soil/rock sample selection and laboratory test parameters were determined by CCI.

The laboratory testing included the following:

- Moisture Content (ASTM D4959 - Standard Test Method for Determination of Water Content of Soil by Direct Heating and D4643 - Standard Test Method for Determination of Water Content of Soil and Rock by Microwave Oven Heating).
- Sieve Analysis (ASTM D422 – Test Method for Particle-size Analysis of Soils).
- Atterberg Limits (ASTM D4318 - Standard Test Methods for Liquid Limit, Plastic Limit, and Plasticity Index of Soils).
- Unconfined Compression Testing (ASTM D2166 – Standard Test Method for Unconfined Compressive Strength of Cohesive Soils).

Test results are summarized in **Table 2** with the exception of the unconfined compression test results, which are provided with the laboratory reports in **Appendix C.**

3 Site Conditions

The proposed HDD pipeline crossing traverses southwest to northeast across Lake Sakakawea approximately 1 mile northeast of the TGCBA. The physiographic regions where the proposed HDD pipeline crossing is located consist of the McKenzie Upland Unit, located southwest of the Missouri River and the Coteau Slope Unit, located northeast of the Missouri River. These units are part of the Great Plains and are characterized by rolling to hilly plains with both erosional and glacial landforms. The proposed HDD crossing is located within the historic Missouri River floodplain that was flooded with the construction of the Garrison Dam in 1956 to form Lake Sakakawea. This area is located in the central portion of the Williston Basin.

The surface geology in the area consists of thin layers of glacial deposits underlain by the Tertiary-Aged Sentinel Butte Formation and Bullion Creek Formation. The Sentinel Butte Formation consists of layers of silt, clay, sand, lignite, carbonaceous shale, and mudstone (Carlson, 1985). The Bullion Creek Formation underlies the Sentinel Butte Formation and consists of yellowish layers of silt, clay, and sand with interbedded sandstone, lignite, baked clay, and limestone (Bluemle, 1977). Both formations form rolling topography over broad areas and has been eroded to badlands near rivers.

Soil borings LB-1 through LB-3 generally consisted of well graded to poorly graded sand in the upper portion of the borings. The well graded to poorly graded sand was logged from the ground surface to a depth of approximately 25 feet below grade at LB-1 and from the ground surface to approximately 120 feet below grade at LB-2 and LB-3. Underlying the sand, silt, clay (lean and fat), weathered shale, and silty sand were logged. Underlying the sand, lignite (laminations to layers >20 feet thick) were logged throughout each boring to boring terminus. Saturated conditions were only encountered at boring LB-3, at 24.5 feet below grade.

4 Limitations

The data generated and conclusions and opinions provided are based on the scope of work performed. All work was conducted in a manner consistent with currently accepted geotechnical

engineering practices exercised by members of the profession practicing under similar conditions. No other warranty, expressed or implied, is made.

The samples collected and described in this report are representative of the subsurface conditions at the sampled locations and intervals, and therefore, do not necessarily reflect strata variations that may exist between sampled intervals and locations. If variations from the subsurface conditions described in this study are noted during additional investigations and/or construction, recommendations in this report must be re-evaluated.

GES is not responsible for the independent conclusions, opinions, or recommendations made by others based on the data presented in this report. Nor can GES warrant that this report will satisfy the dictates of or provide a legal defense in connection with an environmental law or regulation.

The results reported and any opinions reached by GES are for the benefit of the CCI & Associates and their client and unless agreed to by GES in writing, are not to be disclosed to or relied upon by any third party. The results and opinions set forth by GES in this report will be valid as of the date of the report.

				Coal: Lignite coal, black (2.5Y 2.5/1).							
			62	SM: SILTY SAND, fine grained, gray (2.5Y 5/1), moist, very dense.							
360	72	50 in.		CL-ML: SILTY CLAY, gray (2.5Y 5/1), moist, hard.							
			94	SM: SILTY SAND, fine grained, gray (2.5Y 5/1), moist, very dense.							
365	73	54 in.									
			67								
370	74	58 in.		EOB at 372 ft. Target depth reached.							

Notes:

Soil Lithologies based on field observations and laboratory analysis.

NA = not applicable; fbg. = feet below grade; in. = inches; ft. = feet; msl = mean sea level

Qp/Qu = unconfined compressive strength (tons / square foot); G = Gravel Content (%)

PL = Plastic Limit (%); LL = Liquid Limit (%); PI = Plasticity Index (%); S = Sand Content (%)

M/C = Silt or Clay Content (%); Blows = blows per 6 inches; RQD = rock quality index (%)

UNIFIED SOIL CLASSIFICATION SYSTEM

UNIFIED SOIL CLASSIFICATION AND SYMBOL CHART

COARSE-GRAINED SOILS (more than 50% of material is larger than No. 200 sieve size.)			
GRAVELS More than 50% of coarse fraction larger than No. 4 sieve size	Clean Gravels (Less than 5% fines)	GW	Well-graded gravels, gravel-sand mixtures, little or no fines
		GP	Poorly-graded gravels, gravel-sand mixtures, little or no fines
	Gravels with fines (More than 12% fines)	GM	Silty gravels, gravel-sand-silt mixtures
		GC	Clayey gravels, gravel-sand-clay mixtures
SANDS 50% or more of coarse fraction smaller than No. 4 sieve size	Clean Sands (Less than 5% fines)	SW	Well-graded sands, gravelly sands, little or no fines
		SP	Poorly graded sands, gravelly sands, little or no fines
	Sands with fines (More than 12% fines)	SM	Silty sands, sand-silt mixtures
		SC	Clayey sands, sand-clay mixtures
FINE-GRAINED SOILS (50% or more of material is smaller than No. 200 sieve size.)			
SILTS AND CLAYS Liquid limit less than 50%		ML	Inorganic silts and very fine sands, rock flour, silty of clayey fine sands or clayey silts with slight plasticity
		CL	Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, silty clays, lean clays
		OL	Organic silts and organic silty clays of low plasticity
SILTS AND CLAYS Liquid limit 50% or greater		MH	Inorganic silts, micaceous or diatomaceous fine sandy or silty soils, elastic silts
		CH	Inorganic clays of high plasticity, fat clays
		OH	Organic clays of medium to high plasticity, organic silts
HIGHLY ORGANIC SOILS		PT	Peat and other highly organic soils

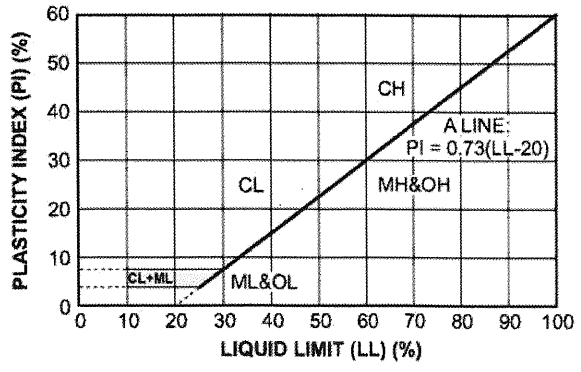
LABORATORY CLASSIFICATION CRITERIA

GW	$C_u = \frac{D_{60}}{D_{10}}$ greater than 4; $C_c = \frac{D_{30}}{D_{10} \times D_{60}}$ between 1 and 3	
GP	Not meeting all gradation requirements for GW	
GM	Atterberg limits below "A" line or P.I. less than 4	Above "A" line with P.I. between 4 and 7 are borderline cases requiring use of dual symbols
GC	Atterberg limits above "A" line with P.I. greater than 7	
SW	$C_u = \frac{D_{60}}{D_{10}}$ greater than 4; $C_c = \frac{D_{30}}{D_{10} \times D_{60}}$ between 1 and 3	
SP	Not meeting all gradation requirements for GW	
SM	Atterberg limits below "A" line or P.I. less than 4	Limits plotting in shaded zone with P.I. between 4 and 7 are borderline cases requiring use of dual symbols.
SC	Atterberg limits above "A" line with P.I. greater than 7	

Determine percentages of sand and gravel from grain-size curve. Depending on percentage of fines (fraction smaller than No. 200 sieve size), coarse-grained soils are classified as follows:

Less than 5 percent ..... GW, GP, SW, SP
More than 12 percent ..... GM, GC, SM, SC
5 to 12 percent ..... Borderline cases requiring dual symbols

PLASTICITY CHART



LABORATORY TEST RESULTS

Testing Scope

Laboratory testing was proposed to characterize soils index properties including Atterberg limits (liquid and plastic limits) and moisture content. Strength testing included unconfined compression testing.

Index Properties

Testing and classification of soils was performed in accordance with the Unified Soil Classification System as described in ASTM D 2487. Atterberg limits were performed according to ASTM D 4318. Moisture content was determined in accordance with ASTM D 4959 and D 4643. The dry density was determined with direct measurement procedures. Mechanical sieve analysis was done in accordance with ASTM D 422.

Strength Testing

The strength tests consisted of unconfined compression (QU) testing. The QU tests were conducted in accordance with ASTM D 2166.

1 Introduction

This report presents the results of the geotechnical investigation that was performed by Groundwater and Environmental Services, Inc. (GES) for the project known as the WBI North Bakken Expansion Project in western North Dakota. Specifically, this report covers the geotechnical exploration at 6 water-based soil borings located along the proposed horizontal directional drilling (HDD) pipeline project under Lake Sakakawea/Missouri River (**Figure 1**). The proposed pipeline alignment under Lake Sakakawea is located approximately 1 mile northeast of the Tobacco Garden Creek Recreation Area (TGCRA). The TGCRA is located approximately 23 miles northeast of Watford City, North Dakota.

Services for this investigation were performed in general accordance with the April 1, 2019 Services Contract by and between CCI and Associates, Inc. (CCI) and GES.

1.1 Project Location and Scope

The objective of this phase of the geotechnical investigation is to assist CCI with evaluating the subsurface conditions at 6 water-based boring locations (WB-4 through WB-9) located along the proposed HDD pipeline alignment in Lake Sakakawea.

The scope of work included the following:

- Prepare a site-specific health and safety plan for GES employees and subcontractors for the proposed geotechnical investigation activities.
- Coordinate field activities and communication with project team and CCI.
- Participate in a pre-construction meeting with the Garrison Project Natural Resource Office of the US Army Corp of Engineers (USACE), TGCRA stakeholders, GES project team and WBI Energy representatives.
- Arrange for an inspection of all equipment entering the Lake by the North Dakota Game and Fish Department (NDGFD). Provide proof that equipment has been cleaned of aquatic nuisance species, mud, standing water and aquatic vegetation.
- Arrange for utility clearance through North Dakota One Call.
- Install crane mat protection along shoreline at barge assembly area located within the TGCRA.
- Mobilize the drilling team (Interstate Drilling Services, LLP (IDS)) and assembly and deploy the barge.
- Advance 6 water-based soil borings and collect samples at designated locations
- Clean barge sections and boats during final demobilization.

- Contract laboratory tests on soil samples obtained from the 6 water-based soil borings to evaluate physical properties.
- Provide a written geotechnical report.

Photographs taking during the project are provided in **Appendix A.**

2 Methods

2.1 Soil Borings

GES contracted with IDS of Grand Forks, North Dakota, to assemble the barge and advance the 6 water-based soil borings (**Figure 1**). IDS used a Diedrich D-50 track-mounted drill rig to advance the borings and collect soil samples.

The barge was deployed at the TGCRA at a location adjacent to the north side of the low-water boat ramp. Prior to deployment, crane mats, consisting of wood timbers were placed on the beach from the gravel driveway to approximately 5 feet from the water line in order to allow the crane to drive down to the water's edge while protecting the beach area and bank from damage. A 6" wattle was placed along the lake shore between the crane pad and water for erosion protection. The crane pad location is provided on **Figure 2**.

The crane pad was installed on May 4, 2020 and the crane, barge sections, push boat, drilling rig, equipment and supplies were mobilized to the TGCRA on May 5th.

Prior to placing into the lake, the barge sections and push-boat were power-washed and inspected for aquatic nuisance species by the NDGFD, per the USACE Permit DACW45-3-17-8010. A copy of the inspection is provided in **Appendix B**. Once approved by the NDGFD, the barge sections were placed into the lake and assembled. The barge consisted of six 10'x40' sections. Loading of the drilling rig, equipment and supplies onto the barge was completed on May 6th.

The barge was directed over the boring locations with assistance from Erickson Contract Surveying, Inc. (ECS) of Sidney, Montana. The boring locations were located via boat using a handheld GPS system and then demarcated with a 14" diameter red buoy. The buoys were deployed approximately 50 feet from the proposed pipeline alignment. Once the barge reached the buoy, ECS personnel collected a second measurement of the actual boring location. The borehole locations and mudline elevations using North Dakota – North, State Plane datum (NAD 83, 2011) are provided in **Table 1**. The water elevation for Lake Sakakawea during the project was generally stable at approximately 1,841 feet (NAVD88).

Table 1 - Borehole Locations					
Bore Hole	Easting	Northing	Mudline Elevation (feet)	Latitude	Longitude
WB-4	1335963.13	420346.33	1,811.7	N48°07'23.30"	W103°05'25.93
WB-5	1336623.75	422154.16	1,811.7	N48°07'42.24"	W103°05'15.52
WB-6	1337159.16	424253.25	1,811.9	N48°08'02.38"	W103°05'10.74
WB-7	1337758.65	425801.28	1,811.7	N48°08'17.93"	W103°05'01.65
WB-8	1338402.89	428621.66	1,812.7	N48°08'45.61"	W103°04'53.93
WB-9	1338983.19	430083.96	1,813.0	N48°09'00.54"	W103°04'45.07

Borehole advancement began on May 6, 2020 and the last boring was completed on the evening of May 16, 2020. The drilling operation consisted of 2 crews each working 12-hour shifts on the 24-hour operation. Work stoppages, due to high wind conditions occurred on May 8th, May 9th, May 12th and May 13th.

A hollow-stem auger (HSA) was used to collect soil samples while boring through soft lake sediment. Once competent sediment was encountered; a closed loop, fluid rotary drilling method was used to advance the borings through the sediments. Rock coring drilling methodology was then used to reach each boring terminus.

All borings were advanced to a total depth of 300 feet below the lake mudline except for WB-7 which was advanced to 315 feet and WB-9 which was advanced to 310 feet below the mudline. Upon completion, each boring was sealed from the boring terminus to the lake mudline with a concrete/bentonite slurry through a tremie rod.

During the fluid rotary drilling process, the spent drilling fluid was captured and run through a Mud Puppy 255 that removed drill cutting sand and grit from the drilling fluid, allowing the drilling fluid to be returned to the drilling operation. This process greatly reduced overall waste generation during the drilling process. Drilling cuttings and sediment were containerized for disposal and transported to the Grand Forks Landfill (Permit IT-202) located at 2701 North 69th Street, Grand Forks, North Dakota.

During HSA and fluid rotary methodologies, 1.5-foot samples were collected at 5 foot intervals using a split-spoon sampler in accordance with American Society for Testing and Materials (ASTM) D1586 (*Standard Test Method for Standard Penetration Test [SPT] and Split-Barrel Sampling of Soils*) using a 2-inch diameter split-spoon sampler. During rock coring drilling methodology, samples were generally collected at 5-foot sample intervals continuously in accordance with ASTM D2113 (*Standard Practice for Rock Core Drilling and Sampling of Rock for Site Exploration*) using a using a NQ3 size, triple-tube core barrel with a diamond bit.

Soils were classified in the field by a GES field geologist using ASTM Visual-Manual procedures (ASTM D2488, *Standard Practice for Description and Identification of Soils [Visual-Manual Procedure]*). The field geologist also collected samples from the split-spoon sampler and rock core sampler for geotechnical laboratory testing.

The boring logs and standard boring classification guidelines are contained in **Appendix C**.

2.2 Laboratory Testing

GES contracted with Material Testing Services, LLC (MTS) of Minot, North Dakota to provide geotechnical laboratory testing and evaluation services to aid in classifying and evaluating the physical properties of the soil/rock samples. Soil/rock sample selection and laboratory test parameters were determined by CCI.

The laboratory testing included the following:

- Moisture Content (ASTM D4959 - Standard Test Method for Determination of Water Content of Soil by Direct Heating and D4643 - Standard Test Method for Determination of Water Content of Soil and Rock by Microwave Oven Heating).
- Sieve Analysis (ASTM D422 – Test Method for Particle-size Analysis of Soils).
- Atterberg Limits (ASTM D4318 - Standard Test Methods for Liquid Limit, Plastic Limit, and Plasticity Index of Soils).
- Unconfined Compression Testing (ASTM D2166 – Standard Test Method for Unconfined Compressive Strength of Cohesive Soils).

The laboratory data and reports are provided in **Appendix D.**

3 Site Conditions

The proposed HDD pipeline crossing traverses southwest to northeast across Lake Sakakawea approximately 1 mile northeast of the TGCRA. The physiographic regions where the proposed HDD pipeline crossing is located consist of the McKenzie Upland Unit, located south of the Missouri River and the Coteau Slope Unit, located north of the Missouri River. These units are part of the Great Plains and characterized by rolling to hilly plains with both erosional and glacial landforms. The proposed HDD crossing is located within the historic Missouri River floodplain that was flooded with the construction of the Garrison Dam in 1956 to form Lake Sakakawea. This area is located in the central portion of the Williston Basin.

The surface geology in the area consists of thin layers of glacial deposits underlain by the Paleocene-Aged Sentinel Butte Formation and the Bullion Creek Formation. The Sentinel Butte Formation consists of layers of silt, clay, sand, lignite, carbonaceous shale, and mudstone (Carlson, 1985). The Bullion Creek Formation underlies the Sentinel Butte Formation and consists of yellowish layers of silt, clay, and sand with interbedded sandstone, lignite, baked clay, and

limestone (Bluemle, 1977). Both formations are poorly lithified and form rolling topography over broad areas of Western North Dakota. The Sentinel Butte Formation outcrops along the north south shoreline of the Missouri River near WB-4 and both the Sentinel Butte and Bullion Creek Formations outcrop along the north shoreline of the Missouri River near WB-9 (Bluemle, 1977).

Soil borings WB-4 through WB-9 generally consist of silts and poorly graded sands and gravels in the upper portions of the borings, consistent with more recent alluvial deposits originating from the Missouri River. These alluvial deposits extend to approximately 45 feet below the mudline in borings WB-4 and WB-9, and to approximately 220 below the mudline at boring WB-7. Underlying the more recent alluvial deposits are deposits of the Sentinel Butte and Bullion Creek Formations.

4 Limitations

The data generated and conclusions and opinions provided are based on the scope of work performed. All work was conducted in a manner consistent with currently accepted geotechnical engineering practices exercised by members of the profession practicing under similar conditions. No other warranty, expressed or implied, is made.

The samples collected and described in this report are representative of the subsurface conditions at the sampled locations and intervals, and therefore, do not necessarily reflect strata variations that may exist between sampled intervals and locations. If variations from the subsurface conditions described in this study are noted during additional investigations and/or construction, recommendations in this report must be re-evaluated.

GES is not responsible for the independent conclusions, opinions, or recommendations made by others based on the data presented in this report. Nor can GES warrant that this report will satisfy the dictates of or provide a legal defense in connection with an environmental law or regulation.

The results reported and any opinions reached by GES are for the benefit of the CCI & Associates and their client and unless agreed to by GES in writing, are not to be disclosed to or relied upon by any third party. The results and opinions set forth by GES in this report will be valid as of the date of the report.

Appendix B – Aquatic Nuisance Species Inspection

ANS INSPECTION REPORT - For equipment brought into or to be used in North Dakota
NORTH DAKOTA GAME AND FISH DEPARTMENT
FISHERIES DIVISION

Company name: Interstate Drilling **Contact:** Mike Zak	**E-mail address:** mikez@interstatedrilling.com	**Phone number:** (701) 741-9951

Water body: Lake Sakakawea **Location:** Tobacco Gardens
Equipment inspected: 6 barge sections, 1 tugboat, various aquatic equipment

Where equipment was last used

Tugboat and four sections of barge last used on Missouri River near Boonville, Mo (taken out 4/20/20)
One barge section has been sitting since December of 2019 – Rock River, Rock Island, IL (taken out DEC 2019)
One barge section has been sitting since August of 2019 – Missouri River, Nebraska City, NE (take out AUG 2019)

ANS Precautions used prior to equipment entering North Dakota

All barge sections were pressure washed with hot water prior to entering North Dakota. Additionally, barge sections and tugboat were dried for 2 weeks to 8 months.

Actual physical and visual ANS inspection

Barge section 1 – few very dry byssal threads found. No limpets or ZM. Cleared for launch.
Barge section 2 – numerous dried byssal threads and 2 dead zebra mussels found, all very dry. Required additional cleaning and inspection.
Barge section 3 – some byssal threads. No mussels or limpets. Cleared for launch.
Barge section 4 slanted – very few byssal threads. Cleared for launch.
Barge section 5 – no attached organism and very few dry byssal threads. Cleared for launch.
Barge section 6 – no attached organic material. Cleared for launch.
Tugboat – no byssal threads or mussels found on the outside of the boat. Required additional cleaning because it was not washed before entering North Dakota. Inside of tugboat does not take on water. No standing water or organics found inside, so did not require additional cleaning or disinfection inside.

Additional comments or notes:

One section of barge and the tugboat were power washed under supervision and were re-inspected. These were cleared to be put into Sakakawea.
Zebra mussels observed had desiccated organs, indicating that they were not alive. It is likely that the pressure washing in Missouri utilized hot water or the two week plus drying period allowed the mussels to die.
Crane did not get put in water – no inspection required.

Status:	**NDGF representative:**	**Date:**
Approved	Ben Holen, ANS Coordinator	5/5/2020

Barge section 2 and zebra mussel that was discovered on it.

LABORATORY TEST RESULTS

Testing Scope

Laboratory testing was proposed to characterize soils index properties including Atterberg limits (liquid and plastic limits) and moisture content. Strength testing included unconfined compression testing.

Index Properties

Testing and classification of soils was performed in accordance with the Unified Soil Classification System as described in ASTM D 2487. Atterberg limits were performed according to ASTM D 4318. Moisture content was determined in accordance with ASTM D 4959 and D 4643. The dry density was determined with direct measurement procedures. Mechanical sieve analysis was done in accordance with ASTM D 422.

Strength Testing

The strength tests consisted of unconfined compression (QU) testing. The QU tests were conducted in accordance with ASTM D 2166.

UNIFIED SOIL CLASSIFICATION SYSTEM

UNIFIED SOIL CLASSIFICATION AND SYMBOL CHART

COARSE-GRAINED SOILS (more than 50% of material is larger than No. 200 sieve size.)			
GRAVELS More than 50% of coarse fraction larger than No. 4 sieve size	Clean Gravels (Less than 5% fines)	GW	Well-graded gravels, gravel-sand mixtures, little or no fines
		GP	Poorly-graded gravels, gravel-sand mixtures, little or no fines
	Gravels with fines (More than 12% fines)	GM	Silty gravels, gravel-sand-silt mixtures
		GC	Clayey gravels, gravel-sand-clay mixtures
SANDS 50% or more of coarse fraction smaller than No. 4 sieve size	Clean Sands (Less than 5% fines)	SW	Well-graded sands, gravelly sands, little or no fines
		SP	Poorly graded sands, gravelly sands, little or no fines
	Sands with fines (More than 12% fines)	SM	Silty sands, sand-silt mixtures
		SC	Clayey sands, sand-clay mixtures
FINE-GRAINED SOILS (50% or more of material is smaller than No. 200 sieve size.)			
SILTS AND CLAYS Liquid limit less than 50%		ML	Inorganic silts and very fine sands, rock flour, silty of clayey fine sands or clayey silts with slight plasticity
		CL	Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, silty clays, lean clays
		OL	Organic silts and organic silty clays of low plasticity
SILTS AND CLAYS Liquid limit 50% or greater		MH	Inorganic silts, micaceous or diatomaceous fine sandy or silty soils, elastic silts
		CH	Inorganic clays of high plasticity, fat clays
		OH	Organic clays of medium to high plasticity, organic silts
HIGHLY ORGANIC SOILS		PT	Peat and other highly organic soils

LABORATORY CLASSIFICATION CRITERIA

GW	$C_u = \frac{D_{60}}{D_{10}}$ greater than 4; $C_c = \frac{D_{30}}{D_{10} \times D_{60}}$ between 1 and 3	
GP	Not meeting all gradation requirements for GW	
GM	Atterberg limits below "A" line or P.I. less than 4	Above "A" line with P.I. between 4 and 7 are borderline cases requiring use of dual symbols
GC	Atterberg limits above "A" line with P.I. greater than 7	
SW	$C_u = \frac{D_{60}}{D_{10}}$ greater than 4; $C_c = \frac{D_{30}}{D_{10} \times D_{60}}$ between 1 and 3	
SP	Not meeting all gradation requirements for GW	
SM	Atterberg limits below "A" line or P.I. less than 4	Limits plotting in shaded zone with P.I. between 4 and 7 are borderline cases requiring use of dual symbols.
SC	Atterberg limits above "A" line with P.I. greater than 7	

Determine percentages of sand and gravel from grain-size curve. Depending on percentage of fines (fraction smaller than No. 200 sieve size), coarse-grained soils are classified as follows:

Less than 5 percent ..... GW, GP, SW, SP
More than 12 percent ..... GM, GC, SM, SC
5 to 12 percent ..... Borderline cases requiring dual symbols

LOG OF CONVERSATION

Ms. Thornton called the North Dakota State Water Commission to speak with Gerald Heiser regarding the North Bakken Expansion Project.

Ms. Thornton called to confirm that Mr. Heiser received the updated Soverign Land Permit Application that was submitted last week. Mr. Heiser indiciated that yes the files had been received. Ms. Thornton then asked if there were any updates on the potential need for a scour analysis. Mr. Heiser noted that no decision had been made yet, and that we would raise the subject again with his supervisor for discussion this week. Ms. Thornton ask if the permit review timeframe was still 90 days, and Mr. Heiser confirmed that to be true. Ms. Thornton thanked Mr. Heiser and asked that he reach out if there are any question regarding the permit application.

Subject: North Bakken

Hi Andy.

Would you be available for a call today or tomorrow to discuss the North Bakken project? We have found or relocated a lot of stone feature sites in areas near Tioga resulting in challenging routing for the new pipeline. WBI Energy is looking at the option of installing the new pipeline within an existing corridor, such that construction would be limited to the area disturbed by the previous pipeline project. While we're still working to nail down details, this might involve construction across sites or areas immediately adjacent to sites with no buffer. I'm hoping to chat with you about what we may need to do to assess eligibility/effect on sites in this scenario.

MEETING NOTES

LOG OF VIRTUAL MEETING

MEETING ATTENDEES:

Andrew Clark (North Dakota State Archaeologist), Dave Linn (WBI Energy Transmission, Inc.), Jill Linn (WBI Energy Transmission, Inc.), Pat Robblee (ERM), and Kevin Malloy (ERM)

DATE:	TIME OF CONVERSATION:
08/14/2020	2:00 cst

RE:

WBI North Bakken Expansion Project 2020

PREPARED BY:

Kevin Malloy

LOG OF CONVERSATION:

- Kevin Malloy (ERM) welcomed everyone to the meeting.
- Pat Robblee (ERM) described the challenges of routing the Line Section 25 Loop north of Tioga given the many constraints in this area, including a high density of prehistoric stone feature sites (previously recorded and newly recorded), numerous existing pipelines, and several large wetlands. While WBI Energy continues to investigate alternate routes in this area, Pat explained that it may not be feasible to avoid all of the prehistoric stone feature sites with a buffer of 50 ft (i.e., 50 ft between the site boundaries and the nearest construction workspace).
- Pat explained that WBI Energy is considering as a possible alternative a conceptual design where the new pipeline would be routed adjacent to an existing pipeline, with the construction workspace for the new pipeline (about 75-ft-wide) wholly sited within the construction corridor for the existing pipeline. The conceptual design alternative could allow WBI Energy to avoid the prehistoric stone feature sites by limiting new construction to previously disturbed areas, but not necessarily with a 50 ft buffer between workspace and the sites. Mr. Robblee asked Mr. Clark if it would be possible get to a “no adverse effect” determination for sites within 50 ft if construction is confined to a previously disturbed corridor?
- Andy Clark (SHSND) said that a “no adverse effect” determination under the alternative conceptual design would be possible, but the SHSND would want good documentation of the extent of previous disturbance based on both air photo interpretation and on-the-the-ground verification and mapping. Consultation with the tribes would also be required to get their input on the avoidance measures for the sites. Pat noted that tribal cultural specialists from several tribes have been participating in fieldwork for the Project and either have or would be visiting sites along any route proposed for the Project in the area being discussed.
- Andy said that understanding the nature of the sites will be important in assessing Project effects. He said that the SHSND has allowed work on non-contributing portions of historic properties or sites being treated as historic properties. A 50 ft buffer between sites and

construction workspace would generally result in a finding of “no historic properties affected”. For sites within 50 ft of workspace, or situations where the pipeline would cross non-contributing portions of historic properties, a finding of “no adverse effect” would be possible.

- If WBI Energy pursues the alternative conceptual design, Andy said It would be good to describe the alternatives considered and explain why they are not feasible. From a reviewer standpoint, Andy said it is often difficult to understand why a particular route is being pursued without understanding what other options have been considered.
- Andy, Pat, and Kevin discussed site forms for archaeological resources and cultural heritage sites. Andy said that findings or interpretations based solely on tribal cultural knowledge should not be included on archaeological site forms. The ethnographic context for findings should be provided on cultural heritage forms. Andy also said the Project will need to address impacts on both archaeological and cultural heritage sites.
- The meeting was concluded and Dr. Malloy thanked everyone for attending.

LOG OF CONVERSATION

Jena Orlowski and I called Dr. Andrew Clark, ND State Archaeologist, and Amy Bleier with the SHSND, to review the content requirements for archaeological site forms and cultural heritage site forms. We also discussed the upcoming submission of an updated Class III archaeology report. The results of the archaeological survey and documentation of cultural heritage sites should be presented in separate reports. Also, separate avoidance plans would need to be prepared for archaeological sites and cultural heritage sites. Finally, we discussed upcoming work at 32WI976 including testing methodologies.

LOG OF CONVERSATION

I called Andy Clark to discuss reporting requirements for archaeological resources and cultural heritage sites. Andy said that documentation of cultural heritage sites should be kept separate from the documentation of archaeological sites and presented in separate reports. He said this is because of the different nature of each type of resource but also because the archaeological surveys and cultural heritage documentation have been managed by two different companies. Andy also said that separate avoidance plans for archaeological resources and cultural heritage sites should be provided for agency review. Any differences in recommendations for site avoidance for associated archaeological and cultural heritage sites would need to be reconciled.

For archaeological sites that are eligible or unevaluated, Andy confirmed that a 50 ft buffer between site boundaries and construction workspace with a commitment to fence and monitor would typically result in a “no effect” finding for those resources.

LOG OF CONVERSATION

I called North Dakota State Archaeologist, Andy Clark, to discuss the methodology for unit excavation at 32WI976, particularly with regard to feature documentation. We agreed that the testing should aim to be as minimally invasive as possible. As a general rule, test units should not be expanded to expose an entire feature Instead, test units only need to be expanded to identify the edge of a feature, which should provide enough information to estimate the size of the feature.

Subject: WBI Energy Transmission, Inc.
North Bakken Expansion Project – Class III Survey Reports 2020 Field Season
McKenzie, Williams, Burke, and Mountrail Counties, North Dakota
ND SHPO Ref.: 19-5593

Dear Dr. Clark:

Please reference WBI Energy Transmission, Inc.'s (WBI Energy's) previous correspondence regarding the above referenced project. WBI Energy proposes to construct and operate the North Bakken Expansion Project (Project) in McKenzie, Williams, Burke, and Mountrail Counties, North Dakota.

The Project is regulated by the Federal Energy Regulatory Commission (FERC) under Section 7(c) of the Natural Gas Act. Under the Energy Policy Act of 2005, FERC is the lead agency for coordinating federal authorizations and complying with the National Environmental Policy Act on natural gas pipeline projects subject to its jurisdiction. FERC similarly is the lead federal agency for complying with Section 106 of the National Historic Preservation Act (NHPA) on natural gas pipeline projects under its jurisdiction. In accordance with 36 CFR 800.2(c)(4), WBI Energy is assisting the FERC in meeting its obligations under Section 106 of the NHPA by coordinating with agencies and tribes and conducting surveys to identify historic properties that may be affected by the Project.

Enclosed for your review please find Class III survey reports for the archaeological and historic structures surveys that were conducted during the 2019 and 2020 field seasons. The archaeological report includes the results provided in the original Class III report and addresses comments that were provided by the State Historical Society of North Dakota, Bureau of Land Management, U.S. Army Corps of Engineers, and the U.S. Forest Service. The attached table summarizes our response to those comments and provides the location of the relevant revisions or clarifications. A report on geomorphological investigations is also included in this submittal.

WBI Energy would appreciate your comments on the attached reports. If you have any questions or comments on the Project or the reports, please contact me at 612-840-8976 or pat.robblee@erm.com, or Dr. Kevin Malloy at 906-285-0361 or kevin.malloy@erm.com. Please direct written correspondence to Dr. Malloy's attention at:

Environmental Resources Management

Attachment: Table summarizing agency comments on the original Class III archaeology report

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Comments from the State Historical Society of North Dakota		
General comments:		
o Provide more background information on sites with previous work. Focus on methods and reasoning for previous eligibility recommendation.	Additional information on previous investigations has been added to site descriptions, as applicable.	Sections 5.3 through 5.7
o Map symbology has item named “Shovel test – No Dig”. Are these shovel probes that were planned, but not excavated for some reason? If so provide explanation.	These are planned but unexcavated shovel tests. Site descriptions have been updated, as applicable, to explain why some planned shovel tests were not excavated. Typical reasons for not excavating shovel tests include the presence of buried utilities (documented through One-Call markings) or slope.	Sections 5.3 through 5.5
Avoidance, 50 ft buffer minimum, fence, and monitor:		
o Private land: 32BK277, 32BK279, 32BK280, 32BK282, 32MZ3308, 32MZ3309, 32MZ3310, 32MZ3311, 32MZ3325, 32MZ3327, 32WI1494, 32WI1630, 32WI2144, 32WI2388, 32WI2389, 32WI2391, 32WI2392, 32WI2393, 32WI2394, 32WI2398, 32WI2406, 32WI2408.	Each of these sites is avoided with a minimum 50 ft buffer. Additionally, for sites located between 50 and 100 ft of Project workspace, WBI Energy commits to fencing and monitoring at these locations.	Section 5.3
o US Forest Service Sites: 32MZ3301, 32MZ3314, 32MZ3315, 32MZ3319, 32MZ3320, 32MZ3322, 32MZ3324.	Each of these sites is avoided with a minimum 50 ft buffer. Additionally, for sites located between 50 and 100 ft of Project workspace, WBI Energy commits to fencing and monitoring at these locations.	Section 5.5
Formally evaluate with site delineation and at least one 1x1 m TU. Submit evaluation plan prior to fieldwork:		
o Private Land: 32BK278, 32MZ3302, 32MZ3306, 32MZ3307, 32MZ3318, 32MZ3323, 32MZ3326, 32MZ3328, 32MZ3329, 32MZ3331, 32WI2390, 32WI2405, 32WI2407, 32WI2409, 32WI2410.	Additional testing (shovel testing and/or the excavation of at least one, 1 x 1 m test unit) was completed at each of these sites in accordance with a testing plan approved by the SHSND. Testing at sites 32WI2390 and 32MZ3328 was suspended following the identification of stone features at these sites; however, the pipeline route has been adjusted to avoid these sites with a minimum 50-ft buffer.	Section 5.3
o US Forest Service Site: 32MZ2346.	While ERM planned to conduct additional testing at this site, the pipeline route was modified prior to this work such that the site is now avoided by the Project with a buffer greater than 100 ft.	Section 5.5
Isolated finds:		
o Discuss subsurface potential on all IFs on a case-by-case basis. If the finds are in a good depositional context, STPs may be necessary to show that these are truly isolates. Minimal site recording may be enough to get a site number for database purposes, but more information is needed to verify that these are truly part of a category that can be written-off as not eligible.	Individual descriptions of isolated finds have been added to the text, including the results of shovel testing or an explanation for why shovel tests were not excavated.	Section 5.7

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Site-by-site comments, private land:		
o 32BK168 – Expand reasoning for Not Eligible Determination both previously and now. Newly recorded site boundary included previously unidentified features. Perhaps site should be unevaluated. Consider formal evaluation and provide updated management recommendations.	ERM conducted site testing at 32BK168 in 2020. Evidence of intact cultural deposits and features was identified during testing and the site is now recommended as eligible for listing in the NRHP. The pipeline route has been modified to avoid this site with a buffer of 57 ft.	Section 5.3
o 32MZ3323 – Discussion mentions "Better Examples" of homesteads. Provide examples.	The description for 32MZ3323 has been updated to incorporate the results of additional testing (shovel testing and the excavation of a 1 x 1 m test unit) in the updated Class III report.	Section 5.3
o 32WI1495 – Actual well shown in Figure 5.3-81 may be visible in figure 5.3-80. Is this location impacted by project? Consider site lead.	The location of the well (which is no longer extant) is discussed in the updated Class III report in conjunction with 32WI1495. ERM has submitted a site lead form for this resource. The suggested boundary of the site lead is 19 ft from Project workspace. The actual location of the well is about 235 ft from Project workspace.	Section 5.3
o 32WI2404 – How is this identified as prehistoric? Could it be a result of natural glacial and/or historic or modern field clearing? Provide evidence. Fence and monitor as necessary.	The interpretation of the feature at 32WI2404 as prehistoric is conservative and based on best professional judgement. Tribal cultural specialists who visited the site with ERM concurred with this interpretation.	Section 5.3
o 32WI2408 – Workspace is extremely close to possible graves. Is the planned route fixed?	The pipeline route has been modified to avoid this site with a buffer of 213 ft.	Section 5.3
Site-by-site comments, US Army Corps of Engineers land:		
o 32MZ976 – Drilling under site is not avoidance as leaks and emergency repairs do consider cultural resources. Formal testing or horizontal avoidance is necessary.	The trajectory of the HDD will be 160 to 180 ft below ground surface where it passes beneath 32WI976. The pipeline will carry gas, not a liquid; the gas would migrate to the surface and dissipate into the air in the event of a leak. Given the depth of the HDD installation, daylighting of the pipeline for repair would not be feasible. If repair is required in the future, the most likely course of action would be to re-install a new segment via HDD, which would require federal authorizations, thereby triggering review of the action under Section 106 of the NHPA. A description of the HDD method has been added to the description of 32WI976 in Section 5.4 of the report. Additional testing at the site is pending and scheduled to be completed this fall. The results will be discussed in an addendum report.	Section 5.4
o 32MZ976 – Show bore location and HDD line on map	A figure showing the HDD alignment with entry and exit points has been added to the description of this site as has a construction alignment sheet. The alignment sheet depicts the HDD in plan and profile.	Section 5.4

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
o 32MZ976 – Clarify and provide more evidence for geomorphological hypothesis of A horizon being related to flood deposits. Typically, A horizons show stability rather than accretional or erosional events. Provide more information on why artifacts are interpreted as disturbed rather than in primary context.	The text in the updated Class III report has been updated to address this comment. As noted above, additional testing is planned to occur at 32WI976 this fall, which will provide additional information on the soils present at the site.	Section 5.4
o 32MZ976 – Did cut bank provide additional information on buried soils? Were artifacts identified in cut bank?	The cut bank was examined during the initial survey. As noted above, additional testing is planned to occur at the site this fall with results to be discussed in an addendum report.	Section 5.4
o 32WI976 – Given size and shape of site, additional TUs recommended.		
Comments from the Bureau of Land Management		
o The recommended protection/avoidance measures for unevaluated and eligible archaeological sites in the Class III report are inadequate, particularly regarding stone feature sites. The usual avoidance distance requested/required by the BLM is 100 feet. More than 100 feet is preferred for stone feature sites. Revise protection/avoidance measures buffers for archaeological sites.	WBI Energy has routed the pipeline to avoid unevaluated and eligible sites with a minimum buffer of 50 ft as directed by the SHSND.	Sections 5.3 through 5.5
o Why were indirect effects to archaeological sites not considered? Setting is an important aspect of integrity for stone feature sites. There are numerous archaeological sites within and near the survey corridor that should be analyzed for indirect effects. Revise the report to address indirect effects to archaeological sites.	The report has been updated to include an assessment of physical and non-physical impacts on unevaluated and eligible sites.	Sections 4 and 5.5 through 5.5
o WBI Energy needs to develop a cultural resource monitoring plan for construction.	WBI Energy commits to preparing a monitoring plan for construction.	Sections 5.3 through 5.5
o Update site form for all sites, site leads, and isolated finds regardless of whether they were relocated. Even if a cultural resource could not be relocated, that is still valuable information for the next project/site visit.	Site form updates have been submitted for all sites, isolated finds, and site leads discussed in the updated Class III report	N/A
o WBI Energy should make additional efforts to involve tribes in upcoming 2020 fieldwork and field reviews.	As discussed in more detail in Section 4 of the updated Class III report, WBI Energy retained Beaver Creek Archaeology to coordinate tribal participation in fieldwork in 2020. BCA worked with tribes to document sites as cultural heritage resources. The results of that work will be presented in a separate report. Information on tribal participation in the surveys also is provided in Sections 4 and 5.3 through 5.5 of ERM's updated Class III report	Sections 4 and 5.3 through 5.5

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Comments from U.S. Army Corps of Engineers		
o In section 5.4.2, remove figures for 32MZ0598 and move to the previous section.	This comment is addressed in the updated Class III report	Section 5.4
o Figure 5.4-5: Map of Site 32WI976, provide contour lines on this map to show the slope. This information would help to explain why the shovel testing pattern appears the way it does.	Contour lines are provided on Figure 5.4-9 in the updated Class III report.	Section 5.4
o ERM, on behalf of WBI [Energy], identified a second concentration of artifacts in the western side of site 32WI0976 after they started excavating the test unit. Some additional testing is needed here as USACE cannot agree with the recommended determination for this site given the data presented in this report.	Additional testing will be completed at this site in the fall of 2020 with the results presented in an addendum report.	Section 5.4
o USACE recommends that WBI [Energy] conduct a remote sensing evaluation (gradiometer or conductivity) at site 32WI0976. This would be the best way to produce measurable data regarding the presence/absence of subsurface features at the site.	A remote sensing survey of the site was completed in the summer of 2020. The results of the survey were used to prepare a testing plan for 32WI976. Additional testing at the site will occur this fall with the results presented in an addendum report.	Section 5.4
Comments from the U.S. Forest Service		
o The map showing previously recorded cultural resources within a one-mile radius is only included in the overall Class III and not in the Forest Service stand-alone report. Please include this in the stand-alone Forest Service report.	This comment is no longer applicable. Survey results for USFS lands are included in the updated Class III inventory report in Section 5.5.	N/A
o Figure 1.1-2 shows the Forest Service surface and differentiates between the survey corridor and the survey corridor on Forest Service surface; however, the survey corridor on Forest Service surface and the actual Forest Service surface displayed don't match.	This comment is no longer applicable. Survey results for USFS lands are included in the updated Class III inventory report in Section 5.5.	N/A
o Sites 32MZ2347 (Historical Archaeological) and 32MZ3278 (Cairn) are located immediately adjacent to the survey corridor but are not discussed. Please discuss.	Based on route modifications, 32MZ3278 was visited in 2020 and the site boundary expanded based on the findings. A discussion of the site is provided in the updated Class III report. 32MZ2347 is outside the inventory corridor for the Project; however, we have included a discussion of this site in the Class III inventory report.	Section 5.5
o Site 32MZ145 site form update does not appear to have been performed. Why? Was an attempt made to actually relocate the site? Also, according to the site form, a THPO representative requested avoidance in 2013. More work on this site is probably needed.	When 32MZ145 was first recorded in 1979, it was characterized as two stone cairns. Subsequent investigations described the site as consisting of a single historic rock clearing pile on the west side of Highway 1806, noting that the second pile was likely destroyed by construction of the highway. ERM's survey in 2019 was limited to the east side of Highway 1806, which explains why we did not relocate the site at that time. In 2020, ERM conducted additional survey on USFS lands, examining a corridor on the west side of Highway 1806. 32MZ145 was relocated as a result of this work. The site is discussed in the updated Class III report. Tribal cultural specialists who accompanied ERM during the 2020 field investigation concurred that 32MZ145 is historic rock clearing pile.	Section 5.5

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
o Site 32MZ2346 and 32MZ144: it is very improbable and therefore suspicious that there are zero artifacts and one artifact respectively at sites with historic dumps.	Sites 32MZ2346 and 32MZ144 are both previously recorded historic sites which ERM revisited and recorded during the survey for the Project. Cultural material was observed at both sites as described in the updated Class III report. ERM expanded the boundaries of 32MZ2346 to encompass two previously unreported features at the site. One artifact–a commemorative coin–was collected from 32MZ2346 because of its uniqueness. No artifacts were collected from 32MZ144. Expanded descriptions of both sites are provided in the updated Class III report.	Section 5.5
o Additional survey is shown as needed near site 32MZ3278 on the maps in the overall Class III report but not in the Forest Service stand-alone report. Please include this in the stand-alone Forest Service report.	Additional survey was completed in 2020 on USFS lands in the vicinity of 32MZ3278, which was relocated. A description of the site is provided in the updated Class III report.	Section 5.5
o The recommended avoidance and fencing measures are inadequate, especially for stone feature sites.	All stone feature sites have been avoided with a minimum buffet of 50 ft. Additionally, for sites between 50 and 100 ft of Project workspace WBI Energy commits to fencing and monitoring the sites during construction. WBI Energy will provide a monitoring plan for agency review.	Section 5.5
o A monitoring plan is needed.	WBI Energy commits to providing a construction monitoring plan as discussed in the updated Class III report.	
o Updates should have been conducted for all sites, site leads, and IFs [isolated finds] regardless of whether or not they were relocated.	Site form updates have been submitted for all applicable sites, isolated finds, and site leads discussed in the report	N/A
o The discussion of site leads during fieldwork is inadequate.	Site leads are discussed in Section 5.6 of the updated Class III report.	Section 5.6
o Provide specific distances between site boundaries and the edge of the workspace.	Distances between sites and Project workspaces have been added to summary tables and site descriptions throughout the updated Class III report.	Sections 5.3 through 5.5
o Provide a map of shovel testing performed outside of site boundaries. The report explains the testing strategy during survey but never discusses or shows specifics except within site boundaries.	The route maps provided as Appendix B depict survey methodology in addition to survey coverage and results.	Appendix B
o Identify the level of tribal involvement in the survey.	Tribal participation in field surveys is discussed in Sections 4 and 5.3 through 5.5 of the updated Class III report.	Sections 4 and 5.3 through 5.5
o Discuss whether indirect effects to archaeological sites were considered.	For unevaluated sites, we have added an assessment of non-physical impacts on setting.	Sections 5.3 through 5.5

Subject: WBI Energy Transmission, Inc.
North Bakken Expansion Project – Class III Survey Reports 2020 Field Season
McKenzie, Williams, Burke, and Mountrail Counties, North Dakota
ND SHPO Ref.: 19-5593

Dear Director Swenson:

Please reference WBI Energy Transmission, Inc.'s (WBI Energy's) previous correspondence regarding the above referenced project. WBI Energy proposes to construct and operate the North Bakken Expansion Project (Project) in McKenzie, Williams, Burke, and Mountrail Counties, North Dakota.

The Project is regulated by the Federal Energy Regulatory Commission (FERC) under Section 7(c) of the Natural Gas Act. Under the Energy Policy Act of 2005, FERC is the lead agency for coordinating federal authorizations and complying with the National Environmental Policy Act on natural gas pipeline projects subject to its jurisdiction. FERC similarly is the lead federal agency for complying with Section 106 of the National Historic Preservation Act (NHPA) on natural gas pipeline projects under its jurisdiction. In accordance with 36 CFR 800.2(c)(4), WBI Energy is assisting the FERC in meeting its obligations under Section 106 of the NHPA by coordinating with agencies and tribes and conducting surveys to identify historic properties that may be affected by the Project.

Enclosed for your review please find Class III survey reports for the archaeological and historic structures surveys that were conducted during the 2019 and 2020 field seasons. The archaeological report includes the results provided in the original Class III report and addresses comments that were provided by the State Historical Society of North Dakota, Bureau of Land Management, U.S. Army Corps of Engineers, and the U.S. Forest Service. The attached table summarizes our response to those comments and provides the location of the relevant revisions or clarifications. A report on geomorphological investigations is also included in this submittal.

WBI Energy would appreciate your comments on the attached reports. If you have any questions or comments on the Project or the reports, please contact me at 612-840-8976 or pat.robblee@erm.com, or Dr. Kevin Malloy at 906-285-0361 or kevin.malloy@erm.com. Please direct written correspondence to Dr. Malloy's attention at:

Attachment: Table summarizing agency comments on the original Class III archaeology report

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Comments from the State Historical Society of North Dakota		
General comments:		
o Provide more background information on sites with previous work. Focus on methods and reasoning for previous eligibility recommendation.	Additional information on previous investigations has been added to site descriptions, as applicable.	Sections 5.3 through 5.7
o Map symbology has item named “Shovel test – No Dig”. Are these shovel probes that were planned, but not excavated for some reason? If so provide explanation.	These are planned but unexcavated shovel tests. Site descriptions have been updated, as applicable, to explain why some planned shovel tests were not excavated. Typical reasons for not excavating shovel tests include the presence of buried utilities (documented through One-Call markings) or slope.	Sections 5.3 through 5.5
Avoidance, 50 ft buffer minimum, fence, and monitor:		
o Private land: 32BK277, 32BK279, 32BK280, 32BK282, 32MZ3308, 32MZ3309, 32MZ3310, 32MZ3311, 32MZ3325, 32MZ3327, 32WI1494, 32WI1630, 32WI2144, 32WI2388, 32WI2389, 32WI2391, 32WI2392, 32WI2393, 32WI2394, 32WI2398, 32WI2406, 32WI2408.	Each of these sites is avoided with a minimum 50 ft buffer. Additionally, for sites located between 50 and 100 ft of Project workspace, WBI Energy commits to fencing and monitoring at these locations.	Section 5.3
o US Forest Service Sites: 32MZ3301, 32MZ3314, 32MZ3315, 32MZ3319, 32MZ3320, 32MZ3322, 32MZ3324.	Each of these sites is avoided with a minimum 50 ft buffer. Additionally, for sites located between 50 and 100 ft of Project workspace, WBI Energy commits to fencing and monitoring at these locations.	Section 5.5
Formally evaluate with site delineation and at least one 1x1 m TU. Submit evaluation plan prior to fieldwork:		
o Private Land: 32BK278, 32MZ3302, 32MZ3306, 32MZ3307, 32MZ3318, 32MZ3323, 32MZ3326, 32MZ3328, 32MZ3329, 32MZ3331, 32WI2390, 32WI2405, 32WI2407, 32WI2409, 32WI2410.	Additional testing (shovel testing and/or the excavation of at least one, 1 x 1 m test unit) was completed at each of these sites in accordance with a testing plan approved by the SHSND. Testing at sites 32WI2390 and 32MZ3328 was suspended following the identification of stone features at these sites; however, the pipeline route has been adjusted to avoid these sites with a minimum 50-ft buffer.	Section 5.3
o US Forest Service Site: 32MZ2346.	While ERM planned to conduct additional testing at this site, the pipeline route was modified prior to this work such that the site is now avoided by the Project with a buffer greater than 100 ft.	Section 5.5
Isolated finds:		
o Discuss subsurface potential on all IFs on a case-by-case basis. If the finds are in a good depositional context, STPs may be necessary to show that these are truly isolates. Minimal site recording may be enough to get a site number for database purposes, but more information is needed to verify that these are truly part of a category that can be written-off as not eligible.	Individual descriptions of isolated finds have been added to the text, including the results of shovel testing or an explanation for why shovel tests were not excavated.	Section 5.7

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Site-by-site comments, private land:		
o 32BK168 – Expand reasoning for Not Eligible Determination both previously and now. Newly recorded site boundary included previously unidentified features. Perhaps site should be unevaluated. Consider formal evaluation and provide updated management recommendations.	ERM conducted site testing at 32BK168 in 2020. Evidence of intact cultural deposits and features was identified during testing and the site is now recommended as eligible for listing in the NRHP. The pipeline route has been modified to avoid this site with a buffer of 57 ft.	Section 5.3
o 32MZ3323 – Discussion mentions "Better Examples" of homesteads. Provide examples.	The description for 32MZ3323 has been updated to incorporate the results of additional testing (shovel testing and the excavation of a 1 x 1 m test unit) in the updated Class III report.	Section 5.3
o 32WI1495 – Actual well shown in Figure 5.3-81 may be visible in figure 5.3-80. Is this location impacted by project? Consider site lead.	The location of the well (which is no longer extant) is discussed in the updated Class III report in conjunction with 32WI1495. ERM has submitted a site lead form for this resource. The suggested boundary of the site lead is 19 ft from Project workspace. The actual location of the well is about 235 ft from Project workspace.	Section 5.3
o 32WI2404 – How is this identified as prehistoric? Could it be a result of natural glacial and/or historic or modern field clearing? Provide evidence. Fence and monitor as necessary.	The interpretation of the feature at 32WI2404 as prehistoric is conservative and based on best professional judgement. Tribal cultural specialists who visited the site with ERM concurred with this interpretation.	Section 5.3
o 32WI2408 – Workspace is extremely close to possible graves. Is the planned route fixed?	The pipeline route has been modified to avoid this site with a buffer of 213 ft.	Section 5.3
Site-by-site comments, US Army Corps of Engineers land:		
o 32MZ976 – Drilling under site is not avoidance as leaks and emergency repairs do consider cultural resources. Formal testing or horizontal avoidance is necessary.	The trajectory of the HDD will be 160 to 180 ft below ground surface where it passes beneath 32WI976. The pipeline will carry gas, not a liquid; the gas would migrate to the surface and dissipate into the air in the event of a leak. Given the depth of the HDD installation, daylighting of the pipeline for repair would not be feasible. If repair is required in the future, the most likely course of action would be to re-install a new segment via HDD, which would require federal authorizations, thereby triggering review of the action under Section 106 of the NHPA. A description of the HDD method has been added to the description of 32WI976 in Section 5.4 of the report. Additional testing at the site is pending and scheduled to be completed this fall. The results will be discussed in an addendum report.	Section 5.4
o 32MZ976 – Show bore location and HDD line on map	A figure showing the HDD alignment with entry and exit points has been added to the description of this site as has a construction alignment sheet. The alignment sheet depicts the HDD in plan and profile.	Section 5.4

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
o 32MZ976 – Clarify and provide more evidence for geomorphological hypothesis of A horizon being related to flood deposits. Typically, A horizons show stability rather than accretional or erosional events. Provide more information on why artifacts are interpreted as disturbed rather than in primary context.	The text in the updated Class III report has been updated to address this comment. As noted above, additional testing is planned to occur at 32WI976 this fall, which will provide additional information on the soils present at the site.	Section 5.4
o 32MZ976 – Did cut bank provide additional information on buried soils? Were artifacts identified in cut bank?	The cut bank was examined during the initial survey. As noted above, additional testing is planned to occur at the site this fall with results to be discussed in an addendum report.	Section 5.4
o 32WI976 – Given size and shape of site, additional TUs recommended.		
Comments from the Bureau of Land Management		
o The recommended protection/avoidance measures for unevaluated and eligible archaeological sites in the Class III report are inadequate, particularly regarding stone feature sites. The usual avoidance distance requested/required by the BLM is 100 feet. More than 100 feet is preferred for stone feature sites. Revise protection/avoidance measures buffers for archaeological sites.	WBI Energy has routed the pipeline to avoid unevaluated and eligible sites with a minimum buffer of 50 ft as directed by the SHSND.	Sections 5.3 through 5.5
o Why were indirect effects to archaeological sites not considered? Setting is an important aspect of integrity for stone feature sites. There are numerous archaeological sites within and near the survey corridor that should be analyzed for indirect effects. Revise the report to address indirect effects to archaeological sites.	The report has been updated to include an assessment of physical and non-physical impacts on unevaluated and eligible sites.	Sections 4 and 5.5 through 5.5
o WBI Energy needs to develop a cultural resource monitoring plan for construction.	WBI Energy commits to preparing a monitoring plan for construction.	Sections 5.3 through 5.5
o Update site form for all sites, site leads, and isolated finds regardless of whether they were relocated. Even if a cultural resource could not be relocated, that is still valuable information for the next project/site visit.	Site form updates have been submitted for all sites, isolated finds, and site leads discussed in the updated Class III report	N/A
o WBI Energy should make additional efforts to involve tribes in upcoming 2020 fieldwork and field reviews.	As discussed in more detail in Section 4 of the updated Class III report, WBI Energy retained Beaver Creek Archaeology to coordinate tribal participation in fieldwork in 2020. BCA worked with tribes to document sites as cultural heritage resources. The results of that work will be presented in a separate report. Information on tribal participation in the surveys also is provided in Sections 4 and 5.3 through 5.5 of ERM's updated Class III report	Sections 4 and 5.3 through 5.5

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Comments from U.S. Army Corps of Engineers		
o In section 5.4.2, remove figures for 32MZ0598 and move to the previous section.	This comment is addressed in the updated Class III report	Section 5.4
o Figure 5.4-5: Map of Site 32WI976, provide contour lines on this map to show the slope. This information would help to explain why the shovel testing pattern appears the way it does.	Contour lines are provided on Figure 5.4-9 in the updated Class III report.	Section 5.4
o ERM, on behalf of WBI [Energy], identified a second concentration of artifacts in the western side of site 32WI0976 after they started excavating the test unit. Some additional testing is needed here as USACE cannot agree with the recommended determination for this site given the data presented in this report.	Additional testing will be completed at this site in the fall of 2020 with the results presented in an addendum report.	Section 5.4
o USACE recommends that WBI [Energy] conduct a remote sensing evaluation (gradiometer or conductivity) at site 32WI0976. This would be the best way to produce measurable data regarding the presence/absence of subsurface features at the site.	A remote sensing survey of the site was completed in the summer of 2020. The results of the survey were used to prepare a testing plan for 32WI976. Additional testing at the site will occur this fall with the results presented in an addendum report.	Section 5.4
Comments from the U.S. Forest Service		
o The map showing previously recorded cultural resources within a one-mile radius is only included in the overall Class III and not in the Forest Service stand-alone report. Please include this in the stand-alone Forest Service report.	This comment is no longer applicable. Survey results for USFS lands are included in the updated Class III inventory report in Section 5.5.	N/A
o Figure 1.1-2 shows the Forest Service surface and differentiates between the survey corridor and the survey corridor on Forest Service surface; however, the survey corridor on Forest Service surface and the actual Forest Service surface displayed don't match.	This comment is no longer applicable. Survey results for USFS lands are included in the updated Class III inventory report in Section 5.5.	N/A
o Sites 32MZ2347 (Historical Archaeological) and 32MZ3278 (Cairn) are located immediately adjacent to the survey corridor but are not discussed. Please discuss.	Based on route modifications, 32MZ3278 was visited in 2020 and the site boundary expanded based on the findings. A discussion of the site is provided in the updated Class III report. 32MZ2347 is outside the inventory corridor for the Project; however, we have included a discussion of this site in the Class III inventory report.	Section 5.5
o Site 32MZ145 site form update does not appear to have been performed. Why? Was an attempt made to actually relocate the site? Also, according to the site form, a THPO representative requested avoidance in 2013. More work on this site is probably needed.	When 32MZ145 was first recorded in 1979, it was characterized as two stone cairns. Subsequent investigations described the site as consisting of a single historic rock clearing pile on the west side of Highway 1806, noting that the second pile was likely destroyed by construction of the highway. ERM's survey in 2019 was limited to the east side of Highway 1806, which explains why we did not relocate the site at that time. In 2020, ERM conducted additional survey on USFS lands, examining a corridor on the west side of Highway 1806. 32MZ145 was relocated as a result of this work. The site is discussed in the updated Class III report. Tribal cultural specialists who accompanied ERM during the 2020 field investigation concurred that 32MZ145 is historic rock clearing pile.	Section 5.5

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
o Site 32MZ2346 and 32MZ144: it is very improbable and therefore suspicious that there are zero artifacts and one artifact respectively at sites with historic dumps.	Sites 32MZ2346 and 32MZ144 are both previously recorded historic sites which ERM revisited and recorded during the survey for the Project. Cultural material was observed at both sites as described in the updated Class III report. ERM expanded the boundaries of 32MZ2346 to encompass two previously unreported features at the site. One artifact–a commemorative coin–was collected from 32MZ2346 because of its uniqueness. No artifacts were collected from 32MZ144. Expanded descriptions of both sites are provided in the updated Class III report.	Section 5.5
o Additional survey is shown as needed near site 32MZ3278 on the maps in the overall Class III report but not in the Forest Service stand-alone report. Please include this in the stand-alone Forest Service report.	Additional survey was completed in 2020 on USFS lands in the vicinity of 32MZ3278, which was relocated. A description of the site is provided in the updated Class III report.	Section 5.5
o The recommended avoidance and fencing measures are inadequate, especially for stone feature sites.	All stone feature sites have been avoided with a minimum buffet of 50 ft. Additionally, for sites between 50 and 100 ft of Project workspace WBI Energy commits to fencing and monitoring the sites during construction. WBI Energy will provide a monitoring plan for agency review.	Section 5.5
o A monitoring plan is needed.	WBI Energy commits to providing a construction monitoring plan as discussed in the updated Class III report.	
o Updates should have been conducted for all sites, site leads, and IFs [isolated finds] regardless of whether or not they were relocated.	Site form updates have been submitted for all applicable sites, isolated finds, and site leads discussed in the report	N/A
o The discussion of site leads during fieldwork is inadequate.	Site leads are discussed in Section 5.6 of the updated Class III report.	Section 5.6
o Provide specific distances between site boundaries and the edge of the workspace.	Distances between sites and Project workspaces have been added to summary tables and site descriptions throughout the updated Class III report.	Sections 5.3 through 5.5
o Provide a map of shovel testing performed outside of site boundaries. The report explains the testing strategy during survey but never discusses or shows specifics except within site boundaries.	The route maps provided as Appendix B depict survey methodology in addition to survey coverage and results.	Appendix B
o Identify the level of tribal involvement in the survey.	Tribal participation in field surveys is discussed in Sections 4 and 5.3 through 5.5 of the updated Class III report.	Sections 4 and 5.3 through 5.5
o Discuss whether indirect effects to archaeological sites were considered.	For unevaluated sites, we have added an assessment of non-physical impacts on setting.	Sections 5.3 through 5.5

LOG OF CONVERSATION

Andy Clark, State Archaeologist for North Dakota, returned my call from the day before. I discussed the site visits that took place on Friday 9/11/2020 with other agencies and the Assiniboine & Sioux Tribes and asked if Andy had any questions regarding the Project. Andy has some questions he will direct to FERC, but nothing for ERM or WBI Energy.

Subject: WBI Energy Transmission, Inc.
North Bakken Expansion Project – Class III Survey Reports 2020 Field Season
McKenzie, Williams, Burke, and Mountrail Counties, North Dakota
ND SHPO Ref.: 19-5593

Dear Mr. Eagle:

Please reference WBI Energy Transmission, Inc.'s (WBI Energy's) previous correspondence regarding the above referenced project. WBI Energy proposes to construct and operate the North Bakken Expansion Project (Project) in McKenzie, Williams, Burke, and Mountrail Counties, North Dakota.

The Project is regulated by the Federal Energy Regulatory Commission (FERC) under Section 7(c) of the Natural Gas Act. Under the Energy Policy Act of 2005, FERC is the lead agency for coordinating federal authorizations and complying with the National Environmental Policy Act on natural gas pipeline projects subject to its jurisdiction. FERC similarly is the lead federal agency for complying with Section 106 of the National Historic Preservation Act (NHPA) on natural gas pipeline projects under its jurisdiction. In accordance with 36 CFR 800.2(c)(4), WBI Energy is assisting the FERC in meeting its obligations under Section 106 of the NHPA by coordinating with agencies and tribes and conducting surveys to identify historic properties that may be affected by the Project.

Enclosed for your review please find Class III survey reports for the archaeological and historic structures surveys that were conducted during the 2019 and 2020 field seasons. The archaeological report includes the results provided in the original Class III report and addresses comments that were provided by the State Historical Society of North Dakota, Bureau of Land Management, U.S. Army Corps of Engineers, and the U.S. Forest Service. The attached table summarizes our response to those comments and provides the location of the relevant revisions or clarifications. A report on geomorphological investigations is also included in this submittal.

WBI Energy would appreciate your comments on the attached reports. If you have any questions or comments on the Project or the reports, please contact me at 612-840-8976 or pat.robblee@erm.com, or Dr. Kevin Malloy at 906-285-0361 or kevin.malloy@erm.com. Please direct written correspondence to Dr. Malloy's attention at:

Attachment: Table summarizing agency comments on the original Class III archaeology report

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Comments from the State Historical Society of North Dakota		
General comments:		
o Provide more background information on sites with previous work. Focus on methods and reasoning for previous eligibility recommendation.	Additional information on previous investigations has been added to site descriptions, as applicable.	Sections 5.3 through 5.7
o Map symbology has item named "Shovel test – No Dig". Are these shovel probes that were planned, but not excavated for some reason? If so provide explanation.	These are planned but unexcavated shovel tests. Site descriptions have been updated, as applicable, to explain why some planned shovel tests were not excavated. Typical reasons for not excavating shovel tests include the presence of buried utilities (documented through One-Call markings) or slope.	Sections 5.3 through 5.5
Avoidance, 50 ft buffer minimum, fence, and monitor:		
o Private land: 32BK277, 32BK279, 32BK280, 32BK282, 32MZ3308, 32MZ3309, 32MZ3310, 32MZ3311, 32MZ3325, 32MZ3327, 32WI1494, 32WI1630, 32WI2144, 32WI2388, 32WI2389, 32WI2391, 32WI2392, 32WI2393, 32WI2394, 32WI2398, 32WI2406, 32WI2408.	Each of these sites is avoided with a minimum 50 ft buffer. Additionally, for sites located between 50 and 100 ft of Project workspace, WBI Energy commits to fencing and monitoring at these locations.	Section 5.3
o US Forest Service Sites: 32MZ3301, 32MZ3314, 32MZ3315, 32MZ3319, 32MZ3320, 32MZ3322, 32MZ3324.	Each of these sites is avoided with a minimum 50 ft buffer. Additionally, for sites located between 50 and 100 ft of Project workspace, WBI Energy commits to fencing and monitoring at these locations.	Section 5.5
Formally evaluate with site delineation and at least one 1x1 m TU. Submit evaluation plan prior to fieldwork:		
o Private Land: 32BK278, 32MZ3302, 32MZ3306, 32MZ3307, 32MZ3318, 32MZ3323, 32MZ3326, 32MZ3328, 32MZ3329, 32MZ3331, 32WI2390, 32WI2405, 32WI2407, 32WI2409, 32WI2410.	Additional testing (shovel testing and/or the excavation of at least one, 1 x 1 m test unit) was completed at each of these sites in accordance with a testing plan approved by the SHSND. Testing at sites 32WI2390 and 32MZ3328 was suspended following the identification of stone features at these sites; however, the pipeline route has been adjusted to avoid these sites with a minimum 50-ft buffer.	Section 5.3
o US Forest Service Site: 32MZ2346.	While ERM planned to conduct additional testing at this site, the pipeline route was modified prior to this work such that the site is now avoided by the Project with a buffer greater than 100 ft.	Section 5.5
Isolated finds:		
o Discuss subsurface potential on all IFs on a case-by-case basis. If the finds are in a good depositional context, STPs may be necessary to show that these are truly isolates. Minimal site recording may be enough to get a site number for database purposes, but more information is needed to verify that these are truly part of a category that can be written-off as not eligible.	Individual descriptions of isolated finds have been added to the text, including the results of shovel testing or an explanation for why shovel tests were not excavated.	Section 5.7

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Site-by-site comments, private land:		
o 32BK168 – Expand reasoning for Not Eligible Determination both previously and now. Newly recorded site boundary included previously unidentified features. Perhaps site should be unevaluated. Consider formal evaluation and provide updated management recommendations.	ERM conducted site testing at 32BK168 in 2020. Evidence of intact cultural deposits and features was identified during testing and the site is now recommended as eligible for listing in the NRHP. The pipeline route has been modified to avoid this site with a buffer of 57 ft.	Section 5.3
o 32MZ3323 – Discussion mentions "Better Examples" of homesteads. Provide examples.	The description for 32MZ3323 has been updated to incorporate the results of additional testing (shovel testing and the excavation of a 1 x 1 m test unit) in the updated Class III report.	Section 5.3
o 32WI1495 – Actual well shown in Figure 5.3-81 may be visible in figure 5.3-80. Is this location impacted by project? Consider site lead.	The location of the well (which is no longer extant) is discussed in the updated Class III report in conjunction with 32WI1495. ERM has submitted a site lead form for this resource. The suggested boundary of the site lead is 19 ft from Project workspace. The actual location of the well is about 235 ft from Project workspace.	Section 5.3
o 32WI2404 – How is this identified as prehistoric? Could it be a result of natural glacial and/or historic or modern field clearing? Provide evidence. Fence and monitor as necessary.	The interpretation of the feature at 32WI2404 as prehistoric is conservative and based on best professional judgement. Tribal cultural specialists who visited the site with ERM concurred with this interpretation.	Section 5.3
o 32WI2408 – Workspace is extremely close to possible graves. Is the planned route fixed?	The pipeline route has been modified to avoid this site with a buffer of 213 ft.	Section 5.3
Site-by-site comments, US Army Corps of Engineers land:		
o 32MZ976 – Drilling under site is not avoidance as leaks and emergency repairs do consider cultural resources. Formal testing or horizontal avoidance is necessary.	The trajectory of the HDD will be 160 to 180 ft below ground surface where it passes beneath 32WI976. The pipeline will carry gas, not a liquid; the gas would migrate to the surface and dissipate into the air in the event of a leak. Given the depth of the HDD installation, daylighting of the pipeline for repair would not be feasible. If repair is required in the future, the most likely course of action would be to re-install a new segment via HDD, which would require federal authorizations, thereby triggering review of the action under Section 106 of the NHPA. A description of the HDD method has been added to the description of 32WI976 in Section 5.4 of the report. Additional testing at the site is pending and scheduled to be completed this fall. The results will be discussed in an addendum report.	Section 5.4
o 32MZ976 – Show bore location and HDD line on map	A figure showing the HDD alignment with entry and exit points has been added to the description of this site as has a construction alignment sheet. The alignment sheet depicts the HDD in plan and profile.	Section 5.4

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
o 32MZ976 – Clarify and provide more evidence for geomorphological hypothesis of A horizon being related to flood deposits. Typically, A horizons show stability rather than accretional or erosional events. Provide more information on why artifacts are interpreted as disturbed rather than in primary context.	The text in the updated Class III report has been updated to address this comment. As noted above, additional testing is planned to occur at 32WI976 this fall, which will provide additional information on the soils present at the site.	Section 5.4
o 32MZ976 – Did cut bank provide additional information on buried soils? Were artifacts identified in cut bank?	The cut bank was examined during the initial survey. As noted above, additional testing is planned to occur at the site this fall with results to be discussed in an addendum report.	Section 5.4
o 32WI976 – Given size and shape of site, additional TUs recommended.		
Comments from the Bureau of Land Management		
o The recommended protection/avoidance measures for unevaluated and eligible archaeological sites in the Class III report are inadequate, particularly regarding stone feature sites. The usual avoidance distance requested/required by the BLM is 100 feet. More than 100 feet is preferred for stone feature sites. Revise protection/avoidance measures buffers for archaeological sites.	WBI Energy has routed the pipeline to avoid unevaluated and eligible sites with a minimum buffer of 50 ft as directed by the SHSND.	Sections 5.3 through 5.5
o Why were indirect effects to archaeological sites not considered? Setting is an important aspect of integrity for stone feature sites. There are numerous archaeological sites within and near the survey corridor that should be analyzed for indirect effects. Revise the report to address indirect effects to archaeological sites.	The report has been updated to include an assessment of physical and non-physical impacts on unevaluated and eligible sites.	Sections 4 and 5.5 through 5.5
o WBI Energy needs to develop a cultural resource monitoring plan for construction.	WBI Energy commits to preparing a monitoring plan for construction.	Sections 5.3 through 5.5
o Update site form for all sites, site leads, and isolated finds regardless of whether they were relocated. Even if a cultural resource could not be relocated, that is still valuable information for the next project/site visit.	Site form updates have been submitted for all sites, isolated finds, and site leads discussed in the updated Class III report	N/A
o WBI Energy should make additional efforts to involve tribes in upcoming 2020 fieldwork and field reviews.	As discussed in more detail in Section 4 of the updated Class III report, WBI Energy retained Beaver Creek Archaeology to coordinate tribal participation in fieldwork in 2020. BCA worked with tribes to document sites as cultural heritage resources. The results of that work will be presented in a separate report. Information on tribal participation in the surveys also is provided in Sections 4 and 5.3 through 5.5 of ERM's updated Class III report	Sections 4 and 5.3 through 5.5

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Comments from U.S. Army Corps of Engineers		
o In section 5.4.2, remove figures for 32MZ0598 and move to the previous section.	This comment is addressed in the updated Class III report	Section 5.4
o Figure 5.4-5: Map of Site 32WI976, provide contour lines on this map to show the slope. This information would help to explain why the shovel testing pattern appears the way it does.	Contour lines are provided on Figure 5.4-9 in the updated Class III report.	Section 5.4
o ERM, on behalf of WBI [Energy], identified a second concentration of artifacts in the western side of site 32WI0976 after they started excavating the test unit. Some additional testing is needed here as USACE cannot agree with the recommended determination for this site given the data presented in this report.	Additional testing will be completed at this site in the fall of 2020 with the results presented in an addendum report.	Section 5.4
o USACE recommends that WBI [Energy] conduct a remote sensing evaluation (gradiometer or conductivity) at site 32WI0976. This would be the best way to produce measurable data regarding the presence/absence of subsurface features at the site.	A remote sensing survey of the site was completed in the summer of 2020. The results of the survey were used to prepare a testing plan for 32WI976. Additional testing at the site will occur this fall with the results presented in an addendum report.	Section 5.4
Comments from the U.S. Forest Service		
o The map showing previously recorded cultural resources within a one-mile radius is only included in the overall Class III and not in the Forest Service stand-alone report. Please include this in the stand-alone Forest Service report.	This comment is no longer applicable. Survey results for USFS lands are included in the updated Class III inventory report in Section 5.5.	N/A
o Figure 1.1-2 shows the Forest Service surface and differentiates between the survey corridor and the survey corridor on Forest Service surface; however, the survey corridor on Forest Service surface and the actual Forest Service surface displayed don't match.	This comment is no longer applicable. Survey results for USFS lands are included in the updated Class III inventory report in Section 5.5.	N/A
o Sites 32MZ2347 (Historical Archaeological) and 32MZ3278 (Cairn) are located immediately adjacent to the survey corridor but are not discussed. Please discuss.	Based on route modifications, 32MZ3278 was visited in 2020 and the site boundary expanded based on the findings. A discussion of the site is provided in the updated Class III report. 32MZ2347 is outside the inventory corridor for the Project; however, we have included a discussion of this site in the Class III inventory report.	Section 5.5
o Site 32MZ145 site form update does not appear to have been performed. Why? Was an attempt made to actually relocate the site? Also, according to the site form, a THPO representative requested avoidance in 2013. More work on this site is probably needed.	When 32MZ145 was first recorded in 1979, it was characterized as two stone cairns. Subsequent investigations described the site as consisting of a single historic rock clearing pile on the west side of Highway 1806, noting that the second pile was likely destroyed by construction of the highway. ERM's survey in 2019 was limited to the east side of Highway 1806, which explains why we did not relocate the site at that time. In 2020, ERM conducted additional survey on USFS lands, examining a corridor on the west side of Highway 1806. 32MZ145 was relocated as a result of this work. The site is discussed in the updated Class III report. Tribal cultural specialists who accompanied ERM during the 2020 field investigation concurred that 32MZ145 is historic rock clearing pile.	Section 5.5

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
o Site 32MZ2346 and 32MZ144: it is very improbable and therefore suspicious that there are zero artifacts and one artifact respectively at sites with historic dumps.	Sites 32MZ2346 and 32MZ144 are both previously recorded historic sites which ERM revisited and recorded during the survey for the Project. Cultural material was observed at both sites as described in the updated Class III report. ERM expanded the boundaries of 32MZ2346 to encompass two previously unreported features at the site. One artifact–a commemorative coin–was collected from 32MZ2346 because of its uniqueness. No artifacts were collected from 32MZ144. Expanded descriptions of both sites are provided in the updated Class III report.	Section 5.5
o Additional survey is shown as needed near site 32MZ3278 on the maps in the overall Class III report but not in the Forest Service stand-alone report. Please include this in the stand-alone Forest Service report.	Additional survey was completed in 2020 on USFS lands in the vicinity of 32MZ3278, which was relocated. A description of the site is provided in the updated Class III report.	Section 5.5
o The recommended avoidance and fencing measures are inadequate, especially for stone feature sites.	All stone feature sites have been avoided with a minimum buffet of 50 ft. Additionally, for sites between 50 and 100 ft of Project workspace WBI Energy commits to fencing and monitoring the sites during construction. WBI Energy will provide a monitoring plan for agency review.	Section 5.5
o A monitoring plan is needed.	WBI Energy commits to providing a construction monitoring plan as discussed in the updated Class III report.	
o Updates should have been conducted for all sites, site leads, and IFs [isolated finds] regardless of whether or not they were relocated.	Site form updates have been submitted for all applicable sites, isolated finds, and site leads discussed in the report	N/A
o The discussion of site leads during fieldwork is inadequate.	Site leads are discussed in Section 5.6 of the updated Class III report.	Section 5.6
o Provide specific distances between site boundaries and the edge of the workspace.	Distances between sites and Project workspaces have been added to summary tables and site descriptions throughout the updated Class III report.	Sections 5.3 through 5.5
o Provide a map of shovel testing performed outside of site boundaries. The report explains the testing strategy during survey but never discusses or shows specifics except within site boundaries.	The route maps provided as Appendix B depict survey methodology in addition to survey coverage and results.	Appendix B
o Identify the level of tribal involvement in the survey.	Tribal participation in field surveys is discussed in Sections 4 and 5.3 through 5.5 of the updated Class III report.	Sections 4 and 5.3 through 5.5
o Discuss whether indirect effects to archaeological sites were considered.	For unevaluated sites, we have added an assessment of non-physical impacts on setting.	Sections 5.3 through 5.5

MEETING NOTES

LOG OF IN PERSON MEETING

MEETING ATTENDEES:

Jon Eagle – Standing Rock Sioux Tribe Tribal Historic Preservation Officer
Ben Rhodd – Rosebud Sioux Tribe Archaeologist
Katie West – Bureau of Land Management (BLM)
Jill Linn – WBI Energy Transmission, Inc. (WBI Energy)
Wade Burns – Beaver Creek Archaeology (BCA)
Raina Hanley – BCA
Larry Pallozzi – BCA
Jayson Zoino – Environmental Resource Group (ERM)

DATE:	TIME OF CONVERSATION:
September 17, 2020	10 am to 1 pm

RE:

North Bakken Expansion Project

LOG OF CONVERSATION:

ERM visited sites 32MZ3382, 32MZ3383, and 32MZ3385 on U.S. Forest Service lands with representatives of the Standing Rock Sioux Tribe, Rosebud Sioux Tribe, BLM, WBI Energy, and BCA.[1] ERM documented these sites in the summer of 2020 during survey for WBI Energy's North Bakken Expansion Project. Tribal cultural specialists representing the Standing Rock Sioux Tribe, Rosebud Sioux Tribe (including one specialist working on behalf of the Sisseton Wahpeton Oyate Tribe), Assiniboine & Sioux Tribes, and Turtle Mountain Band of Chippewa Indians monitored ERM's delineation of the sites; however, the specialists did not uniformly concur with the interpretation of the finds as archaeological. Some of the specialists concluded that the remains documented by ERM are non-cultural.

The visits to 32MZ3382, 32MZ3383, and 32MZ3385 allowed Mr. Eagle and Mr. Rhodd to inspect the sites and features recorded by ERM. Mr. Eagle and Mr. Rhodd each concurred with the interpretation of the finds as archaeological and agreed with a majority of ERM's feature classifications for the sites. Mr. Eagle and Mr. Rhodd provided additional interpretation of some features, which will be incorporated into the cultural heritage forms for these sites. This includes an expansion of the area at 32MZ3383 to be recorded as a cultural heritage site to encompass a cluster of Echinacea identified near the archaeological features.

[1] The U.S. Forest Service was unable to participate in the site visits.

Subject: WBI Energy Transmission, Inc.
North Bakken Expansion Project – Class III Survey Reports 2020 Field Season
McKenzie, Williams, Burke, and Mountrail Counties, North Dakota
ND SHPO Ref.: 19-5593

Dear Ms. Desrosiers:

Please reference WBI Energy Transmission, Inc.'s (WBI Energy's) previous correspondence regarding the above referenced project. WBI Energy proposes to construct and operate the North Bakken Expansion Project (Project) in McKenzie, Williams, Burke, and Mountrail Counties, North Dakota.

The Project is regulated by the Federal Energy Regulatory Commission (FERC) under Section 7(c) of the Natural Gas Act. Under the Energy Policy Act of 2005, FERC is the lead agency for coordinating federal authorizations and complying with the National Environmental Policy Act on natural gas pipeline projects subject to its jurisdiction. FERC similarly is the lead federal agency for complying with Section 106 of the National Historic Preservation Act (NHPA) on natural gas pipeline projects under its jurisdiction. In accordance with 36 CFR 800.2(c)(4), WBI Energy is assisting the FERC in meeting its obligations under Section 106 of the NHPA by coordinating with agencies and tribes and conducting surveys to identify historic properties that may be affected by the Project.

Enclosed for your review please find Class III survey reports for the archaeological and historic structures surveys that were conducted during the 2019 and 2020 field seasons. The archaeological report includes the results provided in the original Class III report and addresses comments that were provided by the State Historical Society of North Dakota, Bureau of Land Management, U.S. Army Corps of Engineers, and the U.S. Forest Service. The attached table summarizes our response to those comments and provides the location of the relevant revisions or clarifications. A report on geomorphological investigations is also included in this submittal.

WBI Energy would appreciate your comments on the attached reports. If you have any questions or comments on the Project or the reports, please contact me at 612-840-8976 or pat.robblee@erm.com, or Dr. Kevin Malloy at 906-285-0361 or kevin.malloy@erm.com. Please direct written correspondence to Dr. Malloy's attention at:

Attachment: Table summarizing agency comments on the original Class III archaeology report

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Comments from the State Historical Society of North Dakota		
General comments:		
o Provide more background information on sites with previous work. Focus on methods and reasoning for previous eligibility recommendation.	Additional information on previous investigations has been added to site descriptions, as applicable.	Sections 5.3 through 5.7
o Map symbology has item named "Shovel test – No Dig". Are these shovel probes that were planned, but not excavated for some reason? If so provide explanation.	These are planned but unexcavated shovel tests. Site descriptions have been updated, as applicable, to explain why some planned shovel tests were not excavated. Typical reasons for not excavating shovel tests include the presence of buried utilities (documented through One-Call markings) or slope.	Sections 5.3 through 5.5
Avoidance, 50 ft buffer minimum, fence, and monitor:		
o Private land: 32BK277, 32BK279, 32BK280, 32BK282, 32MZ3308, 32MZ3309, 32MZ3310, 32MZ3311, 32MZ3325, 32MZ3327, 32WI1494, 32WI1630, 32WI2144, 32WI2388, 32WI2389, 32WI2391, 32WI2392, 32WI2393, 32WI2394, 32WI2398, 32WI2406, 32WI2408.	Each of these sites is avoided with a minimum 50 ft buffer. Additionally, for sites located between 50 and 100 ft of Project workspace, WBI Energy commits to fencing and monitoring at these locations.	Section 5.3
o US Forest Service Sites: 32MZ3301, 32MZ3314, 32MZ3315, 32MZ3319, 32MZ3320, 32MZ3322, 32MZ3324.	Each of these sites is avoided with a minimum 50 ft buffer. Additionally, for sites located between 50 and 100 ft of Project workspace, WBI Energy commits to fencing and monitoring at these locations.	Section 5.5
Formally evaluate with site delineation and at least one 1x1 m TU. Submit evaluation plan prior to fieldwork:		
o Private Land: 32BK278, 32MZ3302, 32MZ3306, 32MZ3307, 32MZ3318, 32MZ3323, 32MZ3326, 32MZ3328, 32MZ3329, 32MZ3331, 32WI2390, 32WI2405, 32WI2407, 32WI2409, 32WI2410.	Additional testing (shovel testing and/or the excavation of at least one, 1 x 1 m test unit) was completed at each of these sites in accordance with a testing plan approved by the SHSND. Testing at sites 32WI2390 and 32MZ3328 was suspended following the identification of stone features at these sites; however, the pipeline route has been adjusted to avoid these sites with a minimum 50-ft buffer.	Section 5.3
o US Forest Service Site: 32MZ2346.	While ERM planned to conduct additional testing at this site, the pipeline route was modified prior to this work such that the site is now avoided by the Project with a buffer greater than 100 ft.	Section 5.5
Isolated finds:		
o Discuss subsurface potential on all IFs on a case-by-case basis. If the finds are in a good depositional context, STPs may be necessary to show that these are truly isolates. Minimal site recording may be enough to get a site number for database purposes, but more information is needed to verify that these are truly part of a category that can be written-off as not eligible.	Individual descriptions of isolated finds have been added to the text, including the results of shovel testing or an explanation for why shovel tests were not excavated.	Section 5.7

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Site-by-site comments, private land:		
o 32BK168 – Expand reasoning for Not Eligible Determination both previously and now. Newly recorded site boundary included previously unidentified features. Perhaps site should be unevaluated. Consider formal evaluation and provide updated management recommendations.	ERM conducted site testing at 32BK168 in 2020. Evidence of intact cultural deposits and features was identified during testing and the site is now recommended as eligible for listing in the NRHP. The pipeline route has been modified to avoid this site with a buffer of 57 ft.	Section 5.3
o 32MZ3323 – Discussion mentions "Better Examples" of homesteads. Provide examples.	The description for 32MZ3323 has been updated to incorporate the results of additional testing (shovel testing and the excavation of a 1 x 1 m test unit) in the updated Class III report.	Section 5.3
o 32WI1495 – Actual well shown in Figure 5.3-81 may be visible in figure 5.3-80. Is this location impacted by project? Consider site lead.	The location of the well (which is no longer extant) is discussed in the updated Class III report in conjunction with 32WI1495. ERM has submitted a site lead form for this resource. The suggested boundary of the site lead is 19 ft from Project workspace. The actual location of the well is about 235 ft from Project workspace.	Section 5.3
o 32WI2404 – How is this identified as prehistoric? Could it be a result of natural glacial and/or historic or modern field clearing? Provide evidence. Fence and monitor as necessary.	The interpretation of the feature at 32WI2404 as prehistoric is conservative and based on best professional judgement. Tribal cultural specialists who visited the site with ERM concurred with this interpretation.	Section 5.3
o 32WI2408 – Workspace is extremely close to possible graves. Is the planned route fixed?	The pipeline route has been modified to avoid this site with a buffer of 213 ft.	Section 5.3
Site-by-site comments, US Army Corps of Engineers land:		
o 32MZ976 – Drilling under site is not avoidance as leaks and emergency repairs do consider cultural resources. Formal testing or horizontal avoidance is necessary.	The trajectory of the HDD will be 160 to 180 ft below ground surface where it passes beneath 32WI976. The pipeline will carry gas, not a liquid; the gas would migrate to the surface and dissipate into the air in the event of a leak. Given the depth of the HDD installation, daylighting of the pipeline for repair would not be feasible. If repair is required in the future, the most likely course of action would be to re-install a new segment via HDD, which would require federal authorizations, thereby triggering review of the action under Section 106 of the NHPA. A description of the HDD method has been added to the description of 32WI976 in Section 5.4 of the report. Additional testing at the site is pending and scheduled to be completed this fall. The results will be discussed in an addendum report.	Section 5.4
o 32MZ976 – Show bore location and HDD line on map	A figure showing the HDD alignment with entry and exit points has been added to the description of this site as has a construction alignment sheet. The alignment sheet depicts the HDD in plan and profile.	Section 5.4

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
o 32MZ976 – Clarify and provide more evidence for geomorphological hypothesis of A horizon being related to flood deposits. Typically, A horizons show stability rather than accretional or erosional events. Provide more information on why artifacts are interpreted as disturbed rather than in primary context.	The text in the updated Class III report has been updated to address this comment. As noted above, additional testing is planned to occur at 32WI976 this fall, which will provide additional information on the soils present at the site.	Section 5.4
o 32MZ976 – Did cut bank provide additional information on buried soils? Were artifacts identified in cut bank?	The cut bank was examined during the initial survey. As noted above, additional testing is planned to occur at the site this fall with results to be discussed in an addendum report.	Section 5.4
o 32WI976 – Given size and shape of site, additional TUs recommended.		
Comments from the Bureau of Land Management		
o The recommended protection/avoidance measures for unevaluated and eligible archaeological sites in the Class III report are inadequate, particularly regarding stone feature sites. The usual avoidance distance requested/required by the BLM is 100 feet. More than 100 feet is preferred for stone feature sites. Revise protection/avoidance measures buffers for archaeological sites.	WBI Energy has routed the pipeline to avoid unevaluated and eligible sites with a minimum buffer of 50 ft as directed by the SHSND.	Sections 5.3 through 5.5
o Why were indirect effects to archaeological sites not considered? Setting is an important aspect of integrity for stone feature sites. There are numerous archaeological sites within and near the survey corridor that should be analyzed for indirect effects. Revise the report to address indirect effects to archaeological sites.	The report has been updated to include an assessment of physical and non-physical impacts on unevaluated and eligible sites.	Sections 4 and 5.5 through 5.5
o WBI Energy needs to develop a cultural resource monitoring plan for construction.	WBI Energy commits to preparing a monitoring plan for construction.	Sections 5.3 through 5.5
o Update site form for all sites, site leads, and isolated finds regardless of whether they were relocated. Even if a cultural resource could not be relocated, that is still valuable information for the next project/site visit.	Site form updates have been submitted for all sites, isolated finds, and site leads discussed in the updated Class III report	N/A
o WBI Energy should make additional efforts to involve tribes in upcoming 2020 fieldwork and field reviews.	As discussed in more detail in Section 4 of the updated Class III report, WBI Energy retained Beaver Creek Archaeology to coordinate tribal participation in fieldwork in 2020. BCA worked with tribes to document sites as cultural heritage resources. The results of that work will be presented in a separate report. Information on tribal participation in the surveys also is provided in Sections 4 and 5.3 through 5.5 of ERM's updated Class III report	Sections 4 and 5.3 through 5.5

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Comments from U.S. Army Corps of Engineers		
o In section 5.4.2, remove figures for 32MZ0598 and move to the previous section.	This comment is addressed in the updated Class III report	Section 5.4
o Figure 5.4-5: Map of Site 32WI976, provide contour lines on this map to show the slope. This information would help to explain why the shovel testing pattern appears the way it does.	Contour lines are provided on Figure 5.4-9 in the updated Class III report.	Section 5.4
o ERM, on behalf of WBI [Energy], identified a second concentration of artifacts in the western side of site 32WI0976 after they started excavating the test unit. Some additional testing is needed here as USACE cannot agree with the recommended determination for this site given the data presented in this report.	Additional testing will be completed at this site in the fall of 2020 with the results presented in an addendum report.	Section 5.4
o USACE recommends that WBI [Energy] conduct a remote sensing evaluation (gradiometer or conductivity) at site 32WI0976. This would be the best way to produce measurable data regarding the presence/absence of subsurface features at the site.	A remote sensing survey of the site was completed in the summer of 2020. The results of the survey were used to prepare a testing plan for 32WI976. Additional testing at the site will occur this fall with the results presented in an addendum report.	Section 5.4
Comments from the U.S. Forest Service		
o The map showing previously recorded cultural resources within a one-mile radius is only included in the overall Class III and not in the Forest Service stand-alone report. Please include this in the stand-alone Forest Service report.	This comment is no longer applicable. Survey results for USFS lands are included in the updated Class III inventory report in Section 5.5.	N/A
o Figure 1.1-2 shows the Forest Service surface and differentiates between the survey corridor and the survey corridor on Forest Service surface; however, the survey corridor on Forest Service surface and the actual Forest Service surface displayed don't match.	This comment is no longer applicable. Survey results for USFS lands are included in the updated Class III inventory report in Section 5.5.	N/A
o Sites 32MZ2347 (Historical Archaeological) and 32MZ3278 (Cairn) are located immediately adjacent to the survey corridor but are not discussed. Please discuss.	Based on route modifications, 32MZ3278 was visited in 2020 and the site boundary expanded based on the findings. A discussion of the site is provided in the updated Class III report. 32MZ2347 is outside the inventory corridor for the Project; however, we have included a discussion of this site in the Class III inventory report.	Section 5.5
o Site 32MZ145 site form update does not appear to have been performed. Why? Was an attempt made to actually relocate the site? Also, according to the site form, a THPO representative requested avoidance in 2013. More work on this site is probably needed.	When 32MZ145 was first recorded in 1979, it was characterized as two stone cairns. Subsequent investigations described the site as consisting of a single historic rock clearing pile on the west side of Highway 1806, noting that the second pile was likely destroyed by construction of the highway. ERM's survey in 2019 was limited to the east side of Highway 1806, which explains why we did not relocate the site at that time. In 2020, ERM conducted additional survey on USFS lands, examining a corridor on the west side of Highway 1806. 32MZ145 was relocated as a result of this work. The site is discussed in the updated Class III report. Tribal cultural specialists who accompanied ERM during the 2020 field investigation concurred that 32MZ145 is historic rock clearing pile.	Section 5.5

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
o Site 32MZ2346 and 32MZ144: it is very improbable and therefore suspicious that there are zero artifacts and one artifact respectively at sites with historic dumps.	Sites 32MZ2346 and 32MZ144 are both previously recorded historic sites which ERM revisited and recorded during the survey for the Project. Cultural material was observed at both sites as described in the updated Class III report. ERM expanded the boundaries of 32MZ2346 to encompass two previously unreported features at the site. One artifact–a commemorative coin–was collected from 32MZ2346 because of its uniqueness. No artifacts were collected from 32MZ144. Expanded descriptions of both sites are provided in the updated Class III report.	Section 5.5
o Additional survey is shown as needed near site 32MZ3278 on the maps in the overall Class III report but not in the Forest Service stand-alone report. Please include this in the stand-alone Forest Service report.	Additional survey was completed in 2020 on USFS lands in the vicinity of 32MZ3278, which was relocated. A description of the site is provided in the updated Class III report.	Section 5.5
o The recommended avoidance and fencing measures are inadequate, especially for stone feature sites.	All stone feature sites have been avoided with a minimum buffet of 50 ft. Additionally, for sites between 50 and 100 ft of Project workspace WBI Energy commits to fencing and monitoring the sites during construction. WBI Energy will provide a monitoring plan for agency review.	Section 5.5
o A monitoring plan is needed.	WBI Energy commits to providing a construction monitoring plan as discussed in the updated Class III report.	
o Updates should have been conducted for all sites, site leads, and IFs [isolated finds] regardless of whether or not they were relocated.	Site form updates have been submitted for all applicable sites, isolated finds, and site leads discussed in the report	N/A
o The discussion of site leads during fieldwork is inadequate.	Site leads are discussed in Section 5.6 of the updated Class III report.	Section 5.6
o Provide specific distances between site boundaries and the edge of the workspace.	Distances between sites and Project workspaces have been added to summary tables and site descriptions throughout the updated Class III report.	Sections 5.3 through 5.5
o Provide a map of shovel testing performed outside of site boundaries. The report explains the testing strategy during survey but never discusses or shows specifics except within site boundaries.	The route maps provided as Appendix B depict survey methodology in addition to survey coverage and results.	Appendix B
o Identify the level of tribal involvement in the survey.	Tribal participation in field surveys is discussed in Sections 4 and 5.3 through 5.5 of the updated Class III report.	Sections 4 and 5.3 through 5.5
o Discuss whether indirect effects to archaeological sites were considered.	For unevaluated sites, we have added an assessment of non-physical impacts on setting.	Sections 5.3 through 5.5

Subject: WBI Energy Transmission, Inc.
North Bakken Expansion Project – Class III Survey Reports 2020 Field Season
McKenzie, Williams, Burke, and Mountrail Counties, North Dakota
ND SHPO Ref.: 19-5593

Dear Mr. Desjalais:

Please reference WBI Energy Transmission, Inc.'s (WBI Energy's) previous correspondence regarding the above referenced project. WBI Energy proposes to construct and operate the North Bakken Expansion Project (Project) in McKenzie, Williams, Burke, and Mountrail Counties, North Dakota.

The Project is regulated by the Federal Energy Regulatory Commission (FERC) under Section 7(c) of the Natural Gas Act. Under the Energy Policy Act of 2005, FERC is the lead agency for coordinating federal authorizations and complying with the National Environmental Policy Act on natural gas pipeline projects subject to its jurisdiction. FERC similarly is the lead federal agency for complying with Section 106 of the National Historic Preservation Act (NHPA) on natural gas pipeline projects under its jurisdiction. In accordance with 36 CFR 800.2(c)(4), WBI Energy is assisting the FERC in meeting its obligations under Section 106 of the NHPA by coordinating with agencies and tribes and conducting surveys to identify historic properties that may be affected by the Project.

Enclosed for your review please find Class III survey reports for the archaeological and historic structures surveys that were conducted during the 2019 and 2020 field seasons. The archaeological report includes the results provided in the original Class III report and addresses comments that were provided by the State Historical Society of North Dakota, Bureau of Land Management, U.S. Army Corps of Engineers, and the U.S. Forest Service. The attached table summarizes our response to those comments and provides the location of the relevant revisions or clarifications. A report on geomorphological investigations is also included in this submittal.

WBI Energy would appreciate your comments on the attached reports. If you have any questions or comments on the Project or the reports, please contact me at 612-840-8976 or pat.robblee@erm.com, or Dr. Kevin Malloy at 906-285-0361 or kevin.malloy@erm.com. Please direct written correspondence to Dr. Malloy's attention at:

Environmental Resources Management
1000 IDS Center
80 South 8th Street
Minneapolis, MN 55402

Sincerely,

Patrick Robblee
Program Director

Attachment: Table summarizing agency comments on the original Class III archaeology report

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Comments from the State Historical Society of North Dakota		
General comments:		
o Provide more background information on sites with previous work. Focus on methods and reasoning for previous eligibility recommendation.	Additional information on previous investigations has been added to site descriptions, as applicable.	Sections 5.3 through 5.7
o Map symbology has item named "Shovel test – No Dig". Are these shovel probes that were planned, but not excavated for some reason? If so provide explanation.	These are planned but unexcavated shovel tests. Site descriptions have been updated, as applicable, to explain why some planned shovel tests were not excavated. Typical reasons for not excavating shovel tests include the presence of buried utilities (documented through One-Call markings) or slope.	Sections 5.3 through 5.5
Avoidance, 50 ft buffer minimum, fence, and monitor:		
o Private land: 32BK277, 32BK279, 32BK280, 32BK282, 32MZ3308, 32MZ3309, 32MZ3310, 32MZ3311, 32MZ3325, 32MZ3327, 32WI1494, 32WI1630, 32WI2144, 32WI2388, 32WI2389, 32WI2391, 32WI2392, 32WI2393, 32WI2394, 32WI2398, 32WI2406, 32WI2408.	Each of these sites is avoided with a minimum 50 ft buffer. Additionally, for sites located between 50 and 100 ft of Project workspace, WBI Energy commits to fencing and monitoring at these locations.	Section 5.3
o US Forest Service Sites: 32MZ3301, 32MZ3314, 32MZ3315, 32MZ3319, 32MZ3320, 32MZ3322, 32MZ3324.	Each of these sites is avoided with a minimum 50 ft buffer. Additionally, for sites located between 50 and 100 ft of Project workspace, WBI Energy commits to fencing and monitoring at these locations.	Section 5.5
Formally evaluate with site delineation and at least one 1x1 m TU. Submit evaluation plan prior to fieldwork:		
o Private Land: 32BK278, 32MZ3302, 32MZ3306, 32MZ3307, 32MZ3318, 32MZ3323, 32MZ3326, 32MZ3328, 32MZ3329, 32MZ3331, 32WI2390, 32WI2405, 32WI2407, 32WI2409, 32WI2410.	Additional testing (shovel testing and/or the excavation of at least one, 1 x 1 m test unit) was completed at each of these sites in accordance with a testing plan approved by the SHSND. Testing at sites 32WI2390 and 32MZ3328 was suspended following the identification of stone features at these sites; however, the pipeline route has been adjusted to avoid these sites with a minimum 50-ft buffer.	Section 5.3
o US Forest Service Site: 32MZ2346.	While ERM planned to conduct additional testing at this site, the pipeline route was modified prior to this work such that the site is now avoided by the Project with a buffer greater than 100 ft.	Section 5.5
Isolated finds:		
o Discuss subsurface potential on all IFs on a case-by-case basis. If the finds are in a good depositional context, STPs may be necessary to show that these are truly isolates. Minimal site recording may be enough to get a site number for database purposes, but more information is needed to verify that these are truly part of a category that can be written-off as not eligible.	Individual descriptions of isolated finds have been added to the text, including the results of shovel testing or an explanation for why shovel tests were not excavated.	Section 5.7

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Site-by-site comments, private land:		
o 32BK168 – Expand reasoning for Not Eligible Determination both previously and now. Newly recorded site boundary included previously unidentified features. Perhaps site should be unevaluated. Consider formal evaluation and provide updated management recommendations.	ERM conducted site testing at 32BK168 in 2020. Evidence of intact cultural deposits and features was identified during testing and the site is now recommended as eligible for listing in the NRHP. The pipeline route has been modified to avoid this site with a buffer of 57 ft.	Section 5.3
o 32MZ3323 – Discussion mentions "Better Examples" of homesteads. Provide examples.	The description for 32MZ3323 has been updated to incorporate the results of additional testing (shovel testing and the excavation of a 1 x 1 m test unit) in the updated Class III report.	Section 5.3
o 32WI1495 – Actual well shown in Figure 5.3-81 may be visible in figure 5.3-80. Is this location impacted by project? Consider site lead.	The location of the well (which is no longer extant) is discussed in the updated Class III report in conjunction with 32WI1495. ERM has submitted a site lead form for this resource. The suggested boundary of the site lead is 19 ft from Project workspace. The actual location of the well is about 235 ft from Project workspace.	Section 5.3
o 32WI2404 – How is this identified as prehistoric? Could it be a result of natural glacial and/or historic or modern field clearing? Provide evidence. Fence and monitor as necessary.	The interpretation of the feature at 32WI2404 as prehistoric is conservative and based on best professional judgement. Tribal cultural specialists who visited the site with ERM concurred with this interpretation.	Section 5.3
o 32WI2408 – Workspace is extremely close to possible graves. Is the planned route fixed?	The pipeline route has been modified to avoid this site with a buffer of 213 ft.	Section 5.3
Site-by-site comments, US Army Corps of Engineers land:		
o 32MZ976 – Drilling under site is not avoidance as leaks and emergency repairs do consider cultural resources. Formal testing or horizontal avoidance is necessary.	The trajectory of the HDD will be 160 to 180 ft below ground surface where it passes beneath 32WI976. The pipeline will carry gas, not a liquid; the gas would migrate to the surface and dissipate into the air in the event of a leak. Given the depth of the HDD installation, daylighting of the pipeline for repair would not be feasible. If repair is required in the future, the most likely course of action would be to re-install a new segment via HDD, which would require federal authorizations, thereby triggering review of the action under Section 106 of the NHPA. A description of the HDD method has been added to the description of 32WI976 in Section 5.4 of the report. Additional testing at the site is pending and scheduled to be completed this fall. The results will be discussed in an addendum report.	Section 5.4
o 32MZ976 – Show bore location and HDD line on map	A figure showing the HDD alignment with entry and exit points has been added to the description of this site as has a construction alignment sheet. The alignment sheet depicts the HDD in plan and profile.	Section 5.4

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
o 32MZ976 – Clarify and provide more evidence for geomorphological hypothesis of A horizon being related to flood deposits. Typically, A horizons show stability rather than accretional or erosional events. Provide more information on why artifacts are interpreted as disturbed rather than in primary context.	The text in the updated Class III report has been updated to address this comment. As noted above, additional testing is planned to occur at 32WI976 this fall, which will provide additional information on the soils present at the site.	Section 5.4
o 32MZ976 – Did cut bank provide additional information on buried soils? Were artifacts identified in cut bank?	The cut bank was examined during the initial survey. As noted above, additional testing is planned to occur at the site this fall with results to be discussed in an addendum report.	Section 5.4
o 32WI976 – Given size and shape of site, additional TUs recommended.		
Comments from the Bureau of Land Management		
o The recommended protection/avoidance measures for unevaluated and eligible archaeological sites in the Class III report are inadequate, particularly regarding stone feature sites. The usual avoidance distance requested/required by the BLM is 100 feet. More than 100 feet is preferred for stone feature sites. Revise protection/avoidance measures buffers for archaeological sites.	WBI Energy has routed the pipeline to avoid unevaluated and eligible sites with a minimum buffer of 50 ft as directed by the SHSND.	Sections 5.3 through 5.5
o Why were indirect effects to archaeological sites not considered? Setting is an important aspect of integrity for stone feature sites. There are numerous archaeological sites within and near the survey corridor that should be analyzed for indirect effects. Revise the report to address indirect effects to archaeological sites.	The report has been updated to include an assessment of physical and non-physical impacts on unevaluated and eligible sites.	Sections 4 and 5.5 through 5.5
o WBI Energy needs to develop a cultural resource monitoring plan for construction.	WBI Energy commits to preparing a monitoring plan for construction.	Sections 5.3 through 5.5
o Update site form for all sites, site leads, and isolated finds regardless of whether they were relocated. Even if a cultural resource could not be relocated, that is still valuable information for the next project/site visit.	Site form updates have been submitted for all sites, isolated finds, and site leads discussed in the updated Class III report	N/A
o WBI Energy should make additional efforts to involve tribes in upcoming 2020 fieldwork and field reviews.	As discussed in more detail in Section 4 of the updated Class III report, WBI Energy retained Beaver Creek Archaeology to coordinate tribal participation in fieldwork in 2020. BCA worked with tribes to document sites as cultural heritage resources. The results of that work will be presented in a separate report. Information on tribal participation in the surveys also is provided in Sections 4 and 5.3 through 5.5 of ERM's updated Class III report	Sections 4 and 5.3 through 5.5

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Comments from U.S. Army Corps of Engineers		
o In section 5.4.2, remove figures for 32MZ0598 and move to the previous section.	This comment is addressed in the updated Class III report	Section 5.4
o Figure 5.4-5: Map of Site 32WI976, provide contour lines on this map to show the slope. This information would help to explain why the shovel testing pattern appears the way it does.	Contour lines are provided on Figure 5.4-9 in the updated Class III report.	Section 5.4
o ERM, on behalf of WBI [Energy], identified a second concentration of artifacts in the western side of site 32WI0976 after they started excavating the test unit. Some additional testing is needed here as USACE cannot agree with the recommended determination for this site given the data presented in this report.	Additional testing will be completed at this site in the fall of 2020 with the results presented in an addendum report.	Section 5.4
o USACE recommends that WBI [Energy] conduct a remote sensing evaluation (gradiometer or conductivity) at site 32WI0976. This would be the best way to produce measurable data regarding the presence/absence of subsurface features at the site.	A remote sensing survey of the site was completed in the summer of 2020. The results of the survey were used to prepare a testing plan for 32WI976. Additional testing at the site will occur this fall with the results presented in an addendum report.	Section 5.4
Comments from the U.S. Forest Service		
o The map showing previously recorded cultural resources within a one-mile radius is only included in the overall Class III and not in the Forest Service stand-alone report. Please include this in the stand-alone Forest Service report.	This comment is no longer applicable. Survey results for USFS lands are included in the updated Class III inventory report in Section 5.5.	N/A
o Figure 1.1-2 shows the Forest Service surface and differentiates between the survey corridor and the survey corridor on Forest Service surface; however, the survey corridor on Forest Service surface and the actual Forest Service surface displayed don't match.	This comment is no longer applicable. Survey results for USFS lands are included in the updated Class III inventory report in Section 5.5.	N/A
o Sites 32MZ2347 (Historical Archaeological) and 32MZ3278 (Cairn) are located immediately adjacent to the survey corridor but are not discussed. Please discuss.	Based on route modifications, 32MZ3278 was visited in 2020 and the site boundary expanded based on the findings. A discussion of the site is provided in the updated Class III report. 32MZ2347 is outside the inventory corridor for the Project; however, we have included a discussion of this site in the Class III inventory report.	Section 5.5
o Site 32MZ145 site form update does not appear to have been performed. Why? Was an attempt made to actually relocate the site? Also, according to the site form, a THPO representative requested avoidance in 2013. More work on this site is probably needed.	When 32MZ145 was first recorded in 1979, it was characterized as two stone cairns. Subsequent investigations described the site as consisting of a single historic rock clearing pile on the west side of Highway 1806, noting that the second pile was likely destroyed by construction of the highway. ERM's survey in 2019 was limited to the east side of Highway 1806, which explains why we did not relocate the site at that time. In 2020, ERM conducted additional survey on USFS lands, examining a corridor on the west side of Highway 1806. 32MZ145 was relocated as a result of this work. The site is discussed in the updated Class III report. Tribal cultural specialists who accompanied ERM during the 2020 field investigation concurred that 32MZ145 is historic rock clearing pile.	Section 5.5

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
o Site 32MZ2346 and 32MZ144: it is very improbable and therefore suspicious that there are zero artifacts and one artifact respectively at sites with historic dumps.	Sites 32MZ2346 and 32MZ144 are both previously recorded historic sites which ERM revisited and recorded during the survey for the Project. Cultural material was observed at both sites as described in the updated Class III report. ERM expanded the boundaries of 32MZ2346 to encompass two previously unreported features at the site. To: pcoffey@mhanation.com
Cc: Jayson Zoino
Subject: North Bakken Project - Site 32MZ3313

Mr. Coffey,

Andy Clark at the SHSND has directed ERM to send you the bone fragments recovered from 32MZ3313 in 2019 for reburial at the site. An ERM survey team will be mobilizing to the project area at the end of next week for an approximately two week deployment. Would you be available the week of 9/14 or 9/21 for us to hand deliver the bone fragments to your office? Alternatively, we could Fed Ex the fragments to your office. We also have all of the lithic artifacts recovered from the site.

Thank you.

Subject: WBI Energy Transmission, Inc.
North Bakken Expansion Project – Class III Survey Reports 2020 Field Season
McKenzie, Williams, Burke, and Mountrail Counties, North Dakota
ND SHPO Ref.: 19-5593

Dear Mr. Coffey:

Please reference WBI Energy Transmission, Inc.'s (WBI Energy's) previous correspondence regarding the above referenced project. WBI Energy proposes to construct and operate the North Bakken Expansion Project (Project) in McKenzie, Williams, Burke, and Mountrail Counties, North Dakota.

The Project is regulated by the Federal Energy Regulatory Commission (FERC) under Section 7(c) of the Natural Gas Act. Under the Energy Policy Act of 2005, FERC is the lead agency for coordinating federal authorizations and complying with the National Environmental Policy Act on natural gas pipeline projects subject to its jurisdiction. FERC similarly is the lead federal agency for complying with Section 106 of the National Historic Preservation Act (NHPA) on natural gas pipeline projects under its jurisdiction. In accordance with 36 CFR 800.2(c)(4), WBI Energy is assisting the FERC in meeting its obligations under Section 106 of the NHPA by coordinating with agencies and tribes and conducting surveys to identify historic properties that may be affected by the Project.

Enclosed for your review please find Class III survey reports for the archaeological and historic structures surveys that were conducted during the 2019 and 2020 field seasons. The archaeological report includes the results provided in the original Class III report and addresses comments that were provided by the State Historical Society of North Dakota, Bureau of Land Management, U.S. Army Corps of Engineers, and the U.S. Forest Service. The attached table summarizes our response to those comments and provides the location of the relevant revisions or clarifications. A report on geomorphological investigations is also included in this submittal.

WBI Energy would appreciate your comments on the attached reports. If you have any questions or comments on the Project or the reports, please contact me at 612-840-8976 or pat.robblee@erm.com, or Dr. Kevin Malloy at 906-285-0361 or kevin.malloy@erm.com. Please direct written correspondence to Dr. Malloy's attention at:

Attachment: Table summarizing agency comments on the original Class III archaeology report

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Comments from the State Historical Society of North Dakota		
General comments:		
o Provide more background information on sites with previous work. Focus on methods and reasoning for previous eligibility recommendation.	Additional information on previous investigations has been added to site descriptions, as applicable.	Sections 5.3 through 5.7
o Map symbology has item named "Shovel test – No Dig". Are these shovel probes that were planned, but not excavated for some reason? If so provide explanation.	These are planned but unexcavated shovel tests. Site descriptions have been updated, as applicable, to explain why some planned shovel tests were not excavated. Typical reasons for not excavating shovel tests include the presence of buried utilities (documented through One-Call markings) or slope.	Sections 5.3 through 5.5
Avoidance, 50 ft buffer minimum, fence, and monitor:		
o Private land: 32BK277, 32BK279, 32BK280, 32BK282, 32MZ3308, 32MZ3309, 32MZ3310, 32MZ3311, 32MZ3325, 32MZ3327, 32WI1494, 32WI1630, 32WI2144, 32WI2388, 32WI2389, 32WI2391, 32WI2392, 32WI2393, 32WI2394, 32WI2398, 32WI2406, 32WI2408.	Each of these sites is avoided with a minimum 50 ft buffer. Additionally, for sites located between 50 and 100 ft of Project workspace, WBI Energy commits to fencing and monitoring at these locations.	Section 5.3
o US Forest Service Sites: 32MZ3301, 32MZ3314, 32MZ3315, 32MZ3319, 32MZ3320, 32MZ3322, 32MZ3324.	Each of these sites is avoided with a minimum 50 ft buffer. Additionally, for sites located between 50 and 100 ft of Project workspace, WBI Energy commits to fencing and monitoring at these locations.	Section 5.5
Formally evaluate with site delineation and at least one 1x1 m TU. Submit evaluation plan prior to fieldwork:		
o Private Land: 32BK278, 32MZ3302, 32MZ3306, 32MZ3307, 32MZ3318, 32MZ3323, 32MZ3326, 32MZ3328, 32MZ3329, 32MZ3331, 32WI2390, 32WI2405, 32WI2407, 32WI2409, 32WI2410.	Additional testing (shovel testing and/or the excavation of at least one, 1 x 1 m test unit) was completed at each of these sites in accordance with a testing plan approved by the SHSND. Testing at sites 32WI2390 and 32MZ3328 was suspended following the identification of stone features at these sites; however, the pipeline route has been adjusted to avoid these sites with a minimum 50-ft buffer.	Section 5.3
o US Forest Service Site: 32MZ2346.	While ERM planned to conduct additional testing at this site, the pipeline route was modified prior to this work such that the site is now avoided by the Project with a buffer greater than 100 ft.	Section 5.5
Isolated finds:		
o Discuss subsurface potential on all IFs on a case-by-case basis. If the finds are in a good depositional context, STPs may be necessary to show that these are truly isolates. Minimal site recording may be enough to get a site number for database purposes, but more information is needed to verify that these are truly part of a category that can be written-off as not eligible.	Individual descriptions of isolated finds have been added to the text, including the results of shovel testing or an explanation for why shovel tests were not excavated.	Section 5.7

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Site-by-site comments, private land:		
o 32BK168 – Expand reasoning for Not Eligible Determination both previously and now. Newly recorded site boundary included previously unidentified features. Perhaps site should be unevaluated. Consider formal evaluation and provide updated management recommendations.	ERM conducted site testing at 32BK168 in 2020. Evidence of intact cultural deposits and features was identified during testing and the site is now recommended as eligible for listing in the NRHP. The pipeline route has been modified to avoid this site with a buffer of 57 ft.	Section 5.3
o 32MZ3323 – Discussion mentions "Better Examples" of homesteads. Provide examples.	The description for 32MZ3323 has been updated to incorporate the results of additional testing (shovel testing and the excavation of a 1 x 1 m test unit) in the updated Class III report.	Section 5.3
o 32WI1495 – Actual well shown in Figure 5.3-81 may be visible in figure 5.3-80. Is this location impacted by project? Consider site lead.	The location of the well (which is no longer extant) is discussed in the updated Class III report in conjunction with 32WI1495. ERM has submitted a site lead form for this resource. The suggested boundary of the site lead is 19 ft from Project workspace. The actual location of the well is about 235 ft from Project workspace.	Section 5.3
o 32WI2404 – How is this identified as prehistoric? Could it be a result of natural glacial and/or historic or modern field clearing? Provide evidence. Fence and monitor as necessary.	The interpretation of the feature at 32WI2404 as prehistoric is conservative and based on best professional judgement. Tribal cultural specialists who visited the site with ERM concurred with this interpretation.	Section 5.3
o 32WI2408 – Workspace is extremely close to possible graves. Is the planned route fixed?	The pipeline route has been modified to avoid this site with a buffer of 213 ft.	Section 5.3
Site-by-site comments, US Army Corps of Engineers land:		
o 32MZ976 – Drilling under site is not avoidance as leaks and emergency repairs do consider cultural resources. Formal testing or horizontal avoidance is necessary.	The trajectory of the HDD will be 160 to 180 ft below ground surface where it passes beneath 32WI976. The pipeline will carry gas, not a liquid; the gas would migrate to the surface and dissipate into the air in the event of a leak. Given the depth of the HDD installation, daylighting of the pipeline for repair would not be feasible. If repair is required in the future, the most likely course of action would be to re-install a new segment via HDD, which would require federal authorizations, thereby triggering review of the action under Section 106 of the NHPA. A description of the HDD method has been added to the description of 32WI976 in Section 5.4 of the report. Additional testing at the site is pending and scheduled to be completed this fall. The results will be discussed in an addendum report.	Section 5.4
o 32MZ976 – Show bore location and HDD line on map	A figure showing the HDD alignment with entry and exit points has been added to the description of this site as has a construction alignment sheet. The alignment sheet depicts the HDD in plan and profile.	Section 5.4

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
o 32MZ976 – Clarify and provide more evidence for geomorphological hypothesis of A horizon being related to flood deposits. Typically, A horizons show stability rather than accretional or erosional events. Provide more information on why artifacts are interpreted as disturbed rather than in primary context.	The text in the updated Class III report has been updated to address this comment. As noted above, additional testing is planned to occur at 32WI976 this fall, which will provide additional information on the soils present at the site.	Section 5.4
o 32MZ976 – Did cut bank provide additional information on buried soils? Were artifacts identified in cut bank?	The cut bank was examined during the initial survey. As noted above, additional testing is planned to occur at the site this fall with results to be discussed in an addendum report.	Section 5.4
o 32WI976 – Given size and shape of site, additional TUs recommended.		
Comments from the Bureau of Land Management		
o The recommended protection/avoidance measures for unevaluated and eligible archaeological sites in the Class III report are inadequate, particularly regarding stone feature sites. The usual avoidance distance requested/required by the BLM is 100 feet. More than 100 feet is preferred for stone feature sites. Revise protection/avoidance measures buffers for archaeological sites.	WBI Energy has routed the pipeline to avoid unevaluated and eligible sites with a minimum buffer of 50 ft as directed by the SHSND.	Sections 5.3 through 5.5
o Why were indirect effects to archaeological sites not considered? Setting is an important aspect of integrity for stone feature sites. There are numerous archaeological sites within and near the survey corridor that should be analyzed for indirect effects. Revise the report to address indirect effects to archaeological sites.	The report has been updated to include an assessment of physical and non-physical impacts on unevaluated and eligible sites.	Sections 4 and 5.5 through 5.5
o WBI Energy needs to develop a cultural resource monitoring plan for construction.	WBI Energy commits to preparing a monitoring plan for construction.	Sections 5.3 through 5.5
o Update site form for all sites, site leads, and isolated finds regardless of whether they were relocated. Even if a cultural resource could not be relocated, that is still valuable information for the next project/site visit.	Site form updates have been submitted for all sites, isolated finds, and site leads discussed in the updated Class III report	N/A
o WBI Energy should make additional efforts to involve tribes in upcoming 2020 fieldwork and field reviews.	As discussed in more detail in Section 4 of the updated Class III report, WBI Energy retained Beaver Creek Archaeology to coordinate tribal participation in fieldwork in 2020. BCA worked with tribes to document sites as cultural heritage resources. The results of that work will be presented in a separate report. Information on tribal participation in the surveys also is provided in Sections 4 and 5.3 through 5.5 of ERM's updated Class III report	Sections 4 and 5.3 through 5.5

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Comments from U.S. Army Corps of Engineers		
o In section 5.4.2, remove figures for 32MZ0598 and move to the previous section.	This comment is addressed in the updated Class III report	Section 5.4
o Figure 5.4-5: Map of Site 32WI976, provide contour lines on this map to show the slope. This information would help to explain why the shovel testing pattern appears the way it does.	Contour lines are provided on Figure 5.4-9 in the updated Class III report.	Section 5.4
o ERM, on behalf of WBI [Energy], identified a second concentration of artifacts in the western side of site 32WI0976 after they started excavating the test unit. Some additional testing is needed here as USACE cannot agree with the recommended determination for this site given the data presented in this report.	Additional testing will be completed at this site in the fall of 2020 with the results presented in an addendum report.	Section 5.4
o USACE recommends that WBI [Energy] conduct a remote sensing evaluation (gradiometer or conductivity) at site 32WI0976. This would be the best way to produce measurable data regarding the presence/absence of subsurface features at the site.	A remote sensing survey of the site was completed in the summer of 2020. The results of the survey were used to prepare a testing plan for 32WI976. Additional testing at the site will occur this fall with the results presented in an addendum report.	Section 5.4
Comments from the U.S. Forest Service		
o The map showing previously recorded cultural resources within a one-mile radius is only included in the overall Class III and not in the Forest Service stand-alone report. Please include this in the stand-alone Forest Service report.	This comment is no longer applicable. Survey results for USFS lands are included in the updated Class III inventory report in Section 5.5.	N/A
o Figure 1.1-2 shows the Forest Service surface and differentiates between the survey corridor and the survey corridor on Forest Service surface; however, the survey corridor on Forest Service surface and the actual Forest Service surface displayed don't match.	This comment is no longer applicable. Survey results for USFS lands are included in the updated Class III inventory report in Section 5.5.	N/A
o Sites 32MZ2347 (Historical Archaeological) and 32MZ3278 (Cairn) are located immediately adjacent to the survey corridor but are not discussed. Please discuss.	Based on route modifications, 32MZ3278 was visited in 2020 and the site boundary expanded based on the findings. A discussion of the site is provided in the updated Class III report. 32MZ2347 is outside the inventory corridor for the Project; however, we have included a discussion of this site in the Class III inventory report.	Section 5.5
o Site 32MZ145 site form update does not appear to have been performed. Why? Was an attempt made to actually relocate the site? Also, according to the site form, a THPO representative requested avoidance in 2013. More work on this site is probably needed.	When 32MZ145 was first recorded in 1979, it was characterized as two stone cairns. Subsequent investigations described the site as consisting of a single historic rock clearing pile on the west side of Highway 1806, noting that the second pile was likely destroyed by construction of the highway. ERM's survey in 2019 was limited to the east side of Highway 1806, which explains why we did not relocate the site at that time. In 2020, ERM conducted additional survey on USFS lands, examining a corridor on the west side of Highway 1806. 32MZ145 was relocated as a result of this work. The site is discussed in the updated Class III report. Tribal cultural specialists who accompanied ERM during the 2020 field investigation concurred that 32MZ145 is historic rock clearing pile.	Section 5.5

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
o Site 32MZ2346 and 32MZ144: it is very improbable and therefore suspicious that there are zero artifacts and one artifact respectively at sites with historic dumps.	Sites 32MZ2346 and 32MZ144 are both previously recorded historic sites which ERM revisited and recorded during the survey for the Project. Cultural material was observed at both sites as described in the updated Class III report. ERM expanded the boundaries of 32MZ2346 to encompass two previously unreported features at the site. One artifact–a commemorative coin–was collected from 32MZ2346 because of its uniqueness. No artifacts were collected from 32MZ144. Expanded descriptions of both sites are provided in the updated Class III report.	Section 5.5
o Additional survey is shown as needed near site 32MZ3278 on the maps in the overall Class III report but not in the Forest Service stand-alone report. Please include this in the stand-alone Forest Service report.	Additional survey was completed in 2020 on USFS lands in the vicinity of 32MZ3278, which was relocated. A description of the site is provided in the updated Class III report.	Section 5.5
o The recommended avoidance and fencing measures are inadequate, especially for stone feature sites.	All stone feature sites have been avoided with a minimum buffet of 50 ft. Additionally, for sites between 50 and 100 ft of Project workspace WBI Energy commits to fencing and monitoring the sites during construction. WBI Energy will provide a monitoring plan for agency review.	Section 5.5
o A monitoring plan is needed.	WBI Energy commits to providing a construction monitoring plan as discussed in the updated Class III report.	
o Updates should have been conducted for all sites, site leads, and IFs [isolated finds] regardless of whether or not they were relocated.	Site form updates have been submitted for all applicable sites, isolated finds, and site leads discussed in the report	N/A
o The discussion of site leads during fieldwork is inadequate.	Site leads are discussed in Section 5.6 of the updated Class III report.	Section 5.6
o Provide specific distances between site boundaries and the edge of the workspace.	Distances between sites and Project workspaces have been added to summary tables and site descriptions throughout the updated Class III report.	Sections 5.3 through 5.5
o Provide a map of shovel testing performed outside of site boundaries. The report explains the testing strategy during survey but never discusses or shows specifics except within site boundaries.	The route maps provided as Appendix B depict survey methodology in addition to survey coverage and results.	Appendix B
o Identify the level of tribal involvement in the survey.	Tribal participation in field surveys is discussed in Sections 4 and 5.3 through 5.5 of the updated Class III report.	Sections 4 and 5.3 through 5.5
o Discuss whether indirect effects to archaeological sites were considered.	For unevaluated sites, we have added an assessment of non-physical impacts on setting.	Sections 5.3 through 5.5

Dr. Erich Longie, Tribal Historic Preservation Officer
Spirit Lake Tribe
PO Box 76
Fort Totten, ND 58335

Subject: WBI Energy Transmission, Inc.
North Bakken Expansion Project – Class III Survey Reports 2020 Field Season
McKenzie, Williams, Burke, and Mountrail Counties, North Dakota
ND SHPO Ref.: 19-5593

Dear Dr. Longie:

Please reference WBI Energy Transmission, Inc.'s (WBI Energy's) previous correspondence regarding the above referenced project. WBI Energy proposes to construct and operate the North Bakken Expansion Project (Project) in McKenzie, Williams, Burke, and Mountrail Counties, North Dakota.

The Project is regulated by the Federal Energy Regulatory Commission (FERC) under Section 7(c) of the Natural Gas Act. Under the Energy Policy Act of 2005, FERC is the lead agency for coordinating federal authorizations and complying with the National Environmental Policy Act on natural gas pipeline projects subject to its jurisdiction. FERC similarly is the lead federal agency for complying with Section 106 of the National Historic Preservation Act (NHPA) on natural gas pipeline projects under its jurisdiction. In accordance with 36 CFR 800.2(c)(4), WBI Energy is assisting the FERC in meeting its obligations under Section 106 of the NHPA by coordinating with agencies and tribes and conducting surveys to identify historic properties that may be affected by the Project. A report on geomorphological investigations is also included in this submittal.

Enclosed for your review please find Class III survey reports for the archaeological and historic structures surveys that were conducted during the 2019 and 2020 field seasons. The archaeological report includes the results provided in the original Class III report and addresses comments that were provided by the State Historical Society of North Dakota, Bureau of Land Management, U.S. Army Corps of Engineers, and the U.S. Forest Service. The attached table summarizes our response to those comments and provides the location of the relevant revisions or clarifications.

WBI Energy would appreciate your comments on the attached reports. If you have any questions or comments on the Project or the reports, please contact me at 612-840-8976 or pat.robblee@erm.com, or Dr. Kevin Malloy at 906-285-0361 or kevin.malloy@erm.com. Please direct written correspondence to Dr. Malloy's attention at:

Attachment: Table summarizing agency comments on the original Class III archaeology report

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Comments from the State Historical Society of North Dakota		
General comments:		
o Provide more background information on sites with previous work. Focus on methods and reasoning for previous eligibility recommendation.	Additional information on previous investigations has been added to site descriptions, as applicable.	Sections 5.3 through 5.7
o Map symbology has item named "Shovel test – No Dig". Are these shovel probes that were planned, but not excavated for some reason? If so provide explanation.	These are planned but unexcavated shovel tests. Site descriptions have been updated, as applicable, to explain why some planned shovel tests were not excavated. Typical reasons for not excavating shovel tests include the presence of buried utilities (documented through One-Call markings) or slope.	Sections 5.3 through 5.5
Avoidance, 50 ft buffer minimum, fence, and monitor:		
o Private land: 32BK277, 32BK279, 32BK280, 32BK282, 32MZ3308, 32MZ3309, 32MZ3310, 32MZ3311, 32MZ3325, 32MZ3327, 32WI1494, 32WI1630, 32WI2144, 32WI2388, 32WI2389, 32WI2391, 32WI2392, 32WI2393, 32WI2394, 32WI2398, 32WI2406, 32WI2408.	Each of these sites is avoided with a minimum 50 ft buffer. Additionally, for sites located between 50 and 100 ft of Project workspace, WBI Energy commits to fencing and monitoring at these locations.	Section 5.3
o US Forest Service Sites: 32MZ3301, 32MZ3314, 32MZ3315, 32MZ3319, 32MZ3320, 32MZ3322, 32MZ3324.	Each of these sites is avoided with a minimum 50 ft buffer. Additionally, for sites located between 50 and 100 ft of Project workspace, WBI Energy commits to fencing and monitoring at these locations.	Section 5.5
Formally evaluate with site delineation and at least one 1x1 m TU. Submit evaluation plan prior to fieldwork:		
o Private Land: 32BK278, 32MZ3302, 32MZ3306, 32MZ3307, 32MZ3318, 32MZ3323, 32MZ3326, 32MZ3328, 32MZ3329, 32MZ3331, 32WI2390, 32WI2405, 32WI2407, 32WI2409, 32WI2410.	Additional testing (shovel testing and/or the excavation of at least one, 1 x 1 m test unit) was completed at each of these sites in accordance with a testing plan approved by the SHSND. Testing at sites 32WI2390 and 32MZ3328 was suspended following the identification of stone features at these sites; however, the pipeline route has been adjusted to avoid these sites with a minimum 50-ft buffer.	Section 5.3
o US Forest Service Site: 32MZ2346.	While ERM planned to conduct additional testing at this site, the pipeline route was modified prior to this work such that the site is now avoided by the Project with a buffer greater than 100 ft.	Section 5.5
Isolated finds:		
o Discuss subsurface potential on all IFs on a case-by-case basis. If the finds are in a good depositional context, STPs may be necessary to show that these are truly isolates. Minimal site recording may be enough to get a site number for database purposes, but more information is needed to verify that these are truly part of a category that can be written-off as not eligible.	Individual descriptions of isolated finds have been added to the text, including the results of shovel testing or an explanation for why shovel tests were not excavated.	Section 5.7

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Site-by-site comments, private land:		
o 32BK168 – Expand reasoning for Not Eligible Determination both previously and now. Newly recorded site boundary included previously unidentified features. Perhaps site should be unevaluated. Consider formal evaluation and provide updated management recommendations.	ERM conducted site testing at 32BK168 in 2020. Evidence of intact cultural deposits and features was identified during testing and the site is now recommended as eligible for listing in the NRHP. The pipeline route has been modified to avoid this site with a buffer of 57 ft.	Section 5.3
o 32MZ3323 – Discussion mentions "Better Examples" of homesteads. Provide examples.	The description for 32MZ3323 has been updated to incorporate the results of additional testing (shovel testing and the excavation of a 1 x 1 m test unit) in the updated Class III report.	Section 5.3
o 32WI1495 – Actual well shown in Figure 5.3-81 may be visible in figure 5.3-80. Is this location impacted by project? Consider site lead.	The location of the well (which is no longer extant) is discussed in the updated Class III report in conjunction with 32WI1495. ERM has submitted a site lead form for this resource. The suggested boundary of the site lead is 19 ft from Project workspace. The actual location of the well is about 235 ft from Project workspace.	Section 5.3
o 32WI2404 – How is this identified as prehistoric? Could it be a result of natural glacial and/or historic or modern field clearing? Provide evidence. Fence and monitor as necessary.	The interpretation of the feature at 32WI2404 as prehistoric is conservative and based on best professional judgement. Tribal cultural specialists who visited the site with ERM concurred with this interpretation.	Section 5.3
o 32WI2408 – Workspace is extremely close to possible graves. Is the planned route fixed?	The pipeline route has been modified to avoid this site with a buffer of 213 ft.	Section 5.3
Site-by-site comments, US Army Corps of Engineers land:		
o 32MZ976 – Drilling under site is not avoidance as leaks and emergency repairs do consider cultural resources. Formal testing or horizontal avoidance is necessary.	The trajectory of the HDD will be 160 to 180 ft below ground surface where it passes beneath 32WI976. The pipeline will carry gas, not a liquid; the gas would migrate to the surface and dissipate into the air in the event of a leak. Given the depth of the HDD installation, daylighting of the pipeline for repair would not be feasible. If repair is required in the future, the most likely course of action would be to re-install a new segment via HDD, which would require federal authorizations, thereby triggering review of the action under Section 106 of the NHPA. A description of the HDD method has been added to the description of 32WI976 in Section 5.4 of the report. Additional testing at the site is pending and scheduled to be completed this fall. The results will be discussed in an addendum report.	Section 5.4
o 32MZ976 – Show bore location and HDD line on map	A figure showing the HDD alignment with entry and exit points has been added to the description of this site as has a construction alignment sheet. The alignment sheet depicts the HDD in plan and profile.	Section 5.4

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
o 32MZ976 – Clarify and provide more evidence for geomorphological hypothesis of A horizon being related to flood deposits. Typically, A horizons show stability rather than accretional or erosional events. Provide more information on why artifacts are interpreted as disturbed rather than in primary context.	The text in the updated Class III report has been updated to address this comment. As noted above, additional testing is planned to occur at 32WI976 this fall, which will provide additional information on the soils present at the site.	Section 5.4
o 32MZ976 – Did cut bank provide additional information on buried soils? Were artifacts identified in cut bank?	The cut bank was examined during the initial survey. As noted above, additional testing is planned to occur at the site this fall with results to be discussed in an addendum report.	Section 5.4
o 32WI976 – Given size and shape of site, additional TUs recommended.		
Comments from the Bureau of Land Management		
o The recommended protection/avoidance measures for unevaluated and eligible archaeological sites in the Class III report are inadequate, particularly regarding stone feature sites. The usual avoidance distance requested/required by the BLM is 100 feet. More than 100 feet is preferred for stone feature sites. Revise protection/avoidance measures buffers for archaeological sites.	WBI Energy has routed the pipeline to avoid unevaluated and eligible sites with a minimum buffer of 50 ft as directed by the SHSND.	Sections 5.3 through 5.5
o Why were indirect effects to archaeological sites not considered? Setting is an important aspect of integrity for stone feature sites. There are numerous archaeological sites within and near the survey corridor that should be analyzed for indirect effects. Revise the report to address indirect effects to archaeological sites.	The report has been updated to include an assessment of physical and non-physical impacts on unevaluated and eligible sites.	Sections 4 and 5.5 through 5.5
o WBI Energy needs to develop a cultural resource monitoring plan for construction.	WBI Energy commits to preparing a monitoring plan for construction.	Sections 5.3 through 5.5
o Update site form for all sites, site leads, and isolated finds regardless of whether they were relocated. Even if a cultural resource could not be relocated, that is still valuable information for the next project/site visit.	Site form updates have been submitted for all sites, isolated finds, and site leads discussed in the updated Class III report	N/A
o WBI Energy should make additional efforts to involve tribes in upcoming 2020 fieldwork and field reviews.	As discussed in more detail in Section 4 of the updated Class III report, WBI Energy retained Beaver Creek Archaeology to coordinate tribal participation in fieldwork in 2020. BCA worked with tribes to document sites as cultural heritage resources. The results of that work will be presented in a separate report. Information on tribal participation in the surveys also is provided in Sections 4 and 5.3 through 5.5 of ERM's updated Class III report	Sections 4 and 5.3 through 5.5

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Comments from U.S. Army Corps of Engineers		
o In section 5.4.2, remove figures for 32MZ0598 and move to the previous section.	This comment is addressed in the updated Class III report	Section 5.4
o Figure 5.4-5: Map of Site 32WI976, provide contour lines on this map to show the slope. This information would help to explain why the shovel testing pattern appears the way it does.	Contour lines are provided on Figure 5.4-9 in the updated Class III report.	Section 5.4
o ERM, on behalf of WBI [Energy], identified a second concentration of artifacts in the western side of site 32WI0976 after they started excavating the test unit. Some additional testing is needed here as USACE cannot agree with the recommended determination for this site given the data presented in this report.	Additional testing will be completed at this site in the fall of 2020 with the results presented in an addendum report.	Section 5.4
o USACE recommends that WBI [Energy] conduct a remote sensing evaluation (gradiometer or conductivity) at site 32WI0976. This would be the best way to produce measurable data regarding the presence/absence of subsurface features at the site.	A remote sensing survey of the site was completed in the summer of 2020. The results of the survey were used to prepare a testing plan for 32WI976. Additional testing at the site will occur this fall with the results presented in an addendum report.	Section 5.4
Comments from the U.S. Forest Service		
o The map showing previously recorded cultural resources within a one-mile radius is only included in the overall Class III and not in the Forest Service stand-alone report. Please include this in the stand-alone Forest Service report.	This comment is no longer applicable. Survey results for USFS lands are included in the updated Class III inventory report in Section 5.5.	N/A
o Figure 1.1-2 shows the Forest Service surface and differentiates between the survey corridor and the survey corridor on Forest Service surface; however, the survey corridor on Forest Service surface and the actual Forest Service surface displayed don't match.	This comment is no longer applicable. Survey results for USFS lands are included in the updated Class III inventory report in Section 5.5.	N/A
o Sites 32MZ2347 (Historical Archaeological) and 32MZ3278 (Cairn) are located immediately adjacent to the survey corridor but are not discussed. Please discuss.	Based on route modifications, 32MZ3278 was visited in 2020 and the site boundary expanded based on the findings. A discussion of the site is provided in the updated Class III report. 32MZ2347 is outside the inventory corridor for the Project; however, we have included a discussion of this site in the Class III inventory report.	Section 5.5
o Site 32MZ145 site form update does not appear to have been performed. Why? Was an attempt made to actually relocate the site? Also, according to the site form, a THPO representative requested avoidance in 2013. More work on this site is probably needed.	When 32MZ145 was first recorded in 1979, it was characterized as two stone cairns. Subsequent investigations described the site as consisting of a single historic rock clearing pile on the west side of Highway 1806, noting that the second pile was likely destroyed by construction of the highway. ERM's survey in 2019 was limited to the east side of Highway 1806, which explains why we did not relocate the site at that time. In 2020, ERM conducted additional survey on USFS lands, examining a corridor on the west side of Highway 1806. 32MZ145 was relocated as a result of this work. The site is discussed in the updated Class III report. Tribal cultural specialists who accompanied ERM during the 2020 field investigation concurred that 32MZ145 is historic rock clearing pile.	Section 5.5

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
o Site 32MZ2346 and 32MZ144: it is very improbable and therefore suspicious that there are zero artifacts and one artifact respectively at sites with historic dumps.	Sites 32MZ2346 and 32MZ144 are both previously recorded historic sites which ERM revisited and recorded during the survey for the Project. Cultural material was observed at both sites as described in the updated Class III report. ERM expanded the boundaries of 32MZ2346 to encompass two previously unreported features at the site. One artifact–a commemorative coin–was collected from 32MZ2346 because of its uniqueness. No artifacts were collected from 32MZ144. Expanded descriptions of both sites are provided in the updated Class III report.	Section 5.5
o Additional survey is shown as needed near site 32MZ3278 on the maps in the overall Class III report but not in the Forest Service stand-alone report. Please include this in the stand-alone Forest Service report.	Additional survey was completed in 2020 on USFS lands in the vicinity of 32MZ3278, which was relocated. A description of the site is provided in the updated Class III report.	Section 5.5
o The recommended avoidance and fencing measures are inadequate, especially for stone feature sites.	All stone feature sites have been avoided with a minimum buffet of 50 ft. Additionally, for sites between 50 and 100 ft of Project workspace WBI Energy commits to fencing and monitoring the sites during construction. WBI Energy will provide a monitoring plan for agency review.	Section 5.5
o A monitoring plan is needed.	WBI Energy commits to providing a construction monitoring plan as discussed in the updated Class III report.	
o Updates should have been conducted for all sites, site leads, and IFs [isolated finds] regardless of whether or not they were relocated.	Site form updates have been submitted for all applicable sites, isolated finds, and site leads discussed in the report	N/A
o The discussion of site leads during fieldwork is inadequate.	Site leads are discussed in Section 5.6 of the updated Class III report.	Section 5.6
o Provide specific distances between site boundaries and the edge of the workspace.	Distances between sites and Project workspaces have been added to summary tables and site descriptions throughout the updated Class III report.	Sections 5.3 through 5.5
o Provide a map of shovel testing performed outside of site boundaries. The report explains the testing strategy during survey but never discusses or shows specifics except within site boundaries.	The route maps provided as Appendix B depict survey methodology in addition to survey coverage and results.	Appendix B
o Identify the level of tribal involvement in the survey.	Tribal participation in field surveys is discussed in Sections 4 and 5.3 through 5.5 of the updated Class III report.	Sections 4 and 5.3 through 5.5
o Discuss whether indirect effects to archaeological sites were considered.	For unevaluated sites, we have added an assessment of non-physical impacts on setting.	Sections 5.3 through 5.5

Subject: WBI Energy Transmission, Inc.
North Bakken Expansion Project – Class III Survey Reports 2020 Field Season
McKenzie, Williams, Burke, and Mountrail Counties, North Dakota
ND SHPO Ref.: 19-5593

Dear Mr. Spotted Eagle:

Please reference WBI Energy Transmission, Inc.'s (WBI Energy's) previous correspondence regarding the above referenced project. WBI Energy proposes to construct and operate the North Bakken Expansion Project (Project) in McKenzie, Williams, Burke, and Mountrail Counties, North Dakota.

The Project is regulated by the Federal Energy Regulatory Commission (FERC) under Section 7(c) of the Natural Gas Act. Under the Energy Policy Act of 2005, FERC is the lead agency for coordinating federal authorizations and complying with the National Environmental Policy Act on natural gas pipeline projects subject to its jurisdiction. FERC similarly is the lead federal agency for complying with Section 106 of the National Historic Preservation Act (NHPA) on natural gas pipeline projects under its jurisdiction. In accordance with 36 CFR 800.2(c)(4), WBI Energy is assisting the FERC in meeting its obligations under Section 106 of the NHPA by coordinating with agencies and tribes and conducting surveys to identify historic properties that may be affected by the Project. A report on geomorphological investigations is also included in this submittal.

Enclosed for your review please find Class III survey reports for the archaeological and historic structures surveys that were conducted during the 2019 and 2020 field seasons. The archaeological report includes the results provided in the original Class III report and addresses comments that were provided by the State Historical Society of North Dakota, Bureau of Land Management, U.S. Army Corps of Engineers, and the U.S. Forest Service. The attached table summarizes our response to those comments and provides the location of the relevant revisions or clarifications.

WBI Energy would appreciate your comments on the attached reports. If you have any questions or comments on the Project or the reports, please contact me at 612-840-8976 or pat.robblee@erm.com, or Dr. Kevin Malloy at 906-285-0361 or kevin.malloy@erm.com. Please direct written correspondence to Dr. Malloy's attention at:

Attachment: Table summarizing agency comments on the original Class III archaeology report

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Comments from the State Historical Society of North Dakota		
General comments:		
o Provide more background information on sites with previous work. Focus on methods and reasoning for previous eligibility recommendation.	Additional information on previous investigations has been added to site descriptions, as applicable.	Sections 5.3 through 5.7
o Map symbology has item named "Shovel test – No Dig". Are these shovel probes that were planned, but not excavated for some reason? If so provide explanation.	These are planned but unexcavated shovel tests. Site descriptions have been updated, as applicable, to explain why some planned shovel tests were not excavated. Typical reasons for not excavating shovel tests include the presence of buried utilities (documented through One-Call markings) or slope.	Sections 5.3 through 5.5
Avoidance, 50 ft buffer minimum, fence, and monitor:		
o Private land: 32BK277, 32BK279, 32BK280, 32BK282, 32MZ3308, 32MZ3309, 32MZ3310, 32MZ3311, 32MZ3325, 32MZ3327, 32WI1494, 32WI1630, 32WI2144, 32WI2388, 32WI2389, 32WI2391, 32WI2392, 32WI2393, 32WI2394, 32WI2398, 32WI2406, 32WI2408.	Each of these sites is avoided with a minimum 50 ft buffer. Additionally, for sites located between 50 and 100 ft of Project workspace, WBI Energy commits to fencing and monitoring at these locations.	Section 5.3
o US Forest Service Sites: 32MZ3301, 32MZ3314, 32MZ3315, 32MZ3319, 32MZ3320, 32MZ3322, 32MZ3324.	Each of these sites is avoided with a minimum 50 ft buffer. Additionally, for sites located between 50 and 100 ft of Project workspace, WBI Energy commits to fencing and monitoring at these locations.	Section 5.5
Formally evaluate with site delineation and at least one 1x1 m TU. Submit evaluation plan prior to fieldwork:		
o Private Land: 32BK278, 32MZ3302, 32MZ3306, 32MZ3307, 32MZ3318, 32MZ3323, 32MZ3326, 32MZ3328, 32MZ3329, 32MZ3331, 32WI2390, 32WI2405, 32WI2407, 32WI2409, 32WI2410.	Additional testing (shovel testing and/or the excavation of at least one, 1 x 1 m test unit) was completed at each of these sites in accordance with a testing plan approved by the SHSND. Testing at sites 32WI2390 and 32MZ3328 was suspended following the identification of stone features at these sites; however, the pipeline route has been adjusted to avoid these sites with a minimum 50-ft buffer.	Section 5.3
o US Forest Service Site: 32MZ2346.	While ERM planned to conduct additional testing at this site, the pipeline route was modified prior to this work such that the site is now avoided by the Project with a buffer greater than 100 ft.	Section 5.5
Isolated finds:		
o Discuss subsurface potential on all IFs on a case-by-case basis. If the finds are in a good depositional context, STPs may be necessary to show that these are truly isolates. Minimal site recording may be enough to get a site number for database purposes, but more information is needed to verify that these are truly part of a category that can be written-off as not eligible.	Individual descriptions of isolated finds have been added to the text, including the results of shovel testing or an explanation for why shovel tests were not excavated.	Section 5.7

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Site-by-site comments, private land:		
o 32BK168 – Expand reasoning for Not Eligible Determination both previously and now. Newly recorded site boundary included previously unidentified features. Perhaps site should be unevaluated. Consider formal evaluation and provide updated management recommendations.	ERM conducted site testing at 32BK168 in 2020. Evidence of intact cultural deposits and features was identified during testing and the site is now recommended as eligible for listing in the NRHP. The pipeline route has been modified to avoid this site with a buffer of 57 ft.	Section 5.3
o 32MZ3323 – Discussion mentions "Better Examples" of homesteads. Provide examples.	The description for 32MZ3323 has been updated to incorporate the results of additional testing (shovel testing and the excavation of a 1 x 1 m test unit) in the updated Class III report.	Section 5.3
o 32WI1495 – Actual well shown in Figure 5.3-81 may be visible in figure 5.3-80. Is this location impacted by project? Consider site lead.	The location of the well (which is no longer extant) is discussed in the updated Class III report in conjunction with 32WI1495. ERM has submitted a site lead form for this resource. The suggested boundary of the site lead is 19 ft from Project workspace. The actual location of the well is about 235 ft from Project workspace.	Section 5.3
o 32WI2404 – How is this identified as prehistoric? Could it be a result of natural glacial and/or historic or modern field clearing? Provide evidence. Fence and monitor as necessary.	The interpretation of the feature at 32WI2404 as prehistoric is conservative and based on best professional judgement. Tribal cultural specialists who visited the site with ERM concurred with this interpretation.	Section 5.3
o 32WI2408 – Workspace is extremely close to possible graves. Is the planned route fixed?	The pipeline route has been modified to avoid this site with a buffer of 213 ft.	Section 5.3
Site-by-site comments, US Army Corps of Engineers land:		
o 32MZ976 – Drilling under site is not avoidance as leaks and emergency repairs do consider cultural resources. Formal testing or horizontal avoidance is necessary.	The trajectory of the HDD will be 160 to 180 ft below ground surface where it passes beneath 32WI976. The pipeline will carry gas, not a liquid; the gas would migrate to the surface and dissipate into the air in the event of a leak. Given the depth of the HDD installation, daylighting of the pipeline for repair would not be feasible. If repair is required in the future, the most likely course of action would be to re-install a new segment via HDD, which would require federal authorizations, thereby triggering review of the action under Section 106 of the NHPA. A description of the HDD method has been added to the description of 32WI976 in Section 5.4 of the report. Additional testing at the site is pending and scheduled to be completed this fall. The results will be discussed in an addendum report.	Section 5.4
o 32MZ976 – Show bore location and HDD line on map	A figure showing the HDD alignment with entry and exit points has been added to the description of this site as has a construction alignment sheet. The alignment sheet depicts the HDD in plan and profile.	Section 5.4

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
o 32MZ976 – Clarify and provide more evidence for geomorphological hypothesis of A horizon being related to flood deposits. Typically, A horizons show stability rather than accretional or erosional events. Provide more information on why artifacts are interpreted as disturbed rather than in primary context.	The text in the updated Class III report has been updated to address this comment. As noted above, additional testing is planned to occur at 32WI976 this fall, which will provide additional information on the soils present at the site.	Section 5.4
o 32MZ976 – Did cut bank provide additional information on buried soils? Were artifacts identified in cut bank?	The cut bank was examined during the initial survey. As noted above, additional testing is planned to occur at the site this fall with results to be discussed in an addendum report.	Section 5.4
o 32WI976 – Given size and shape of site, additional TUs recommended.		
Comments from the Bureau of Land Management		
o The recommended protection/avoidance measures for unevaluated and eligible archaeological sites in the Class III report are inadequate, particularly regarding stone feature sites. The usual avoidance distance requested/required by the BLM is 100 feet. More than 100 feet is preferred for stone feature sites. Revise protection/avoidance measures buffers for archaeological sites.	WBI Energy has routed the pipeline to avoid unevaluated and eligible sites with a minimum buffer of 50 ft as directed by the SHSND.	Sections 5.3 through 5.5
o Why were indirect effects to archaeological sites not considered? Setting is an important aspect of integrity for stone feature sites. There are numerous archaeological sites within and near the survey corridor that should be analyzed for indirect effects. Revise the report to address indirect effects to archaeological sites.	The report has been updated to include an assessment of physical and non-physical impacts on unevaluated and eligible sites.	Sections 4 and 5.5 through 5.5
o WBI Energy needs to develop a cultural resource monitoring plan for construction.	WBI Energy commits to preparing a monitoring plan for construction.	Sections 5.3 through 5.5
o Update site form for all sites, site leads, and isolated finds regardless of whether they were relocated. Even if a cultural resource could not be relocated, that is still valuable information for the next project/site visit.	Site form updates have been submitted for all sites, isolated finds, and site leads discussed in the updated Class III report	N/A
o WBI Energy should make additional efforts to involve tribes in upcoming 2020 fieldwork and field reviews.	As discussed in more detail in Section 4 of the updated Class III report, WBI Energy retained Beaver Creek Archaeology to coordinate tribal participation in fieldwork in 2020. BCA worked with tribes to document sites as cultural heritage resources. The results of that work will be presented in a separate report. Information on tribal participation in the surveys also is provided in Sections 4 and 5.3 through 5.5 of ERM's updated Class III report	Sections 4 and 5.3 through 5.5

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Comments from U.S. Army Corps of Engineers		
o In section 5.4.2, remove figures for 32MZ0598 and move to the previous section.	This comment is addressed in the updated Class III report	Section 5.4
o Figure 5.4-5: Map of Site 32WI976, provide contour lines on this map to show the slope. This information would help to explain why the shovel testing pattern appears the way it does.	Contour lines are provided on Figure 5.4-9 in the updated Class III report.	Section 5.4
o ERM, on behalf of WBI [Energy], identified a second concentration of artifacts in the western side of site 32WI0976 after they started excavating the test unit. Some additional testing is needed here as USACE cannot agree with the recommended determination for this site given the data presented in this report.	Additional testing will be completed at this site in the fall of 2020 with the results presented in an addendum report.	Section 5.4
o USACE recommends that WBI [Energy] conduct a remote sensing evaluation (gradiometer or conductivity) at site 32WI0976. This would be the best way to produce measurable data regarding the presence/absence of subsurface features at the site.	A remote sensing survey of the site was completed in the summer of 2020. The results of the survey were used to prepare a testing plan for 32WI976. Additional testing at the site will occur this fall with the results presented in an addendum report.	Section 5.4
Comments from the U.S. Forest Service		
o The map showing previously recorded cultural resources within a one-mile radius is only included in the overall Class III and not in the Forest Service stand-alone report. Please include this in the stand-alone Forest Service report.	This comment is no longer applicable. Survey results for USFS lands are included in the updated Class III inventory report in Section 5.5.	N/A
o Figure 1.1-2 shows the Forest Service surface and differentiates between the survey corridor and the survey corridor on Forest Service surface; however, the survey corridor on Forest Service surface and the actual Forest Service surface displayed don't match.	This comment is no longer applicable. Survey results for USFS lands are included in the updated Class III inventory report in Section 5.5.	N/A
o Sites 32MZ2347 (Historical Archaeological) and 32MZ3278 (Cairn) are located immediately adjacent to the survey corridor but are not discussed. Please discuss.	Based on route modifications, 32MZ3278 was visited in 2020 and the site boundary expanded based on the findings. A discussion of the site is provided in the updated Class III report. 32MZ2347 is outside the inventory corridor for the Project; however, we have included a discussion of this site in the Class III inventory report.	Section 5.5
o Site 32MZ145 site form update does not appear to have been performed. Why? Was an attempt made to actually relocate the site? Also, according to the site form, a THPO representative requested avoidance in 2013. More work on this site is probably needed.	When 32MZ145 was first recorded in 1979, it was characterized as two stone cairns. Subsequent investigations described the site as consisting of a single historic rock clearing pile on the west side of Highway 1806, noting that the second pile was likely destroyed by construction of the highway. ERM's survey in 2019 was limited to the east side of Highway 1806, which explains why we did not relocate the site at that time. In 2020, ERM conducted additional survey on USFS lands, examining a corridor on the west side of Highway 1806. 32MZ145 was relocated as a result of this work. The site is discussed in the updated Class III report. Tribal cultural specialists who accompanied ERM during the 2020 field investigation concurred that 32MZ145 is historic rock clearing pile.	Section 5.5

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
o Site 32MZ2346 and 32MZ144: it is very improbable and therefore suspicious that there are zero artifacts and one artifact respectively at sites with historic dumps.	Sites 32MZ2346 and 32MZ144 are both previously recorded historic sites which ERM revisited and recorded during the survey for the Project. Cultural material was observed at both sites as described in the updated Class III report. ERM expanded the boundaries of 32MZ2346 to encompass two previously unreported features at the site. One artifact–a commemorative coin–was collected from 32MZ2346 because of its uniqueness. No artifacts were collected from 32MZ144. Expanded descriptions of both sites are provided in the updated Class III report.	Section 5.5
o Additional survey is shown as needed near site 32MZ3278 on the maps in the overall Class III report but not in the Forest Service stand-alone report. Please include this in the stand-alone Forest Service report.	Additional survey was completed in 2020 on USFS lands in the vicinity of 32MZ3278, which was relocated. A description of the site is provided in the updated Class III report.	Section 5.5
o The recommended avoidance and fencing measures are inadequate, especially for stone feature sites.	All stone feature sites have been avoided with a minimum buffet of 50 ft. Additionally, for sites between 50 and 100 ft of Project workspace WBI Energy commits to fencing and monitoring the sites during construction. WBI Energy will provide a monitoring plan for agency review.	Section 5.5
o A monitoring plan is needed.	WBI Energy commits to providing a construction monitoring plan as discussed in the updated Class III report.	
o Updates should have been conducted for all sites, site leads, and IFs [isolated finds] regardless of whether or not they were relocated.	Site form updates have been submitted for all applicable sites, isolated finds, and site leads discussed in the report	N/A
o The discussion of site leads during fieldwork is inadequate.	Site leads are discussed in Section 5.6 of the updated Class III report.	Section 5.6
o Provide specific distances between site boundaries and the edge of the workspace.	Distances between sites and Project workspaces have been added to summary tables and site descriptions throughout the updated Class III report.	Sections 5.3 through 5.5
o Provide a map of shovel testing performed outside of site boundaries. The report explains the testing strategy during survey but never discusses or shows specifics except within site boundaries.	The route maps provided as Appendix B depict survey methodology in addition to survey coverage and results.	Appendix B
o Identify the level of tribal involvement in the survey.	Tribal participation in field surveys is discussed in Sections 4 and 5.3 through 5.5 of the updated Class III report.	Sections 4 and 5.3 through 5.5
o Discuss whether indirect effects to archaeological sites were considered.	For unevaluated sites, we have added an assessment of non-physical impacts on setting.	Sections 5.3 through 5.5

Teanna Limpy Tribal Historic Preservation Officer
Northern Cheyenne Tribe
PO Box 128
Lame Deer, MT 59043

Subject: WBI Energy Transmission, Inc.
North Bakken Expansion Project – Class III Survey Reports 2020 Field Season
McKenzie, Williams, Burke, and Mountrail Counties, North Dakota
ND SHPO Ref.: 19-5593

Dear Ms. Limpy:

Please reference WBI Energy Transmission, Inc.'s (WBI Energy's) previous correspondence regarding the above referenced project. WBI Energy proposes to construct and operate the North Bakken Expansion Project (Project) in McKenzie, Williams, Burke, and Mountrail Counties, North Dakota.

The Project is regulated by the Federal Energy Regulatory Commission (FERC) under Section 7(c) of the Natural Gas Act. Under the Energy Policy Act of 2005, FERC is the lead agency for coordinating federal authorizations and complying with the National Environmental Policy Act on natural gas pipeline projects subject to its jurisdiction. FERC similarly is the lead federal agency for complying with Section 106 of the National Historic Preservation Act (NHPA) on natural gas pipeline projects under its jurisdiction. In accordance with 36 CFR 800.2(c)(4), WBI Energy is assisting the FERC in meeting its obligations under Section 106 of the NHPA by coordinating with agencies and tribes and conducting surveys to identify historic properties that may be affected by the Project.

Enclosed for your review please find Class III survey reports for the archaeological and historic structures surveys that were conducted during the 2019 and 2020 field seasons. The archaeological report includes the results provided in the original Class III report and addresses comments that were provided by the State Historical Society of North Dakota, Bureau of Land Management, U.S. Army Corps of Engineers, and the U.S. Forest Service. The attached table summarizes our response to those comments and provides the location of the relevant revisions or clarifications. A report on geomorphological investigations is also included in this submittal.

WBI Energy would appreciate your comments on the attached reports. If you have any questions or comments on the Project or the reports, please contact me at 612-840-8976 or pat.robblee@erm.com, or Dr. Kevin Malloy at 906-285-0361 or kevin.malloy@erm.com. Please direct written correspondence to Dr. Malloy's attention at:

Attachment: Table summarizing agency comments on the original Class III archaeology report

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Comments from the State Historical Society of North Dakota		
General comments:		
o Provide more background information on sites with previous work. Focus on methods and reasoning for previous eligibility recommendation.	Additional information on previous investigations has been added to site descriptions, as applicable.	Sections 5.3 through 5.7
o Map symbology has item named "Shovel test – No Dig". Are these shovel probes that were planned, but not excavated for some reason? If so provide explanation.	These are planned but unexcavated shovel tests. Site descriptions have been updated, as applicable, to explain why some planned shovel tests were not excavated. Typical reasons for not excavating shovel tests include the presence of buried utilities (documented through One-Call markings) or slope.	Sections 5.3 through 5.5
Avoidance, 50 ft buffer minimum, fence, and monitor:		
o Private land: 32BK277, 32BK279, 32BK280, 32BK282, 32MZ3308, 32MZ3309, 32MZ3310, 32MZ3311, 32MZ3325, 32MZ3327, 32WI1494, 32WI1630, 32WI2144, 32WI2388, 32WI2389, 32WI2391, 32WI2392, 32WI2393, 32WI2394, 32WI2398, 32WI2406, 32WI2408.	Each of these sites is avoided with a minimum 50 ft buffer. Additionally, for sites located between 50 and 100 ft of Project workspace, WBI Energy commits to fencing and monitoring at these locations.	Section 5.3
o US Forest Service Sites: 32MZ3301, 32MZ3314, 32MZ3315, 32MZ3319, 32MZ3320, 32MZ3322, 32MZ3324.	Each of these sites is avoided with a minimum 50 ft buffer. Additionally, for sites located between 50 and 100 ft of Project workspace, WBI Energy commits to fencing and monitoring at these locations.	Section 5.5
Formally evaluate with site delineation and at least one 1x1 m TU. Submit evaluation plan prior to fieldwork:		
o Private Land: 32BK278, 32MZ3302, 32MZ3306, 32MZ3307, 32MZ3318, 32MZ3323, 32MZ3326, 32MZ3328, 32MZ3329, 32MZ3331, 32WI2390, 32WI2405, 32WI2407, 32WI2409, 32WI2410.	Additional testing (shovel testing and/or the excavation of at least one, 1 x 1 m test unit) was completed at each of these sites in accordance with a testing plan approved by the SHSND. Testing at sites 32WI2390 and 32MZ3328 was suspended following the identification of stone features at these sites; however, the pipeline route has been adjusted to avoid these sites with a minimum 50-ft buffer.	Section 5.3
o US Forest Service Site: 32MZ2346.	While ERM planned to conduct additional testing at this site, the pipeline route was modified prior to this work such that the site is now avoided by the Project with a buffer greater than 100 ft.	Section 5.5
Isolated finds:		
o Discuss subsurface potential on all IFs on a case-by-case basis. If the finds are in a good depositional context, STPs may be necessary to show that these are truly isolates. Minimal site recording may be enough to get a site number for database purposes, but more information is needed to verify that these are truly part of a category that can be written-off as not eligible.	Individual descriptions of isolated finds have been added to the text, including the results of shovel testing or an explanation for why shovel tests were not excavated.	Section 5.7

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Site-by-site comments, private land:		
o 32BK168 – Expand reasoning for Not Eligible Determination both previously and now. Newly recorded site boundary included previously unidentified features. Perhaps site should be unevaluated. Consider formal evaluation and provide updated management recommendations.	ERM conducted site testing at 32BK168 in 2020. Evidence of intact cultural deposits and features was identified during testing and the site is now recommended as eligible for listing in the NRHP. The pipeline route has been modified to avoid this site with a buffer of 57 ft.	Section 5.3
o 32MZ3323 – Discussion mentions "Better Examples" of homesteads. Provide examples.	The description for 32MZ3323 has been updated to incorporate the results of additional testing (shovel testing and the excavation of a 1 x 1 m test unit) in the updated Class III report.	Section 5.3
o 32WI1495 – Actual well shown in Figure 5.3-81 may be visible in figure 5.3-80. Is this location impacted by project? Consider site lead.	The location of the well (which is no longer extant) is discussed in the updated Class III report in conjunction with 32WI1495. ERM has submitted a site lead form for this resource. The suggested boundary of the site lead is 19 ft from Project workspace. The actual location of the well is about 235 ft from Project workspace.	Section 5.3
o 32WI2404 – How is this identified as prehistoric? Could it be a result of natural glacial and/or historic or modern field clearing? Provide evidence. Fence and monitor as necessary.	The interpretation of the feature at 32WI2404 as prehistoric is conservative and based on best professional judgement. Tribal cultural specialists who visited the site with ERM concurred with this interpretation.	Section 5.3
o 32WI2408 – Workspace is extremely close to possible graves. Is the planned route fixed?	The pipeline route has been modified to avoid this site with a buffer of 213 ft.	Section 5.3
Site-by-site comments, US Army Corps of Engineers land:		
o 32MZ976 – Drilling under site is not avoidance as leaks and emergency repairs do consider cultural resources. Formal testing or horizontal avoidance is necessary.	The trajectory of the HDD will be 160 to 180 ft below ground surface where it passes beneath 32WI976. The pipeline will carry gas, not a liquid; the gas would migrate to the surface and dissipate into the air in the event of a leak. Given the depth of the HDD installation, daylighting of the pipeline for repair would not be feasible. If repair is required in the future, the most likely course of action would be to re-install a new segment via HDD, which would require federal authorizations, thereby triggering review of the action under Section 106 of the NHPA. A description of the HDD method has been added to the description of 32WI976 in Section 5.4 of the report. Additional testing at the site is pending and scheduled to be completed this fall. The results will be discussed in an addendum report.	Section 5.4
o 32MZ976 – Show bore location and HDD line on map	A figure showing the HDD alignment with entry and exit points has been added to the description of this site as has a construction alignment sheet. The alignment sheet depicts the HDD in plan and profile.	Section 5.4

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
o 32MZ976 – Clarify and provide more evidence for geomorphological hypothesis of A horizon being related to flood deposits. Typically, A horizons show stability rather than accretional or erosional events. Provide more information on why artifacts are interpreted as disturbed rather than in primary context.	The text in the updated Class III report has been updated to address this comment. As noted above, additional testing is planned to occur at 32WI976 this fall, which will provide additional information on the soils present at the site.	Section 5.4
o 32MZ976 – Did cut bank provide additional information on buried soils? Were artifacts identified in cut bank?	The cut bank was examined during the initial survey. As noted above, additional testing is planned to occur at the site this fall with results to be discussed in an addendum report.	Section 5.4
o 32WI976 – Given size and shape of site, additional TUs recommended.		
Comments from the Bureau of Land Management		
o The recommended protection/avoidance measures for unevaluated and eligible archaeological sites in the Class III report are inadequate, particularly regarding stone feature sites. The usual avoidance distance requested/required by the BLM is 100 feet. More than 100 feet is preferred for stone feature sites. Revise protection/avoidance measures buffers for archaeological sites.	WBI Energy has routed the pipeline to avoid unevaluated and eligible sites with a minimum buffer of 50 ft as directed by the SHSND.	Sections 5.3 through 5.5
o Why were indirect effects to archaeological sites not considered? Setting is an important aspect of integrity for stone feature sites. There are numerous archaeological sites within and near the survey corridor that should be analyzed for indirect effects. Revise the report to address indirect effects to archaeological sites.	The report has been updated to include an assessment of physical and non-physical impacts on unevaluated and eligible sites.	Sections 4 and 5.5 through 5.5
o WBI Energy needs to develop a cultural resource monitoring plan for construction.	WBI Energy commits to preparing a monitoring plan for construction.	Sections 5.3 through 5.5
o Update site form for all sites, site leads, and isolated finds regardless of whether they were relocated. Even if a cultural resource could not be relocated, that is still valuable information for the next project/site visit.	Site form updates have been submitted for all sites, isolated finds, and site leads discussed in the updated Class III report	N/A
o WBI Energy should make additional efforts to involve tribes in upcoming 2020 fieldwork and field reviews.	As discussed in more detail in Section 4 of the updated Class III report, WBI Energy retained Beaver Creek Archaeology to coordinate tribal participation in fieldwork in 2020. BCA worked with tribes to document sites as cultural heritage resources. The results of that work will be presented in a separate report. Information on tribal participation in the surveys also is provided in Sections 4 and 5.3 through 5.5 of ERM's updated Class III report	Sections 4 and 5.3 through 5.5

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Comments from U.S. Army Corps of Engineers		
o In section 5.4.2, remove figures for 32MZ0598 and move to the previous section.	This comment is addressed in the updated Class III report	Section 5.4
o Figure 5.4-5: Map of Site 32WI976, provide contour lines on this map to show the slope. This information would help to explain why the shovel testing pattern appears the way it does.	Contour lines are provided on Figure 5.4-9 in the updated Class III report.	Section 5.4
o ERM, on behalf of WBI [Energy], identified a second concentration of artifacts in the western side of site 32WI0976 after they started excavating the test unit. Some additional testing is needed here as USACE cannot agree with the recommended determination for this site given the data presented in this report.	Additional testing will be completed at this site in the fall of 2020 with the results presented in an addendum report.	Section 5.4
o USACE recommends that WBI [Energy] conduct a remote sensing evaluation (gradiometer or conductivity) at site 32WI0976. This would be the best way to produce measurable data regarding the presence/absence of subsurface features at the site.	A remote sensing survey of the site was completed in the summer of 2020. The results of the survey were used to prepare a testing plan for 32WI976. Additional testing at the site will occur this fall with the results presented in an addendum report.	Section 5.4
Comments from the U.S. Forest Service		
o The map showing previously recorded cultural resources within a one-mile radius is only included in the overall Class III and not in the Forest Service stand-alone report. Please include this in the stand-alone Forest Service report.	This comment is no longer applicable. Survey results for USFS lands are included in the updated Class III inventory report in Section 5.5.	N/A
o Figure 1.1-2 shows the Forest Service surface and differentiates between the survey corridor and the survey corridor on Forest Service surface; however, the survey corridor on Forest Service surface and the actual Forest Service surface displayed don't match.	This comment is no longer applicable. Survey results for USFS lands are included in the updated Class III inventory report in Section 5.5.	N/A
o Sites 32MZ2347 (Historical Archaeological) and 32MZ3278 (Cairn) are located immediately adjacent to the survey corridor but are not discussed. Please discuss.	Based on route modifications, 32MZ3278 was visited in 2020 and the site boundary expanded based on the findings. A discussion of the site is provided in the updated Class III report. 32MZ2347 is outside the inventory corridor for the Project; however, we have included a discussion of this site in the Class III inventory report.	Section 5.5
o Site 32MZ145 site form update does not appear to have been performed. Why? Was an attempt made to actually relocate the site? Also, according to the site form, a THPO representative requested avoidance in 2013. More work on this site is probably needed.	When 32MZ145 was first recorded in 1979, it was characterized as two stone cairns. Subsequent investigations described the site as consisting of a single historic rock clearing pile on the west side of Highway 1806, noting that the second pile was likely destroyed by construction of the highway. ERM's survey in 2019 was limited to the east side of Highway 1806, which explains why we did not relocate the site at that time. In 2020, ERM conducted additional survey on USFS lands, examining a corridor on the west side of Highway 1806. 32MZ145 was relocated as a result of this work. The site is discussed in the updated Class III report. Tribal cultural specialists who accompanied ERM during the 2020 field investigation concurred that 32MZ145 is historic rock clearing pile.	Section 5.5

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
o Site 32MZ2346 and 32MZ144: it is very improbable and therefore suspicious that there are zero artifacts and one artifact respectively at sites with historic dumps.	Sites 32MZ2346 and 32MZ144 are both previously recorded historic sites which ERM revisited and recorded during the survey for the Project. Cultural material was observed at both sites as described in the updated Class III report. ERM expanded the boundaries of 32MZ2346 to encompass two previously unreported features at the site. One artifact–a commemorative coin–was collected from 32MZ2346 because of its uniqueness. No artifacts were collected from 32MZ144. Expanded descriptions of both sites are provided in the updated Class III report.	Section 5.5
o Additional survey is shown as needed near site 32MZ3278 on the maps in the overall Class III report but not in the Forest Service stand-alone report. Please include this in the stand-alone Forest Service report.	Additional survey was completed in 2020 on USFS lands in the vicinity of 32MZ3278, which was relocated. A description of the site is provided in the updated Class III report.	Section 5.5
o The recommended avoidance and fencing measures are inadequate, especially for stone feature sites.	All stone feature sites have been avoided with a minimum buffet of 50 ft. Additionally, for sites between 50 and 100 ft of Project workspace WBI Energy commits to fencing and monitoring the sites during construction. WBI Energy will provide a monitoring plan for agency review.	Section 5.5
o A monitoring plan is needed.	WBI Energy commits to providing a construction monitoring plan as discussed in the updated Class III report.	
o Updates should have been conducted for all sites, site leads, and IFs [isolated finds] regardless of whether or not they were relocated.	Site form updates have been submitted for all applicable sites, isolated finds, and site leads discussed in the report	N/A
o The discussion of site leads during fieldwork is inadequate.	Site leads are discussed in Section 5.6 of the updated Class III report.	Section 5.6
o Provide specific distances between site boundaries and the edge of the workspace.	Distances between sites and Project workspaces have been added to summary tables and site descriptions throughout the updated Class III report.	Sections 5.3 through 5.5
o Provide a map of shovel testing performed outside of site boundaries. The report explains the testing strategy during survey but never discusses or shows specifics except within site boundaries.	The route maps provided as Appendix B depict survey methodology in addition to survey coverage and results.	Appendix B
o Identify the level of tribal involvement in the survey.	Tribal participation in field surveys is discussed in Sections 4 and 5.3 through 5.5 of the updated Class III report.	Sections 4 and 5.3 through 5.5
o Discuss whether indirect effects to archaeological sites were considered.	For unevaluated sites, we have added an assessment of non-physical impacts on setting.	Sections 5.3 through 5.5

Subject: WBI Energy Transmission, Inc.
North Bakken Expansion Project – Class III Survey Reports 2020 Field Season
McKenzie, Williams, Burke, and Mountrail Counties, North Dakota
ND SHPO Ref.: 19-5593

Dear Mr. Vance:

Please reference WBI Energy Transmission, Inc.'s (WBI Energy's) previous correspondence regarding the above referenced project. WBI Energy proposes to construct and operate the North Bakken Expansion Project (Project) in McKenzie, Williams, Burke, and Mountrail Counties, North Dakota.

The Project is regulated by the Federal Energy Regulatory Commission (FERC) under Section 7(c) of the Natural Gas Act. Under the Energy Policy Act of 2005, FERC is the lead agency for coordinating federal authorizations and complying with the National Environmental Policy Act on natural gas pipeline projects subject to its jurisdiction. FERC similarly is the lead federal agency for complying with Section 106 of the National Historic Preservation Act (NHPA) on natural gas pipeline projects under its jurisdiction. In accordance with 36 CFR 800.2(c)(4), WBI Energy is assisting the FERC in meeting its obligations under Section 106 of the NHPA by coordinating with agencies and tribes and conducting surveys to identify historic properties that may be affected by the Project.

Enclosed for your review please find Class III survey reports for the archaeological and historic structures surveys that were conducted during the 2019 and 2020 field seasons. The archaeological report includes the results provided in the original Class III report and addresses comments that were provided by the State Historical Society of North Dakota, Bureau of Land Management, U.S. Army Corps of Engineers, and the U.S. Forest Service. The attached table summarizes our response to those comments and provides the location of the relevant revisions or clarifications. A report on geomorphological investigations is also included in this submittal.

WBI Energy would appreciate your comments on the attached reports. If you have any questions or comments on the Project or the reports, please contact me at 612-840-8976 or pat.robblee@erm.com, or Dr. Kevin Malloy at 906-285-0361 or kevin.malloy@erm.com. Please direct written correspondence to Dr. Malloy's attention at:

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Comments from the State Historical Society of North Dakota		
General comments:		
o Provide more background information on sites with previous work. Focus on methods and reasoning for previous eligibility recommendation.	Additional information on previous investigations has been added to site descriptions, as applicable.	Sections 5.3 through 5.7
o Map symbology has item named "Shovel test – No Dig". Are these shovel probes that were planned, but not excavated for some reason? If so provide explanation.	These are planned but unexcavated shovel tests. Site descriptions have been updated, as applicable, to explain why some planned shovel tests were not excavated. Typical reasons for not excavating shovel tests include the presence of buried utilities (documented through One-Call markings) or slope.	Sections 5.3 through 5.5
Avoidance, 50 ft buffer minimum, fence, and monitor:		
o Private land: 32BK277, 32BK279, 32BK280, 32BK282, 32MZ3308, 32MZ3309, 32MZ3310, 32MZ3311, 32MZ3325, 32MZ3327, 32WI1494, 32WI1630, 32WI2144, 32WI2388, 32WI2389, 32WI2391, 32WI2392, 32WI2393, 32WI2394, 32WI2398, 32WI2406, 32WI2408.	Each of these sites is avoided with a minimum 50 ft buffer. Additionally, for sites located between 50 and 100 ft of Project workspace, WBI Energy commits to fencing and monitoring at these locations.	Section 5.3
o US Forest Service Sites: 32MZ3301, 32MZ3314, 32MZ3315, 32MZ3319, 32MZ3320, 32MZ3322, 32MZ3324.	Each of these sites is avoided with a minimum 50 ft buffer. Additionally, for sites located between 50 and 100 ft of Project workspace, WBI Energy commits to fencing and monitoring at these locations.	Section 5.5
Formally evaluate with site delineation and at least one 1x1 m TU. Submit evaluation plan prior to fieldwork:		
o Private Land: 32BK278, 32MZ3302, 32MZ3306, 32MZ3307, 32MZ3318, 32MZ3323, 32MZ3326, 32MZ3328, 32MZ3329, 32MZ3331, 32WI2390, 32WI2405, 32WI2407, 32WI2409, 32WI2410.	Additional testing (shovel testing and/or the excavation of at least one, 1 x 1 m test unit) was completed at each of these sites in accordance with a testing plan approved by the SHSND. Testing at sites 32WI2390 and 32MZ3328 was suspended following the identification of stone features at these sites; however, the pipeline route has been adjusted to avoid these sites with a minimum 50-ft buffer.	Section 5.3
o US Forest Service Site: 32MZ2346.	While ERM planned to conduct additional testing at this site, the pipeline route was modified prior to this work such that the site is now avoided by the Project with a buffer greater than 100 ft.	Section 5.5
Isolated finds:		
o Discuss subsurface potential on all IFs on a case-by-case basis. If the finds are in a good depositional context, STPs may be necessary to show that these are truly isolates. Minimal site recording may be enough to get a site number for database purposes, but more information is needed to verify that these are truly part of a category that can be written-off as not eligible.	Individual descriptions of isolated finds have been added to the text, including the results of shovel testing or an explanation for why shovel tests were not excavated.	Section 5.7

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Site-by-site comments, private land:		
o 32BK168 – Expand reasoning for Not Eligible Determination both previously and now. Newly recorded site boundary included previously unidentified features. Perhaps site should be unevaluated. Consider formal evaluation and provide updated management recommendations.	ERM conducted site testing at 32BK168 in 2020. Evidence of intact cultural deposits and features was identified during testing and the site is now recommended as eligible for listing in the NRHP. The pipeline route has been modified to avoid this site with a buffer of 57 ft.	Section 5.3
o 32MZ3323 – Discussion mentions "Better Examples" of homesteads. Provide examples.	The description for 32MZ3323 has been updated to incorporate the results of additional testing (shovel testing and the excavation of a 1 x 1 m test unit) in the updated Class III report.	Section 5.3
o 32WI1495 – Actual well shown in Figure 5.3-81 may be visible in figure 5.3-80. Is this location impacted by project? Consider site lead.	The location of the well (which is no longer extant) is discussed in the updated Class III report in conjunction with 32WI1495. ERM has submitted a site lead form for this resource. The suggested boundary of the site lead is 19 ft from Project workspace. The actual location of the well is about 235 ft from Project workspace.	Section 5.3
o 32WI2404 – How is this identified as prehistoric? Could it be a result of natural glacial and/or historic or modern field clearing? Provide evidence. Fence and monitor as necessary.	The interpretation of the feature at 32WI2404 as prehistoric is conservative and based on best professional judgement. Tribal cultural specialists who visited the site with ERM concurred with this interpretation.	Section 5.3
o 32WI2408 – Workspace is extremely close to possible graves. Is the planned route fixed?	The pipeline route has been modified to avoid this site with a buffer of 213 ft.	Section 5.3
Site-by-site comments, US Army Corps of Engineers land:		
o 32MZ976 – Drilling under site is not avoidance as leaks and emergency repairs do consider cultural resources. Formal testing or horizontal avoidance is necessary.	The trajectory of the HDD will be 160 to 180 ft below ground surface where it passes beneath 32WI976. The pipeline will carry gas, not a liquid; the gas would migrate to the surface and dissipate into the air in the event of a leak. Given the depth of the HDD installation, daylighting of the pipeline for repair would not be feasible. If repair is required in the future, the most likely course of action would be to re-install a new segment via HDD, which would require federal authorizations, thereby triggering review of the action under Section 106 of the NHPA. A description of the HDD method has been added to the description of 32WI976 in Section 5.4 of the report. Additional testing at the site is pending and scheduled to be completed this fall. The results will be discussed in an addendum report.	Section 5.4
o 32MZ976 – Show bore location and HDD line on map	A figure showing the HDD alignment with entry and exit points has been added to the description of this site as has a construction alignment sheet. The alignment sheet depicts the HDD in plan and profile.	Section 5.4

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
o 32MZ976 – Clarify and provide more evidence for geomorphological hypothesis of A horizon being related to flood deposits. Typically, A horizons show stability rather than accretional or erosional events. Provide more information on why artifacts are interpreted as disturbed rather than in primary context.	The text in the updated Class III report has been updated to address this comment. As noted above, additional testing is planned to occur at 32WI976 this fall, which will provide additional information on the soils present at the site.	Section 5.4
o 32MZ976 – Did cut bank provide additional information on buried soils? Were artifacts identified in cut bank?	The cut bank was examined during the initial survey. As noted above, additional testing is planned to occur at the site this fall with results to be discussed in an addendum report.	Section 5.4
o 32WI976 – Given size and shape of site, additional TUs recommended.		
Comments from the Bureau of Land Management		
o The recommended protection/avoidance measures for unevaluated and eligible archaeological sites in the Class III report are inadequate, particularly regarding stone feature sites. The usual avoidance distance requested/required by the BLM is 100 feet. More than 100 feet is preferred for stone feature sites. Revise protection/avoidance measures buffers for archaeological sites.	WBI Energy has routed the pipeline to avoid unevaluated and eligible sites with a minimum buffer of 50 ft as directed by the SHSND.	Sections 5.3 through 5.5
o Why were indirect effects to archaeological sites not considered? Setting is an important aspect of integrity for stone feature sites. There are numerous archaeological sites within and near the survey corridor that should be analyzed for indirect effects. Revise the report to address indirect effects to archaeological sites.	The report has been updated to include an assessment of physical and non-physical impacts on unevaluated and eligible sites.	Sections 4 and 5.5 through 5.5
o WBI Energy needs to develop a cultural resource monitoring plan for construction.	WBI Energy commits to preparing a monitoring plan for construction.	Sections 5.3 through 5.5
o Update site form for all sites, site leads, and isolated finds regardless of whether they were relocated. Even if a cultural resource could not be relocated, that is still valuable information for the next project/site visit.	Site form updates have been submitted for all sites, isolated finds, and site leads discussed in the updated Class III report	N/A
o WBI Energy should make additional efforts to involve tribes in upcoming 2020 fieldwork and field reviews.	As discussed in more detail in Section 4 of the updated Class III report, WBI Energy retained Beaver Creek Archaeology to coordinate tribal participation in fieldwork in 2020. BCA worked with tribes to document sites as cultural heritage resources. The results of that work will be presented in a separate report. Information on tribal participation in the surveys also is provided in Sections 4 and 5.3 through 5.5 of ERM's updated Class III report	Sections 4 and 5.3 through 5.5

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Comments from U.S. Army Corps of Engineers		
o In section 5.4.2, remove figures for 32MZ0598 and move to the previous section.	This comment is addressed in the updated Class III report	Section 5.4
o Figure 5.4-5: Map of Site 32WI976, provide contour lines on this map to show the slope. This information would help to explain why the shovel testing pattern appears the way it does.	Contour lines are provided on Figure 5.4-9 in the updated Class III report.	Section 5.4
o ERM, on behalf of WBI [Energy], identified a second concentration of artifacts in the western side of site 32WI0976 after they started excavating the test unit. Some additional testing is needed here as USACE cannot agree with the recommended determination for this site given the data presented in this report.	Additional testing will be completed at this site in the fall of 2020 with the results presented in an addendum report.	Section 5.4
o USACE recommends that WBI [Energy] conduct a remote sensing evaluation (gradiometer or conductivity) at site 32WI0976. This would be the best way to produce measurable data regarding the presence/absence of subsurface features at the site.	A remote sensing survey of the site was completed in the summer of 2020. The results of the survey were used to prepare a testing plan for 32WI976. Additional testing at the site will occur this fall with the results presented in an addendum report.	Section 5.4
Comments from the U.S. Forest Service		
o The map showing previously recorded cultural resources within a one-mile radius is only included in the overall Class III and not in the Forest Service stand-alone report. Please include this in the stand-alone Forest Service report.	This comment is no longer applicable. Survey results for USFS lands are included in the updated Class III inventory report in Section 5.5.	N/A
o Figure 1.1-2 shows the Forest Service surface and differentiates between the survey corridor and the survey corridor on Forest Service surface; however, the survey corridor on Forest Service surface and the actual Forest Service surface displayed don't match.	This comment is no longer applicable. Survey results for USFS lands are included in the updated Class III inventory report in Section 5.5.	N/A
o Sites 32MZ2347 (Historical Archaeological) and 32MZ3278 (Cairn) are located immediately adjacent to the survey corridor but are not discussed. Please discuss.	Based on route modifications, 32MZ3278 was visited in 2020 and the site boundary expanded based on the findings. A discussion of the site is provided in the updated Class III report. 32MZ2347 is outside the inventory corridor for the Project; however, we have included a discussion of this site in the Class III inventory report.	Section 5.5
o Site 32MZ145 site form update does not appear to have been performed. Why? Was an attempt made to actually relocate the site? Also, according to the site form, a THPO representative requested avoidance in 2013. More work on this site is probably needed.	When 32MZ145 was first recorded in 1979, it was characterized as two stone cairns. Subsequent investigations described the site as consisting of a single historic rock clearing pile on the west side of Highway 1806, noting that the second pile was likely destroyed by construction of the highway. ERM's survey in 2019 was limited to the east side of Highway 1806, which explains why we did not relocate the site at that time. In 2020, ERM conducted additional survey on USFS lands, examining a corridor on the west side of Highway 1806. 32MZ145 was relocated as a result of this work. The site is discussed in the updated Class III report. Tribal cultural specialists who accompanied ERM during the 2020 field investigation concurred that 32MZ145 is historic rock clearing pile.	Section 5.5

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
o Site 32MZ2346 and 32MZ144: it is very improbable and therefore suspicious that there are zero artifacts and one artifact respectively at sites with historic dumps.	Sites 32MZ2346 and 32MZ144 are both previously recorded historic sites which ERM revisited and recorded during the survey for the Project. Cultural material was observed at both sites as described in the updated Class III report. ERM expanded the boundaries of 32MZ2346 to encompass two previously unreported features at the site. One artifact–a commemorative coin–was collected from 32MZ2346 because of its uniqueness. No artifacts were collected from 32MZ144. Expanded descriptions of both sites are provided in the updated Class III report.	Section 5.5
o Additional survey is shown as needed near site 32MZ3278 on the maps in the overall Class III report but not in the Forest Service stand-alone report. Please include this in the stand-alone Forest Service report.	Additional survey was completed in 2020 on USFS lands in the vicinity of 32MZ3278, which was relocated. A description of the site is provided in the updated Class III report.	Section 5.5
o The recommended avoidance and fencing measures are inadequate, especially for stone feature sites.	All stone feature sites have been avoided with a minimum buffet of 50 ft. Additionally, for sites between 50 and 100 ft of Project workspace WBI Energy commits to fencing and monitoring the sites during construction. WBI Energy will provide a monitoring plan for agency review.	Section 5.5
o A monitoring plan is needed.	WBI Energy commits to providing a construction monitoring plan as discussed in the updated Class III report.	
o Updates should have been conducted for all sites, site leads, and IFs [isolated finds] regardless of whether or not they were relocated.	Site form updates have been submitted for all applicable sites, isolated finds, and site leads discussed in the report	N/A
o The discussion of site leads during fieldwork is inadequate.	Site leads are discussed in Section 5.6 of the updated Class III report.	Section 5.6
o Provide specific distances between site boundaries and the edge of the workspace.	Distances between sites and Project workspaces have been added to summary tables and site descriptions throughout the updated Class III report.	Sections 5.3 through 5.5
o Provide a map of shovel testing performed outside of site boundaries. The report explains the testing strategy during survey but never discusses or shows specifics except within site boundaries.	The route maps provided as Appendix B depict survey methodology in addition to survey coverage and results.	Appendix B
o Identify the level of tribal involvement in the survey.	Tribal participation in field surveys is discussed in Sections 4 and 5.3 through 5.5 of the updated Class III report.	Sections 4 and 5.3 through 5.5
o Discuss whether indirect effects to archaeological sites were considered.	For unevaluated sites, we have added an assessment of non-physical impacts on setting.	Sections 5.3 through 5.5

Assiniboine and Sioux Tribes of the Fort Peck Reservation

MEETING NOTES

LOG OF IN PERSON MEETING

MEETING ATTENDEES:

Dyan Youpee – Assiniboine & Sioux Tribes Tribal Historic Preservation Officer
Eugene Ryan – Assiniboine & Sioux Tribes Tribal Cultural Specialist
Andrea Kruse – U.S. Forest Service (USFS)
Lucas - USFS
Katie West – Bureau of Land Management (BLM)
Jill Linn – WBI Energy Transmission, Inc. (WBI Energy)
Andrew Clark – State Historical Society of North Dakota (SHSND)
Fern Swenson - SHSND
Wade Burns – Beaver Creek Archaeology (BCA)
Raina Hanley – BCA
Larry Pallozzi – BCA
Jayson Zoino – Environmental Resource Group (ERM)

DATE:	TIME OF CONVERSATION:
September 11, 2020	11:30 am to 4:30 pm

RE:

North Bakken Expansion Project

LOG OF CONVERSATION:

ERM visited sites 32MZ3379, 32MZ3380, 32MZ3382, 32MZ3383, and 32MZ3385 on USFS lands with representatives of the Assiniboine & Sioux Tribes, SHSND, USFS, BLM, WBI Energy, and BCA. ERM documented these sites in the summer of 2020 during survey for WBI Energy's North Bakken Expansion Project. Tribal cultural specialists representing the Assiniboine & Sioux Tribes, Standing Rock Sioux Tribe, Rosebud Sioux Tribe (including one specialist working on behalf of the Sisseton Wahpeton Oyate Tribe), and Turtle Mountain Band of Chippewa Indians monitored ERM's delineation of the sites; however, the specialists did not uniformly concur with the interpretation of the finds as archaeological. Some of the specialists concluded that the finds documented by ERM are non-cultural.

The visits to 32MZ3379, 32MZ3380, 32MZ3382, 32MZ3383, and 32MZ3385 allowed Ms. Youpee and Mr. Ryan to inspect the sites and features recorded by ERM. Ms. Youpee did not concur with the interpretation of the finds as archaeological, instead concluding that the features are either natural or the result of modern disturbances.

The meeting participants also discussed: processes for addressing sites where tribal cultural specialists do not concur with interpretations by archaeologists; the roles of the different agencies reviewing the North Bakken Expansion Project; the different expertise provided by tribal cultural specialists and archaeologists; and the qualifications of ERM's archaeologists.

Subject: WBI Energy Transmission, Inc.
North Bakken Expansion Project – Class III Survey Reports 2020 Field Season
McKenzie, Williams, Burke, and Mountrail Counties, North Dakota
ND SHPO Ref.: 19-5593

Dear Ms. Youpee:

Please reference WBI Energy Transmission, Inc.'s (WBI Energy's) previous correspondence regarding the above referenced project. WBI Energy proposes to construct and operate the North Bakken Expansion Project (Project) in McKenzie, Williams, Burke, and Mountrail Counties, North Dakota.

The Project is regulated by the Federal Energy Regulatory Commission (FERC) under Section 7(c) of the Natural Gas Act. Under the Energy Policy Act of 2005, FERC is the lead agency for coordinating federal authorizations and complying with the National Environmental Policy Act on natural gas pipeline projects subject to its jurisdiction. FERC similarly is the lead federal agency for complying with Section 106 of the National Historic Preservation Act (NHPA) on natural gas pipeline projects under its jurisdiction. In accordance with 36 CFR 800.2(c)(4), WBI Energy is assisting the FERC in meeting its obligations under Section 106 of the NHPA by coordinating with agencies and tribes and conducting surveys to identify historic properties that may be affected by the Project.

Enclosed for your review please find Class III survey reports for the archaeological and historic structures surveys that were conducted during the 2019 and 2020 field seasons. The archaeological report includes the results provided in the original Class III report and addresses comments that were provided by the State Historical Society of North Dakota, Bureau of Land Management, U.S. Army Corps of Engineers, and the U.S. Forest Service. The attached table summarizes our response to those comments and provides the location of the relevant revisions or clarifications. A report on geomorphological investigations is also included in this submittal.

WBI Energy would appreciate your comments on the attached reports. If you have any questions or comments on the Project or the reports, please contact me at 612-840-8976 or pat.robblee@erm.com, or Dr. Kevin Malloy at 906-285-0361 or kevin.malloy@erm.com. Please direct written correspondence to Dr. Malloy's attention at:

Environmental Resources Management
1000 IDS Center

Attachment: Table summarizing agency comments on the original Class III archaeology report

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Comments from the State Historical Society of North Dakota		
General comments:		
o Provide more background information on sites with previous work. Focus on methods and reasoning for previous eligibility recommendation.	Additional information on previous investigations has been added to site descriptions, as applicable.	Sections 5.3 through 5.7
o Map symbology has item named "Shovel test – No Dig". Are these shovel probes that were planned, but not excavated for some reason? If so provide explanation.	These are planned but unexcavated shovel tests. Site descriptions have been updated, as applicable, to explain why some planned shovel tests were not excavated. Typical reasons for not excavating shovel tests include the presence of buried utilities (documented through One-Call markings) or slope.	Sections 5.3 through 5.5
Avoidance, 50 ft buffer minimum, fence, and monitor:		
o Private land: 32BK277, 32BK279, 32BK280, 32BK282, 32MZ3308, 32MZ3309, 32MZ3310, 32MZ3311, 32MZ3325, 32MZ3327, 32WI1494, 32WI1630, 32WI2144, 32WI2388, 32WI2389, 32WI2391, 32WI2392, 32WI2393, 32WI2394, 32WI2398, 32WI2406, 32WI2408.	Each of these sites is avoided with a minimum 50 ft buffer. Additionally, for sites located between 50 and 100 ft of Project workspace, WBI Energy commits to fencing and monitoring at these locations.	Section 5.3
o US Forest Service Sites: 32MZ3301, 32MZ3314, 32MZ3315, 32MZ3319, 32MZ3320, 32MZ3322, 32MZ3324.	Each of these sites is avoided with a minimum 50 ft buffer. Additionally, for sites located between 50 and 100 ft of Project workspace, WBI Energy commits to fencing and monitoring at these locations.	Section 5.5
Formally evaluate with site delineation and at least one 1x1 m TU. Submit evaluation plan prior to fieldwork:		
o Private Land: 32BK278, 32MZ3302, 32MZ3306, 32MZ3307, 32MZ3318, 32MZ3323, 32MZ3326, 32MZ3328, 32MZ3329, 32MZ3331, 32WI2390, 32WI2405, 32WI2407, 32WI2409, 32WI2410.	Additional testing (shovel testing and/or the excavation of at least one, 1 x 1 m test unit) was completed at each of these sites in accordance with a testing plan approved by the SHSND. Testing at sites 32WI2390 and 32MZ3328 was suspended following the identification of stone features at these sites; however, the pipeline route has been adjusted to avoid these sites with a minimum 50-ft buffer.	Section 5.3
o US Forest Service Site: 32MZ2346.	While ERM planned to conduct additional testing at this site, the pipeline route was modified prior to this work such that the site is now avoided by the Project with a buffer greater than 100 ft.	Section 5.5
Isolated finds:		
o Discuss subsurface potential on all IFs on a case-by-case basis. If the finds are in a good depositional context, STPs may be necessary to show that these are truly isolates. Minimal site recording may be enough to get a site number for database purposes, but more information is needed to verify that these are truly part of a category that can be written-off as not eligible.	Individual descriptions of isolated finds have been added to the text, including the results of shovel testing or an explanation for why shovel tests were not excavated.	Section 5.7

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Site-by-site comments, private land:		
o 32BK168 – Expand reasoning for Not Eligible Determination both previously and now. Newly recorded site boundary included previously unidentified features. Perhaps site should be unevaluated. Consider formal evaluation and provide updated management recommendations.	ERM conducted site testing at 32BK168 in 2020. Evidence of intact cultural deposits and features was identified during testing and the site is now recommended as eligible for listing in the NRHP. The pipeline route has been modified to avoid this site with a buffer of 57 ft.	Section 5.3
o 32MZ3323 – Discussion mentions "Better Examples" of homesteads. Provide examples.	The description for 32MZ3323 has been updated to incorporate the results of additional testing (shovel testing and the excavation of a 1 x 1 m test unit) in the updated Class III report.	Section 5.3
o 32WI1495 – Actual well shown in Figure 5.3-81 may be visible in figure 5.3-80. Is this location impacted by project? Consider site lead.	The location of the well (which is no longer extant) is discussed in the updated Class III report in conjunction with 32WI1495. ERM has submitted a site lead form for this resource. The suggested boundary of the site lead is 19 ft from Project workspace. The actual location of the well is about 235 ft from Project workspace.	Section 5.3
o 32WI2404 – How is this identified as prehistoric? Could it be a result of natural glacial and/or historic or modern field clearing? Provide evidence. Fence and monitor as necessary.	The interpretation of the feature at 32WI2404 as prehistoric is conservative and based on best professional judgement. Tribal cultural specialists who visited the site with ERM concurred with this interpretation.	Section 5.3
o 32WI2408 – Workspace is extremely close to possible graves. Is the planned route fixed?	The pipeline route has been modified to avoid this site with a buffer of 213 ft.	Section 5.3
Site-by-site comments, US Army Corps of Engineers land:		
o 32MZ976 – Drilling under site is not avoidance as leaks and emergency repairs do consider cultural resources. Formal testing or horizontal avoidance is necessary.	The trajectory of the HDD will be 160 to 180 ft below ground surface where it passes beneath 32WI976. The pipeline will carry gas, not a liquid; the gas would migrate to the surface and dissipate into the air in the event of a leak. Given the depth of the HDD installation, daylighting of the pipeline for repair would not be feasible. If repair is required in the future, the most likely course of action would be to re-install a new segment via HDD, which would require federal authorizations, thereby triggering review of the action under Section 106 of the NHPA. A description of the HDD method has been added to the description of 32WI976 in Section 5.4 of the report. Additional testing at the site is pending and scheduled to be completed this fall. The results will be discussed in an addendum report.	Section 5.4
o 32MZ976 – Show bore location and HDD line on map	A figure showing the HDD alignment with entry and exit points has been added to the description of this site as has a construction alignment sheet. The alignment sheet depicts the HDD in plan and profile.	Section 5.4

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
o 32MZ976 – Clarify and provide more evidence for geomorphological hypothesis of A horizon being related to flood deposits. Typically, A horizons show stability rather than accretional or erosional events. Provide more information on why artifacts are interpreted as disturbed rather than in primary context.	The text in the updated Class III report has been updated to address this comment. As noted above, additional testing is planned to occur at 32WI976 this fall, which will provide additional information on the soils present at the site.	Section 5.4
o 32MZ976 – Did cut bank provide additional information on buried soils? Were artifacts identified in cut bank?	The cut bank was examined during the initial survey. As noted above, additional testing is planned to occur at the site this fall with results to be discussed in an addendum report.	Section 5.4
o 32WI976 – Given size and shape of site, additional TUs recommended.		
Comments from the Bureau of Land Management		
o The recommended protection/avoidance measures for unevaluated and eligible archaeological sites in the Class III report are inadequate, particularly regarding stone feature sites. The usual avoidance distance requested/required by the BLM is 100 feet. More than 100 feet is preferred for stone feature sites. Revise protection/avoidance measures buffers for archaeological sites.	WBI Energy has routed the pipeline to avoid unevaluated and eligible sites with a minimum buffer of 50 ft as directed by the SHSND.	Sections 5.3 through 5.5
o Why were indirect effects to archaeological sites not considered? Setting is an important aspect of integrity for stone feature sites. There are numerous archaeological sites within and near the survey corridor that should be analyzed for indirect effects. Revise the report to address indirect effects to archaeological sites.	The report has been updated to include an assessment of physical and non-physical impacts on unevaluated and eligible sites.	Sections 4 and 5.5 through 5.5
o WBI Energy needs to develop a cultural resource monitoring plan for construction.	WBI Energy commits to preparing a monitoring plan for construction.	Sections 5.3 through 5.5
o Update site form for all sites, site leads, and isolated finds regardless of whether they were relocated. Even if a cultural resource could not be relocated, that is still valuable information for the next project/site visit.	Site form updates have been submitted for all sites, isolated finds, and site leads discussed in the updated Class III report	N/A
o WBI Energy should make additional efforts to involve tribes in upcoming 2020 fieldwork and field reviews.	As discussed in more detail in Section 4 of the updated Class III report, WBI Energy retained Beaver Creek Archaeology to coordinate tribal participation in fieldwork in 2020. BCA worked with tribes to document sites as cultural heritage resources. The results of that work will be presented in a separate report. Information on tribal participation in the surveys also is provided in Sections 4 and 5.3 through 5.5 of ERM's updated Class III report	Sections 4 and 5.3 through 5.5

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Comments from U.S. Army Corps of Engineers		
o In section 5.4.2, remove figures for 32MZ0598 and move to the previous section.	This comment is addressed in the updated Class III report	Section 5.4
o Figure 5.4-5: Map of Site 32WI976, provide contour lines on this map to show the slope. This information would help to explain why the shovel testing pattern appears the way it does.	Contour lines are provided on Figure 5.4-9 in the updated Class III report.	Section 5.4
o ERM, on behalf of WBI [Energy], identified a second concentration of artifacts in the western side of site 32WI0976 after they started excavating the test unit. Some additional testing is needed here as USACE cannot agree with the recommended determination for this site given the data presented in this report.	Additional testing will be completed at this site in the fall of 2020 with the results presented in an addendum report.	Section 5.4
o USACE recommends that WBI [Energy] conduct a remote sensing evaluation (gradiometer or conductivity) at site 32WI0976. This would be the best way to produce measurable data regarding the presence/absence of subsurface features at the site.	A remote sensing survey of the site was completed in the summer of 2020. The results of the survey were used to prepare a testing plan for 32WI976. Additional testing at the site will occur this fall with the results presented in an addendum report.	Section 5.4
Comments from the U.S. Forest Service		
o The map showing previously recorded cultural resources within a one-mile radius is only included in the overall Class III and not in the Forest Service stand-alone report. Please include this in the stand-alone Forest Service report.	This comment is no longer applicable. Survey results for USFS lands are included in the updated Class III inventory report in Section 5.5.	N/A
o Figure 1.1-2 shows the Forest Service surface and differentiates between the survey corridor and the survey corridor on Forest Service surface; however, the survey corridor on Forest Service surface and the actual Forest Service surface displayed don't match.	This comment is no longer applicable. Survey results for USFS lands are included in the updated Class III inventory report in Section 5.5.	N/A
o Sites 32MZ2347 (Historical Archaeological) and 32MZ3278 (Cairn) are located immediately adjacent to the survey corridor but are not discussed. Please discuss.	Based on route modifications, 32MZ3278 was visited in 2020 and the site boundary expanded based on the findings. A discussion of the site is provided in the updated Class III report. 32MZ2347 is outside the inventory corridor for the Project; however, we have included a discussion of this site in the Class III inventory report.	Section 5.5
o Site 32MZ145 site form update does not appear to have been performed. Why? Was an attempt made to actually relocate the site? Also, according to the site form, a THPO representative requested avoidance in 2013. More work on this site is probably needed.	When 32MZ145 was first recorded in 1979, it was characterized as two stone cairns. Subsequent investigations described the site as consisting of a single historic rock clearing pile on the west side of Highway 1806, noting that the second pile was likely destroyed by construction of the highway. ERM's survey in 2019 was limited to the east side of Highway 1806, which explains why we did not relocate the site at that time. In 2020, ERM conducted additional survey on USFS lands, examining a corridor on the west side of Highway 1806. 32MZ145 was relocated as a result of this work. The site is discussed in the updated Class III report. Tribal cultural specialists who accompanied ERM during the 2020 field investigation concurred that 32MZ145 is historic rock clearing pile.	Section 5.5

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
o Site 32MZ2346 and 32MZ144: it is very improbable and therefore suspicious that there are zero artifacts and one artifact respectively at sites with historic dumps.	Sites 32MZ2346 and 32MZ144 are both previously recorded historic sites which ERM revisited and recorded during the survey for the Project. Cultural material was observed at both sites as described in the updated Class III report. ERM expanded the boundaries of 32MZ2346 to encompass two previously unreported features at the site. One artifact–a commemorative coin–was collected from 32MZ2346 because of its uniqueness. No artifacts were collected from 32MZ144. Expanded descriptions of both sites are provided in the updated Class III report.	Section 5.5
o Additional survey is shown as needed near site 32MZ3278 on the maps in the overall Class III report but not in the Forest Service stand-alone report. Please include this in the stand-alone Forest Service report.	Additional survey was completed in 2020 on USFS lands in the vicinity of 32MZ3278, which was relocated. A description of the site is provided in the updated Class III report.	Section 5.5
o The recommended avoidance and fencing measures are inadequate, especially for stone feature sites.	All stone feature sites have been avoided with a minimum buffet of 50 ft. Additionally, for sites between 50 and 100 ft of Project workspace WBI Energy commits to fencing and monitoring the sites during construction. WBI Energy will provide a monitoring plan for agency review.	Section 5.5
o A monitoring plan is needed.	WBI Energy commits to providing a construction monitoring plan as discussed in the updated Class III report.	
o Updates should have been conducted for all sites, site leads, and IFs [isolated finds] regardless of whether or not they were relocated.	Site form updates have been submitted for all applicable sites, isolated finds, and site leads discussed in the report	N/A
o The discussion of site leads during fieldwork is inadequate.	Site leads are discussed in Section 5.6 of the updated Class III report.	Section 5.6
o Provide specific distances between site boundaries and the edge of the workspace.	Distances between sites and Project workspaces have been added to summary tables and site descriptions throughout the updated Class III report.	Sections 5.3 through 5.5
o Provide a map of shovel testing performed outside of site boundaries. The report explains the testing strategy during survey but never discusses or shows specifics except within site boundaries.	The route maps provided as Appendix B depict survey methodology in addition to survey coverage and results.	Appendix B
o Identify the level of tribal involvement in the survey.	Tribal participation in field surveys is discussed in Sections 4 and 5.3 through 5.5 of the updated Class III report.	Sections 4 and 5.3 through 5.5
o Discuss whether indirect effects to archaeological sites were considered.	For unevaluated sites, we have added an assessment of non-physical impacts on setting.	Sections 5.3 through 5.5

Subject: WBI Energy Transmission, Inc.
North Bakken Expansion Project – Class III Survey Reports 2020 Field Season
McKenzie, Williams, Burke, and Mountrail Counties, North Dakota
ND SHPO Ref.: 19-5593

Dear Mr. Rhodd:

Please reference WBI Energy Transmission, Inc.'s (WBI Energy's) previous correspondence regarding the above referenced project. WBI Energy proposes to construct and operate the North Bakken Expansion Project (Project) in McKenzie, Williams, Burke, and Mountrail Counties, North Dakota.

The Project is regulated by the Federal Energy Regulatory Commission (FERC) under Section 7(c) of the Natural Gas Act. Under the Energy Policy Act of 2005, FERC is the lead agency for coordinating federal authorizations and complying with the National Environmental Policy Act on natural gas pipeline projects subject to its jurisdiction. FERC similarly is the lead federal agency for complying with Section 106 of the National Historic Preservation Act (NHPA) on natural gas pipeline projects under its jurisdiction. In accordance with 36 CFR 800.2(c)(4), WBI Energy is assisting the FERC in meeting its obligations under Section 106 of the NHPA by coordinating with agencies and tribes and conducting surveys to identify historic properties that may be affected by the Project.

Enclosed for your review please find Class III survey reports for the archaeological and historic structures surveys that were conducted during the 2019 and 2020 field seasons. The archaeological report includes the results provided in the original Class III report and addresses comments that were provided by the State Historical Society of North Dakota, Bureau of Land Management, U.S. Army Corps of Engineers, and the U.S. Forest Service. The attached table summarizes our response to those comments and provides the location of the relevant revisions or clarifications. A report on geomorphological investigations is also included in this submittal.

WBI Energy would appreciate your comments on the attached reports. If you have any questions or comments on the Project or the reports, please contact me at 612-840-8976 or pat.robblee@erm.com, or Dr. Kevin Malloy at 906-285-0361 or kevin.malloy@erm.com. Please direct written correspondence to Dr. Malloy's attention at:

Attachment: Table summarizing agency comments on the original Class III archaeology report

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Comments from the State Historical Society of North Dakota		
General comments:		
o Provide more background information on sites with previous work. Focus on methods and reasoning for previous eligibility recommendation.	Additional information on previous investigations has been added to site descriptions, as applicable.	Sections 5.3 through 5.7
o Map symbology has item named "Shovel test – No Dig". Are these shovel probes that were planned, but not excavated for some reason? If so provide explanation.	These are planned but unexcavated shovel tests. Site descriptions have been updated, as applicable, to explain why some planned shovel tests were not excavated. Typical reasons for not excavating shovel tests include the presence of buried utilities (documented through One-Call markings) or slope.	Sections 5.3 through 5.5
Avoidance, 50 ft buffer minimum, fence, and monitor:		
o Private land: 32BK277, 32BK279, 32BK280, 32BK282, 32MZ3308, 32MZ3309, 32MZ3310, 32MZ3311, 32MZ3325, 32MZ3327, 32WI1494, 32WI1630, 32WI2144, 32WI2388, 32WI2389, 32WI2391, 32WI2392, 32WI2393, 32WI2394, 32WI2398, 32WI2406, 32WI2408.	Each of these sites is avoided with a minimum 50 ft buffer. Additionally, for sites located between 50 and 100 ft of Project workspace, WBI Energy commits to fencing and monitoring at these locations.	Section 5.3
o US Forest Service Sites: 32MZ3301, 32MZ3314, 32MZ3315, 32MZ3319, 32MZ3320, 32MZ3322, 32MZ3324.	Each of these sites is avoided with a minimum 50 ft buffer. Additionally, for sites located between 50 and 100 ft of Project workspace, WBI Energy commits to fencing and monitoring at these locations.	Section 5.5
Formally evaluate with site delineation and at least one 1x1 m TU. Submit evaluation plan prior to fieldwork:		
o Private Land: 32BK278, 32MZ3302, 32MZ3306, 32MZ3307, 32MZ3318, 32MZ3323, 32MZ3326, 32MZ3328, 32MZ3329, 32MZ3331, 32WI2390, 32WI2405, 32WI2407, 32WI2409, 32WI2410.	Additional testing (shovel testing and/or the excavation of at least one, 1 x 1 m test unit) was completed at each of these sites in accordance with a testing plan approved by the SHSND. Testing at sites 32WI2390 and 32MZ3328 was suspended following the identification of stone features at these sites; however, the pipeline route has been adjusted to avoid these sites with a minimum 50-ft buffer.	Section 5.3
o US Forest Service Site: 32MZ2346.	While ERM planned to conduct additional testing at this site, the pipeline route was modified prior to this work such that the site is now avoided by the Project with a buffer greater than 100 ft.	Section 5.5
Isolated finds:		
o Discuss subsurface potential on all IFs on a case-by-case basis. If the finds are in a good depositional context, STPs may be necessary to show that these are truly isolates. Minimal site recording may be enough to get a site number for database purposes, but more information is needed to verify that these are truly part of a category that can be written-off as not eligible.	Individual descriptions of isolated finds have been added to the text, including the results of shovel testing or an explanation for why shovel tests were not excavated.	Section 5.7

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Site-by-site comments, private land:		
o 32BK168 – Expand reasoning for Not Eligible Determination both previously and now. Newly recorded site boundary included previously unidentified features. Perhaps site should be unevaluated. Consider formal evaluation and provide updated management recommendations.	ERM conducted site testing at 32BK168 in 2020. Evidence of intact cultural deposits and features was identified during testing and the site is now recommended as eligible for listing in the NRHP. The pipeline route has been modified to avoid this site with a buffer of 57 ft.	Section 5.3
o 32MZ3323 – Discussion mentions "Better Examples" of homesteads. Provide examples.	The description for 32MZ3323 has been updated to incorporate the results of additional testing (shovel testing and the excavation of a 1 x 1 m test unit) in the updated Class III report.	Section 5.3
o 32WI1495 – Actual well shown in Figure 5.3-81 may be visible in figure 5.3-80. Is this location impacted by project? Consider site lead.	The location of the well (which is no longer extant) is discussed in the updated Class III report in conjunction with 32WI1495. ERM has submitted a site lead form for this resource. The suggested boundary of the site lead is 19 ft from Project workspace. The actual location of the well is about 235 ft from Project workspace.	Section 5.3
o 32WI2404 – How is this identified as prehistoric? Could it be a result of natural glacial and/or historic or modern field clearing? Provide evidence. Fence and monitor as necessary.	The interpretation of the feature at 32WI2404 as prehistoric is conservative and based on best professional judgement. Tribal cultural specialists who visited the site with ERM concurred with this interpretation.	Section 5.3
o 32WI2408 – Workspace is extremely close to possible graves. Is the planned route fixed?	The pipeline route has been modified to avoid this site with a buffer of 213 ft.	Section 5.3
Site-by-site comments, US Army Corps of Engineers land:		
o 32MZ976 – Drilling under site is not avoidance as leaks and emergency repairs do consider cultural resources. Formal testing or horizontal avoidance is necessary.	The trajectory of the HDD will be 160 to 180 ft below ground surface where it passes beneath 32WI976. The pipeline will carry gas, not a liquid; the gas would migrate to the surface and dissipate into the air in the event of a leak. Given the depth of the HDD installation, daylighting of the pipeline for repair would not be feasible. If repair is required in the future, the most likely course of action would be to re-install a new segment via HDD, which would require federal authorizations, thereby triggering review of the action under Section 106 of the NHPA. A description of the HDD method has been added to the description of 32WI976 in Section 5.4 of the report. Additional testing at the site is pending and scheduled to be completed this fall. The results will be discussed in an addendum report.	Section 5.4
o 32MZ976 – Show bore location and HDD line on map	A figure showing the HDD alignment with entry and exit points has been added to the description of this site as has a construction alignment sheet. The alignment sheet depicts the HDD in plan and profile.	Section 5.4

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
o 32MZ976 – Clarify and provide more evidence for geomorphological hypothesis of A horizon being related to flood deposits. Typically, A horizons show stability rather than accretional or erosional events. Provide more information on why artifacts are interpreted as disturbed rather than in primary context.	The text in the updated Class III report has been updated to address this comment. As noted above, additional testing is planned to occur at 32WI976 this fall, which will provide additional information on the soils present at the site.	Section 5.4
o 32MZ976 – Did cut bank provide additional information on buried soils? Were artifacts identified in cut bank?	The cut bank was examined during the initial survey. As noted above, additional testing is planned to occur at the site this fall with results to be discussed in an addendum report.	Section 5.4
o 32WI976 – Given size and shape of site, additional TUs recommended.		
Comments from the Bureau of Land Management		
o The recommended protection/avoidance measures for unevaluated and eligible archaeological sites in the Class III report are inadequate, particularly regarding stone feature sites. The usual avoidance distance requested/required by the BLM is 100 feet. More than 100 feet is preferred for stone feature sites. Revise protection/avoidance measures buffers for archaeological sites.	WBI Energy has routed the pipeline to avoid unevaluated and eligible sites with a minimum buffer of 50 ft as directed by the SHSND.	Sections 5.3 through 5.5
o Why were indirect effects to archaeological sites not considered? Setting is an important aspect of integrity for stone feature sites. There are numerous archaeological sites within and near the survey corridor that should be analyzed for indirect effects. Revise the report to address indirect effects to archaeological sites.	The report has been updated to include an assessment of physical and non-physical impacts on unevaluated and eligible sites.	Sections 4 and 5.5 through 5.5
o WBI Energy needs to develop a cultural resource monitoring plan for construction.	WBI Energy commits to preparing a monitoring plan for construction.	Sections 5.3 through 5.5
o Update site form for all sites, site leads, and isolated finds regardless of whether they were relocated. Even if a cultural resource could not be relocated, that is still valuable information for the next project/site visit.	Site form updates have been submitted for all sites, isolated finds, and site leads discussed in the updated Class III report	N/A
o WBI Energy should make additional efforts to involve tribes in upcoming 2020 fieldwork and field reviews.	As discussed in more detail in Section 4 of the updated Class III report, WBI Energy retained Beaver Creek Archaeology to coordinate tribal participation in fieldwork in 2020. BCA worked with tribes to document sites as cultural heritage resources. The results of that work will be presented in a separate report. Information on tribal participation in the surveys also is provided in Sections 4 and 5.3 through 5.5 of ERM's updated Class III report	Sections 4 and 5.3 through 5.5

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Comments from U.S. Army Corps of Engineers		
o In section 5.4.2, remove figures for 32MZ0598 and move to the previous section.	This comment is addressed in the updated Class III report	Section 5.4
o Figure 5.4-5: Map of Site 32WI976, provide contour lines on this map to show the slope. This information would help to explain why the shovel testing pattern appears the way it does.	Contour lines are provided on Figure 5.4-9 in the updated Class III report.	Section 5.4
o ERM, on behalf of WBI [Energy], identified a second concentration of artifacts in the western side of site 32WI0976 after they started excavating the test unit. Some additional testing is needed here as USACE cannot agree with the recommended determination for this site given the data presented in this report.	Additional testing will be completed at this site in the fall of 2020 with the results presented in an addendum report.	Section 5.4

MEETING NOTES

LOG OF IN PERSON MEETING

MEETING ATTENDEES:

Jon Eagle – Standing Rock Sioux Tribe Tribal Historic Preservation Officer
Ben Rhodd – Rosebud Sioux Tribe Archaeologist
Katie West – Bureau of Land Management (BLM)
Jill Linn – WBI Energy Transmission, Inc. (WBI Energy)
Wade Burns – Beaver Creek Archaeology (BCA)
Raina Hanley – BCA
Larry Pallozzi – BCA
Jayson Zoino – Environmental Resource Group (ERM)

DATE:	TIME OF CONVERSATION:
September 17, 2020	10 am to 1 pm

RE:

North Bakken Expansion Project

LOG OF CONVERSATION:

ERM visited sites 32MZ3382, 32MZ3383, and 32MZ3385 on U.S. Forest Service lands with representatives of the Standing Rock Sioux Tribe, Rosebud Sioux Tribe, BLM, WBI Energy, and BCA.[1] ERM documented these sites in the summer of 2020 during survey for WBI Energy's North Bakken Expansion Project. Tribal cultural specialists representing the Standing Rock Sioux Tribe, Rosebud Sioux Tribe (including one specialist working on behalf of the Sisseton Wahpeton Oyate Tribe), Assiniboine & Sioux Tribes, and Turtle Mountain Band of Chippewa Indians monitored ERM's delineation of the sites; however, the specialists did not uniformly concur with the interpretation of the finds as archaeological. Some of the specialists concluded that the remains documented by ERM are non-cultural.

The visits to 32MZ3382, 32MZ3383, and 32MZ3385 allowed Mr. Eagle and Mr. Rhodd to inspect the sites and features recorded by ERM. Mr. Eagle and Mr. Rhodd each concurred with the interpretation of the finds as archaeological and agreed with a majority of ERM's feature classifications for the sites. Mr. Eagle and Mr. Rhodd provided additional interpretation of some features, which will be incorporated into the cultural heritage forms for these sites. This includes an expansion of the area at 32MZ3383 to be recorded as a cultural heritage site to encompass a cluster of Echinacea identified near the archaeological features.

[1] The U.S. Forest Service was unable to participate in the site visits.

Tom Brings, Tribal Historic Preservation Officer
Oglala Sioux Tribe
PO Box 320
Pine Ridge, SD 57770-2070

Subject: WBI Energy Transmission, Inc.
North Bakken Expansion Project – Class III Survey Reports 2020 Field Season
McKenzie, Williams, Burke, and Mountrail Counties, North Dakota
ND SHPO Ref.: 19-5593

Dear Mr. Brings:

Please reference WBI Energy Transmission, Inc.'s (WBI Energy's) previous correspondence regarding the above referenced project. WBI Energy proposes to construct and operate the North Bakken Expansion Project (Project) in McKenzie, Williams, Burke, and Mountrail Counties, North Dakota.

The Project is regulated by the Federal Energy Regulatory Commission (FERC) under Section 7(c) of the Natural Gas Act. Under the Energy Policy Act of 2005, FERC is the lead agency for coordinating federal authorizations and complying with the National Environmental Policy Act on natural gas pipeline projects subject to its jurisdiction. FERC similarly is the lead federal agency for complying with Section 106 of the National Historic Preservation Act (NHPA) on natural gas pipeline projects under its jurisdiction. In accordance with 36 CFR 800.2(c)(4), WBI Energy is assisting the FERC in meeting its obligations under Section 106 of the NHPA by coordinating with agencies and tribes and conducting surveys to identify historic properties that may be affected by the Project.

Enclosed for your review please find Class III survey reports for the archaeological and historic structures surveys that were conducted during the 2019 and 2020 field seasons. The archaeological report includes the results provided in the original Class III report and addresses comments that were provided by the State Historical Society of North Dakota, Bureau of Land Management, U.S. Army Corps of Engineers, and the U.S. Forest Service. The attached table summarizes our response to those comments and provides the location of the relevant revisions or clarifications. A report on geomorphological investigations is also included in this submittal.

WBI Energy would appreciate your comments on the attached reports. If you have any questions or comments on the Project or the reports, please contact me at 612-840-8976 or pat.robblee@erm.com, or Dr. Kevin Malloy at 906-285-0361 or kevin.malloy@erm.com. Please direct written correspondence to Dr. Malloy's attention at:

Environmental Resources Management
1000 IDS Center
80 South 8th Street
Minneapolis, MN 55402

Sincerely,

Patrick Robblee

Program Director

Attachment: Table summarizing agency comments on the original Class III archaeology report

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Comments from the State Historical Society of North Dakota		
General comments:		
o Provide more background information on sites with previous work. Focus on methods and reasoning for previous eligibility recommendation.	Additional information on previous investigations has been added to site descriptions, as applicable.	Sections 5.3 through 5.7
o Map symbology has item named "Shovel test – No Dig". Are these shovel probes that were planned, but not excavated for some reason? If so provide explanation.	These are planned but unexcavated shovel tests. Site descriptions have been updated, as applicable, to explain why some planned shovel tests were not excavated. Typical reasons for not excavating shovel tests include the presence of buried utilities (documented through One-Call markings) or slope.	Sections 5.3 through 5.5
Avoidance, 50 ft buffer minimum, fence, and monitor:		
o Private land: 32BK277, 32BK279, 32BK280, 32BK282, 32MZ3308, 32MZ3309, 32MZ3310, 32MZ3311, 32MZ3325, 32MZ3327, 32WI1494, 32WI1630, 32WI2144, 32WI2388, 32WI2389, 32WI2391, 32WI2392, 32WI2393, 32WI2394, 32WI2398, 32WI2406, 32WI2408.	Each of these sites is avoided with a minimum 50 ft buffer. Additionally, for sites located between 50 and 100 ft of Project workspace, WBI Energy commits to fencing and monitoring at these locations.	Section 5.3
o US Forest Service Sites: 32MZ3301, 32MZ3314, 32MZ3315, 32MZ3319, 32MZ3320, 32MZ3322, 32MZ3324.	Each of these sites is avoided with a minimum 50 ft buffer. Additionally, for sites located between 50 and 100 ft of Project workspace, WBI Energy commits to fencing and monitoring at these locations.	Section 5.5
Formally evaluate with site delineation and at least one 1x1 m TU. Submit evaluation plan prior to fieldwork:		
o Private Land: 32BK278, 32MZ3302, 32MZ3306, 32MZ3307, 32MZ3318, 32MZ3323, 32MZ3326, 32MZ3328, 32MZ3329, 32MZ3331, 32WI2390, 32WI2405, 32WI2407, 32WI2409, 32WI2410.	Additional testing (shovel testing and/or the excavation of at least one, 1 x 1 m test unit) was completed at each of these sites in accordance with a testing plan approved by the SHSND. Testing at sites 32WI2390 and 32MZ3328 was suspended following the identification of stone features at these sites; however, the pipeline route has been adjusted to avoid these sites with a minimum 50-ft buffer.	Section 5.3
o US Forest Service Site: 32MZ2346.	While ERM planned to conduct additional testing at this site, the pipeline route was modified prior to this work such that the site is now avoided by the Project with a buffer greater than 100 ft.	Section 5.5
Isolated finds:		
o Discuss subsurface potential on all IFs on a case-by-case basis. If the finds are in a good depositional context, STPs may be necessary to show that these are truly isolates. Minimal site recording may be enough to get a site number for database purposes, but more information is needed to verify that these are truly part of a category that can be written-off as not eligible.	Individual descriptions of isolated finds have been added to the text, including the results of shovel testing or an explanation for why shovel tests were not excavated.	Section 5.7

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Site-by-site comments, private land:		
o 32BK168 – Expand reasoning for Not Eligible Determination both previously and now. Newly recorded site boundary included previously unidentified features. Perhaps site should be unevaluated. Consider formal evaluation and provide updated management recommendations.	ERM conducted site testing at 32BK168 in 2020. Evidence of intact cultural deposits and features was identified during testing and the site is now recommended as eligible for listing in the NRHP. The pipeline route has been modified to avoid this site with a buffer of 57 ft.	Section 5.3
o 32MZ3323 – Discussion mentions "Better Examples" of homesteads. Provide examples.	The description for 32MZ3323 has been updated to incorporate the results of additional testing (shovel testing and the excavation of a 1 x 1 m test unit) in the updated Class III report.	Section 5.3
o 32WI1495 – Actual well shown in Figure 5.3-81 may be visible in figure 5.3-80. Is this location impacted by project? Consider site lead.	The location of the well (which is no longer extant) is discussed in the updated Class III report in conjunction with 32WI1495. ERM has submitted a site lead form for this resource. The suggested boundary of the site lead is 19 ft from Project workspace. The actual location of the well is about 235 ft from Project workspace.	Section 5.3
o 32WI2404 – How is this identified as prehistoric? Could it be a result of natural glacial and/or historic or modern field clearing? Provide evidence. Fence and monitor as necessary.	The interpretation of the feature at 32WI2404 as prehistoric is conservative and based on best professional judgement. Tribal cultural specialists who visited the site with ERM concurred with this interpretation.	Section 5.3
o 32WI2408 – Workspace is extremely close to possible graves. Is the planned route fixed?	The pipeline route has been modified to avoid this site with a buffer of 213 ft.	Section 5.3
Site-by-site comments, US Army Corps of Engineers land:		
o 32MZ976 – Drilling under site is not avoidance as leaks and emergency repairs do consider cultural resources. Formal testing or horizontal avoidance is necessary.	The trajectory of the HDD will be 160 to 180 ft below ground surface where it passes beneath 32WI976. The pipeline will carry gas, not a liquid; the gas would migrate to the surface and dissipate into the air in the event of a leak. Given the depth of the HDD installation, daylighting of the pipeline for repair would not be feasible. If repair is required in the future, the most likely course of action would be to re-install a new segment via HDD, which would require federal authorizations, thereby triggering review of the action under Section 106 of the NHPA. A description of the HDD method has been added to the description of 32WI976 in Section 5.4 of the report. Additional testing at the site is pending and scheduled to be completed this fall. The results will be discussed in an addendum report.	Section 5.4
o 32MZ976 – Show bore location and HDD line on map	A figure showing the HDD alignment with entry and exit points has been added to the description of this site as has a construction alignment sheet. The alignment sheet depicts the HDD in plan and profile.	Section 5.4

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
o 32MZ976 – Clarify and provide more evidence for geomorphological hypothesis of A horizon being related to flood deposits. Typically, A horizons show stability rather than accretional or erosional events. Provide more information on why artifacts are interpreted as disturbed rather than in primary context.	The text in the updated Class III report has been updated to address this comment. As noted above, additional testing is planned to occur at 32WI976 this fall, which will provide additional information on the soils present at the site.	Section 5.4
o 32MZ976 – Did cut bank provide additional information on buried soils? Were artifacts identified in cut bank?	The cut bank was examined during the initial survey. As noted above, additional testing is planned to occur at the site this fall with results to be discussed in an addendum report.	Section 5.4
o 32WI976 – Given size and shape of site, additional TUs recommended.		
Comments from the Bureau of Land Management		
o The recommended protection/avoidance measures for unevaluated and eligible archaeological sites in the Class III report are inadequate, particularly regarding stone feature sites. The usual avoidance distance requested/required by the BLM is 100 feet. More than 100 feet is preferred for stone feature sites. Revise protection/avoidance measures buffers for archaeological sites.	WBI Energy has routed the pipeline to avoid unevaluated and eligible sites with a minimum buffer of 50 ft as directed by the SHSND.	Sections 5.3 through 5.5
o Why were indirect effects to archaeological sites not considered? Setting is an important aspect of integrity for stone feature sites. There are numerous archaeological sites within and near the survey corridor that should be analyzed for indirect effects. Revise the report to address indirect effects to archaeological sites.	The report has been updated to include an assessment of physical and non-physical impacts on unevaluated and eligible sites.	Sections 4 and 5.5 through 5.5
o WBI Energy needs to develop a cultural resource monitoring plan for construction.	WBI Energy commits to preparing a monitoring plan for construction.	Sections 5.3 through 5.5
o Update site form for all sites, site leads, and isolated finds regardless of whether they were relocated. Even if a cultural resource could not be relocated, that is still valuable information for the next project/site visit.	Site form updates have been submitted for all sites, isolated finds, and site leads discussed in the updated Class III report	N/A
o WBI Energy should make additional efforts to involve tribes in upcoming 2020 fieldwork and field reviews.	As discussed in more detail in Section 4 of the updated Class III report, WBI Energy retained Beaver Creek Archaeology to coordinate tribal participation in fieldwork in 2020. BCA worked with tribes to document sites as cultural heritage resources. The results of that work will be presented in a separate report. Information on tribal participation in the surveys also is provided in Sections 4 and 5.3 through 5.5 of ERM's updated Class III report	Sections 4 and 5.3 through 5.5

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Comments from U.S. Army Corps of Engineers		
o In section 5.4.2, remove figures for 32MZ0598 and move to the previous section.	This comment is addressed in the updated Class III report	Section 5.4
o Figure 5.4-5: Map of Site 32WI976, provide contour lines on this map to show the slope. This information would help to explain why the shovel testing pattern appears the way it does.	Contour lines are provided on Figure 5.4-9 in the updated Class III report.	Section 5.4
o ERM, on behalf of WBI [Energy], identified a second concentration of artifacts in the western side of site 32WI0976 after they started excavating the test unit. Some additional testing is needed here as USACE cannot agree with the recommended determination for this site given the data presented in this report.	Additional testing will be completed at this site in the fall of 2020 with the results presented in an addendum report.	Section 5.4
o USACE recommends that WBI [Energy] conduct a remote sensing evaluation (gradiometer or conductivity) at site 32WI0976. This would be the best way to produce measurable data regarding the presence/absence of subsurface features at the site.	A remote sensing survey of the site was completed in the summer of 2020. The results of the survey were used to prepare a testing plan for 32WI976. Additional testing at the site will occur this fall with the results presented in an addendum report.	Section 5.4
Comments from the U.S. Forest Service		
o The map showing previously recorded cultural resources within a one-mile radius is only included in the overall Class III and not in the Forest Service stand-alone report. Please include this in the stand-alone Forest Service report.	This comment is no longer applicable. Survey results for USFS lands are included in the updated Class III inventory report in Section 5.5.	N/A
o Figure 1.1-2 shows the Forest Service surface and differentiates between the survey corridor and the survey corridor on Forest Service surface; however, the survey corridor on Forest Service surface and the actual Forest Service surface displayed don't match.	This comment is no longer applicable. Survey results for USFS lands are included in the updated Class III inventory report in Section 5.5.	N/A
o Sites 32MZ2347 (Historical Archaeological) and 32MZ3278 (Cairn) are located immediately adjacent to the survey corridor but are not discussed. Please discuss.	Based on route modifications, 32MZ3278 was visited in 2020 and the site boundary expanded based on the findings. A discussion of the site is provided in the updated Class III report. 32MZ2347 is outside the inventory corridor for the Project; however, we have included a discussion of this site in the Class III inventory report.	Section 5.5
o Site 32MZ145 site form update does not appear to have been performed. Why? Was an attempt made to actually relocate the site? Also, according to the site form, a THPO representative requested avoidance in 2013. More work on this site is probably needed.	When 32MZ145 was first recorded in 1979, it was characterized as two stone cairns. Subsequent investigations described the site as consisting of a single historic rock clearing pile on the west side of Highway 1806, noting that the second pile was likely destroyed by construction of the highway. ERM's survey in 2019 was limited to the east side of Highway 1806, which explains why we did not relocate the site at that time. In 2020, ERM conducted additional survey on USFS lands, examining a corridor on the west side of Highway 1806. 32MZ145 was relocated as a result of this work. The site is discussed in the updated Class III report. Tribal cultural specialists who accompanied ERM during the 2020 field investigation concurred that 32MZ145 is historic rock clearing pile.	Section 5.5

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
o Site 32MZ2346 and 32MZ144: it is very improbable and therefore suspicious that there are zero artifacts and one artifact respectively at sites with historic dumps.	Sites 32MZ2346 and 32MZ144 are both previously recorded historic sites which ERM revisited and recorded during the survey for the Project. Cultural material was observed at both sites as described in the updated Class III report. ERM expanded the boundaries of 32MZ2346 to encompass two previously unreported features at the site. One artifact–a commemorative coin–was collected from 32MZ2346 because of its uniqueness. No artifacts were collected from 32MZ144. Expanded descriptions of both sites are provided in the updated Class III report.	Section 5.5
o Additional survey is shown as needed near site 32MZ3278 on the maps in the overall Class III report but not in the Forest Service stand-alone report. Please include this in the stand-alone Forest Service report.	Additional survey was completed in 2020 on USFS lands in the vicinity of 32MZ3278, which was relocated. A description of the site is provided in the updated Class III report.	Section 5.5
o The recommended avoidance and fencing measures are inadequate, especially for stone feature sites.	All stone feature sites have been avoided with a minimum buffet of 50 ft. Additionally, for sites between 50 and 100 ft of Project workspace WBI Energy commits to fencing and monitoring the sites during construction. WBI Energy will provide a monitoring plan for agency review.	Section 5.5
o A monitoring plan is needed.	WBI Energy commits to providing a construction monitoring plan as discussed in the updated Class III report.	
o Updates should have been conducted for all sites, site leads, and IFs [isolated finds] regardless of whether or not they were relocated.	Site form updates have been submitted for all applicable sites, isolated finds, and site leads discussed in the report	N/A
o The discussion of site leads during fieldwork is inadequate.	Site leads are discussed in Section 5.6 of the updated Class III report.	Section 5.6
o Provide specific distances between site boundaries and the edge of the workspace.	Distances between sites and Project workspaces have been added to summary tables and site descriptions throughout the updated Class III report.	Sections 5.3 through 5.5
o Provide a map of shovel testing performed outside of site boundaries. The report explains the testing strategy during survey but never discusses or shows specifics except within site boundaries.	The route maps provided as Appendix B depict survey methodology in addition to survey coverage and results.	Appendix B
o Identify the level of tribal involvement in the survey.	Tribal participation in field surveys is discussed in Sections 4 and 5.3 through 5.5 of the updated Class III report.	Sections 4 and 5.3 through 5.5
o Discuss whether indirect effects to archaeological sites were considered.	For unevaluated sites, we have added an assessment of non-physical impacts on setting.	Sections 5.3 through 5.5

Subject: WBI Energy Transmission, Inc.
North Bakken Expansion Project – Class III Survey Reports 2020 Field Season
McKenzie, Williams, Burke, and Mountrail Counties, North Dakota
ND SHPO Ref.: 19-5593

Dear Mr. Ridgely:

Please reference WBI Energy Transmission, Inc.'s (WBI Energy's) previous correspondence regarding the above referenced project. WBI Energy proposes to construct and operate the North Bakken Expansion Project (Project) in McKenzie, Williams, Burke, and Mountrail Counties, North Dakota.

The Project is regulated by the Federal Energy Regulatory Commission (FERC) under Section 7(c) of the Natural Gas Act. Under the Energy Policy Act of 2005, FERC is the lead agency for coordinating federal authorizations and complying with the National Environmental Policy Act on natural gas pipeline projects subject to its jurisdiction. FERC similarly is the lead federal agency for complying with Section 106 of the National Historic Preservation Act (NHPA) on natural gas pipeline projects under its jurisdiction. In accordance with 36 CFR 800.2(c)(4), WBI Energy is assisting the FERC in meeting its obligations under Section 106 of the NHPA by coordinating with agencies and tribes and conducting surveys to identify historic properties that may be affected by the Project.

Enclosed for your review please find Class III survey reports for the archaeological and historic structures surveys that were conducted during the 2019 and 2020 field seasons. The archaeological report includes the results provided in the original Class III report and addresses comments that were provided by the State Historical Society of North Dakota, Bureau of Land Management, U.S. Army Corps of Engineers, and the U.S. Forest Service. The attached table summarizes our response to those comments and provides the location of the relevant revisions or clarifications. A report on geomorphological investigations is also included in this submittal.

WBI Energy would appreciate your comments on the attached reports. If you have any questions or comments on the Project or the reports, please contact me at 612-840-8976 or pat.robblee@erm.com, or Dr. Kevin Malloy at 906-285-0361 or kevin.malloy@erm.com. Please direct written correspondence to Dr. Malloy's attention at:

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Comments from the State Historical Society of North Dakota		
General comments:		
o Provide more background information on sites with previous work. Focus on methods and reasoning for previous eligibility recommendation.	Additional information on previous investigations has been added to site descriptions, as applicable.	Sections 5.3 through 5.7
o Map symbology has item named "Shovel test – No Dig". Are these shovel probes that were planned, but not excavated for some reason? If so provide explanation.	These are planned but unexcavated shovel tests. Site descriptions have been updated, as applicable, to explain why some planned shovel tests were not excavated. Typical reasons for not excavating shovel tests include the presence of buried utilities (documented through One-Call markings) or slope.	Sections 5.3 through 5.5
Avoidance, 50 ft buffer minimum, fence, and monitor:		
o Private land: 32BK277, 32BK279, 32BK280, 32BK282, 32MZ3308, 32MZ3309, 32MZ3310, 32MZ3311, 32MZ3325, 32MZ3327, 32WI1494, 32WI1630, 32WI2144, 32WI2388, 32WI2389, 32WI2391, 32WI2392, 32WI2393, 32WI2394, 32WI2398, 32WI2406, 32WI2408.	Each of these sites is avoided with a minimum 50 ft buffer. Additionally, for sites located between 50 and 100 ft of Project workspace, WBI Energy commits to fencing and monitoring at these locations.	Section 5.3
o US Forest Service Sites: 32MZ3301, 32MZ3314, 32MZ3315, 32MZ3319, 32MZ3320, 32MZ3322, 32MZ3324.	Each of these sites is avoided with a minimum 50 ft buffer. Additionally, for sites located between 50 and 100 ft of Project workspace, WBI Energy commits to fencing and monitoring at these locations.	Section 5.5
Formally evaluate with site delineation and at least one 1x1 m TU. Submit evaluation plan prior to fieldwork:		
o Private Land: 32BK278, 32MZ3302, 32MZ3306, 32MZ3307, 32MZ3318, 32MZ3323, 32MZ3326, 32MZ3328, 32MZ3329, 32MZ3331, 32WI2390, 32WI2405, 32WI2407, 32WI2409, 32WI2410.	Additional testing (shovel testing and/or the excavation of at least one, 1 x 1 m test unit) was completed at each of these sites in accordance with a testing plan approved by the SHSND. Testing at sites 32WI2390 and 32MZ3328 was suspended following the identification of stone features at these sites; however, the pipeline route has been adjusted to avoid these sites with a minimum 50-ft buffer.	Section 5.3
o US Forest Service Site: 32MZ2346.	While ERM planned to conduct additional testing at this site, the pipeline route was modified prior to this work such that the site is now avoided by the Project with a buffer greater than 100 ft.	Section 5.5
Isolated finds:		
o Discuss subsurface potential on all IFs on a case-by-case basis. If the finds are in a good depositional context, STPs may be necessary to show that these are truly isolates. Minimal site recording may be enough to get a site number for database purposes, but more information is needed to verify that these are truly part of a category that can be written-off as not eligible.	Individual descriptions of isolated finds have been added to the text, including the results of shovel testing or an explanation for why shovel tests were not excavated.	Section 5.7

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Site-by-site comments, private land:		
o 32BK168 – Expand reasoning for Not Eligible Determination both previously and now. Newly recorded site boundary included previously unidentified features. Perhaps site should be unevaluated. Consider formal evaluation and provide updated management recommendations.	ERM conducted site testing at 32BK168 in 2020. Evidence of intact cultural deposits and features was identified during testing and the site is now recommended as eligible for listing in the NRHP. The pipeline route has been modified to avoid this site with a buffer of 57 ft.	Section 5.3
o 32MZ3323 – Discussion mentions "Better Examples" of homesteads. Provide examples.	The description for 32MZ3323 has been updated to incorporate the results of additional testing (shovel testing and the excavation of a 1 x 1 m test unit) in the updated Class III report.	Section 5.3
o 32WI1495 – Actual well shown in Figure 5.3-81 may be visible in figure 5.3-80. Is this location impacted by project? Consider site lead.	The location of the well (which is no longer extant) is discussed in the updated Class III report in conjunction with 32WI1495. ERM has submitted a site lead form for this resource. The suggested boundary of the site lead is 19 ft from Project workspace. The actual location of the well is about 235 ft from Project workspace.	Section 5.3
o 32WI2404 – How is this identified as prehistoric? Could it be a result of natural glacial and/or historic or modern field clearing? Provide evidence. Fence and monitor as necessary.	The interpretation of the feature at 32WI2404 as prehistoric is conservative and based on best professional judgement. Tribal cultural specialists who visited the site with ERM concurred with this interpretation.	Section 5.3
o 32WI2408 – Workspace is extremely close to possible graves. Is the planned route fixed?	The pipeline route has been modified to avoid this site with a buffer of 213 ft.	Section 5.3
Site-by-site comments, US Army Corps of Engineers land:		
o 32MZ976 – Drilling under site is not avoidance as leaks and emergency repairs do consider cultural resources. Formal testing or horizontal avoidance is necessary.	The trajectory of the HDD will be 160 to 180 ft below ground surface where it passes beneath 32WI976. The pipeline will carry gas, not a liquid; the gas would migrate to the surface and dissipate into the air in the event of a leak. Given the depth of the HDD installation, daylighting of the pipeline for repair would not be feasible. If repair is required in the future, the most likely course of action would be to re-install a new segment via HDD, which would require federal authorizations, thereby triggering review of the action under Section 106 of the NHPA. A description of the HDD method has been added to the description of 32WI976 in Section 5.4 of the report. Additional testing at the site is pending and scheduled to be completed this fall. The results will be discussed in an addendum report.	Section 5.4
o 32MZ976 – Show bore location and HDD line on map	A figure showing the HDD alignment with entry and exit points has been added to the description of this site as has a construction alignment sheet. The alignment sheet depicts the HDD in plan and profile.	Section 5.4

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
o 32MZ976 – Clarify and provide more evidence for geomorphological hypothesis of A horizon being related to flood deposits. Typically, A horizons show stability rather than accretional or erosional events. Provide more information on why artifacts are interpreted as disturbed rather than in primary context.	The text in the updated Class III report has been updated to address this comment. As noted above, additional testing is planned to occur at 32WI976 this fall, which will provide additional information on the soils present at the site.	Section 5.4
o 32MZ976 – Did cut bank provide additional information on buried soils? Were artifacts identified in cut bank?	The cut bank was examined during the initial survey. As noted above, additional testing is planned to occur at the site this fall with results to be discussed in an addendum report.	Section 5.4
o 32WI976 – Given size and shape of site, additional TUs recommended.		
Comments from the Bureau of Land Management		
o The recommended protection/avoidance measures for unevaluated and eligible archaeological sites in the Class III report are inadequate, particularly regarding stone feature sites. The usual avoidance distance requested/required by the BLM is 100 feet. More than 100 feet is preferred for stone feature sites. Revise protection/avoidance measures buffers for archaeological sites.	WBI Energy has routed the pipeline to avoid unevaluated and eligible sites with a minimum buffer of 50 ft as directed by the SHSND.	Sections 5.3 through 5.5
o Why were indirect effects to archaeological sites not considered? Setting is an important aspect of integrity for stone feature sites. There are numerous archaeological sites within and near the survey corridor that should be analyzed for indirect effects. Revise the report to address indirect effects to archaeological sites.	The report has been updated to include an assessment of physical and non-physical impacts on unevaluated and eligible sites.	Sections 4 and 5.5 through 5.5
o WBI Energy needs to develop a cultural resource monitoring plan for construction.	WBI Energy commits to preparing a monitoring plan for construction.	Sections 5.3 through 5.5
o Update site form for all sites, site leads, and isolated finds regardless of whether they were relocated. Even if a cultural resource could not be relocated, that is still valuable information for the next project/site visit.	Site form updates have been submitted for all sites, isolated finds, and site leads discussed in the updated Class III report	N/A
o WBI Energy should make additional efforts to involve tribes in upcoming 2020 fieldwork and field reviews.	As discussed in more detail in Section 4 of the updated Class III report, WBI Energy retained Beaver Creek Archaeology to coordinate tribal participation in fieldwork in 2020. BCA worked with tribes to document sites as cultural heritage resources. The results of that work will be presented in a separate report. Information on tribal participation in the surveys also is provided in Sections 4 and 5.3 through 5.5 of ERM's updated Class III report	Sections 4 and 5.3 through 5.5

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Comments from U.S. Army Corps of Engineers		
o In section 5.4.2, remove figures for 32MZ0598 and move to the previous section.	This comment is addressed in the updated Class III report	Section 5.4
o Figure 5.4-5: Map of Site 32WI976, provide contour lines on this map to show the slope. This information would help to explain why the shovel testing pattern appears the way it does.	Contour lines are provided on Figure 5.4-9 in the updated Class III report.	Section 5.4
o ERM, on behalf of WBI [Energy], identified a second concentration of artifacts in the western side of site 32WI0976 after they started excavating the test unit. Some additional testing is needed here as USACE cannot agree with the recommended determination for this site given the data presented in this report.	Additional testing will be completed at this site in the fall of 2020 with the results presented in an addendum report.	Section 5.4
o USACE recommends that WBI [Energy] conduct a remote sensing evaluation (gradiometer or conductivity) at site 32WI0976. This would be the best way to produce measurable data regarding the presence/absence of subsurface features at the site.	A remote sensing survey of the site was completed in the summer of 2020. The results of the survey were used to prepare a testing plan for 32WI976. Additional testing at the site will occur this fall with the results presented in an addendum report.	Section 5.4
Comments from the U.S. Forest Service		
o The map showing previously recorded cultural resources within a one-mile radius is only included in the overall Class III and not in the Forest Service stand-alone report. Please include this in the stand-alone Forest Service report.	This comment is no longer applicable. Survey results for USFS lands are included in the updated Class III inventory report in Section 5.5.	N/A
o Figure 1.1-2 shows the Forest Service surface and differentiates between the survey corridor and the survey corridor on Forest Service surface; however, the survey corridor on Forest Service surface and the actual Forest Service surface displayed don't match.	This comment is no longer applicable. Survey results for USFS lands are included in the updated Class III inventory report in Section 5.5.	N/A
o Sites 32MZ2347 (Historical Archaeological) and 32MZ3278 (Cairn) are located immediately adjacent to the survey corridor but are not discussed. Please discuss.	Based on route modifications, 32MZ3278 was visited in 2020 and the site boundary expanded based on the findings. A discussion of the site is provided in the updated Class III report. 32MZ2347 is outside the inventory corridor for the Project; however, we have included a discussion of this site in the Class III inventory report.	Section 5.5
o Site 32MZ145 site form update does not appear to have been performed. Why? Was an attempt made to actually relocate the site? Also, according to the site form, a THPO representative requested avoidance in 2013. More work on this site is probably needed.	When 32MZ145 was first recorded in 1979, it was characterized as two stone cairns. Subsequent investigations described the site as consisting of a single historic rock clearing pile on the west side of Highway 1806, noting that the second pile was likely destroyed by construction of the highway. ERM's survey in 2019 was limited to the east side of Highway 1806, which explains why we did not relocate the site at that time. In 2020, ERM conducted additional survey on USFS lands, examining a corridor on the west side of Highway 1806. 32MZ145 was relocated as a result of this work. The site is discussed in the updated Class III report. Tribal cultural specialists who accompanied ERM during the 2020 field investigation concurred that 32MZ145 is historic rock clearing pile.	Section 5.5

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
o Site 32MZ2346 and 32MZ144: it is very improbable and therefore suspicious that there are zero artifacts and one artifact respectively at sites with historic dumps.	Sites 32MZ2346 and 32MZ144 are both previously recorded historic sites which ERM revisited and recorded during the survey for the Project. Cultural material was observed at both sites as described in the updated Class III report. ERM expanded the boundaries of 32MZ2346 to encompass two previously unreported features at the site. One artifact–a commemorative coin–was collected from 32MZ2346 because of its uniqueness. No artifacts were collected from 32MZ144. Expanded descriptions of both sites are provided in the updated Class III report.	Section 5.5
o Additional survey is shown as needed near site 32MZ3278 on the maps in the overall Class III report but not in the Forest Service stand-alone report. Please include this in the stand-alone Forest Service report.	Additional survey was completed in 2020 on USFS lands in the vicinity of 32MZ3278, which was relocated. A description of the site is provided in the updated Class III report.	Section 5.5
o The recommended avoidance and fencing measures are inadequate, especially for stone feature sites.	All stone feature sites have been avoided with a minimum buffet of 50 ft. Additionally, for sites between 50 and 100 ft of Project workspace WBI Energy commits to fencing and monitoring the sites during construction. WBI Energy will provide a monitoring plan for agency review.	Section 5.5
o A monitoring plan is needed.	WBI Energy commits to providing a construction monitoring plan as discussed in the updated Class III report.	
o Updates should have been conducted for all sites, site leads, and IFs [isolated finds] regardless of whether or not they were relocated.	Site form updates have been submitted for all applicable sites, isolated finds, and site leads discussed in the report	N/A
o The discussion of site leads during fieldwork is inadequate.	Site leads are discussed in Section 5.6 of the updated Class III report.	Section 5.6
o Provide specific distances between site boundaries and the edge of the workspace.	Distances between sites and Project workspaces have been added to summary tables and site descriptions throughout the updated Class III report.	Sections 5.3 through 5.5
o Provide a map of shovel testing performed outside of site boundaries. The report explains the testing strategy during survey but never discusses or shows specifics except within site boundaries.	The route maps provided as Appendix B depict survey methodology in addition to survey coverage and results.	Appendix B
o Identify the level of tribal involvement in the survey.	Tribal participation in field surveys is discussed in Sections 4 and 5.3 through 5.5 of the updated Class III report.	Sections 4 and 5.3 through 5.5
o Discuss whether indirect effects to archaeological sites were considered.	For unevaluated sites, we have added an assessment of non-physical impacts on setting.	Sections 5.3 through 5.5

Subject: WBI Energy Transmission, Inc.
North Bakken Expansion Project – Class III Survey Reports 2020 Field Season
McKenzie, Williams, Burke, and Mountrail Counties, North Dakota
ND SHPO Ref.: 19-5593

Dear Mr. Wolf:

Please reference WBI Energy Transmission, Inc.'s (WBI Energy's) previous correspondence regarding the above referenced project. WBI Energy proposes to construct and operate the North Bakken Expansion Project (Project) in McKenzie, Williams, Burke, and Mountrail Counties, North Dakota.

The Project is regulated by the Federal Energy Regulatory Commission (FERC) under Section 7(c) of the Natural Gas Act. Under the Energy Policy Act of 2005, FERC is the lead agency for coordinating federal authorizations and complying with the National Environmental Policy Act on natural gas pipeline projects subject to its jurisdiction. FERC similarly is the lead federal agency for complying with Section 106 of the National Historic Preservation Act (NHPA) on natural gas pipeline projects under its jurisdiction. In accordance with 36 CFR 800.2(c)(4), WBI Energy is assisting the FERC in meeting its obligations under Section 106 of the NHPA by coordinating with agencies and tribes and conducting surveys to identify historic properties that may be affected by the Project.

Enclosed for your review please find Class III survey reports for the archaeological and historic structures surveys that were conducted during the 2019 and 2020 field seasons. The archaeological report includes the results provided in the original Class III report and addresses comments that were provided by the State Historical Society of North Dakota, Bureau of Land Management, U.S. Army Corps of Engineers, and the U.S. Forest Service. The attached table summarizes our response to those comments and provides the location of the relevant revisions or clarifications. A report on geomorphological investigations is also included in this submittal.

WBI Energy would appreciate your comments on the attached reports. If you have any questions or comments on the Project or the reports, please contact me at 612-840-8976 or pat.robblee@erm.com, or Dr. Kevin Malloy at 906-285-0361 or kevin.malloy@erm.com. Please direct written correspondence to Dr. Malloy's attention at:

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Comments from the State Historical Society of North Dakota		
General comments:		
o Provide more background information on sites with previous work. Focus on methods and reasoning for previous eligibility recommendation.	Additional information on previous investigations has been added to site descriptions, as applicable.	Sections 5.3 through 5.7
o Map symbology has item named "Shovel test – No Dig". Are these shovel probes that were planned, but not excavated for some reason? If so provide explanation.	These are planned but unexcavated shovel tests. Site descriptions have been updated, as applicable, to explain why some planned shovel tests were not excavated. Typical reasons for not excavating shovel tests include the presence of buried utilities (documented through One-Call markings) or slope.	Sections 5.3 through 5.5
Avoidance, 50 ft buffer minimum, fence, and monitor:		
o Private land: 32BK277, 32BK279, 32BK280, 32BK282, 32MZ3308, 32MZ3309, 32MZ3310, 32MZ3311, 32MZ3325, 32MZ3327, 32WI1494, 32WI1630, 32WI2144, 32WI2388, 32WI2389, 32WI2391, 32WI2392, 32WI2393, 32WI2394, 32WI2398, 32WI2406, 32WI2408.	Each of these sites is avoided with a minimum 50 ft buffer. Additionally, for sites located between 50 and 100 ft of Project workspace, WBI Energy commits to fencing and monitoring at these locations.	Section 5.3
o US Forest Service Sites: 32MZ3301, 32MZ3314, 32MZ3315, 32MZ3319, 32MZ3320, 32MZ3322, 32MZ3324.	Each of these sites is avoided with a minimum 50 ft buffer. Additionally, for sites located between 50 and 100 ft of Project workspace, WBI Energy commits to fencing and monitoring at these locations.	Section 5.5
Formally evaluate with site delineation and at least one 1x1 m TU. Submit evaluation plan prior to fieldwork:		
o Private Land: 32BK278, 32MZ3302, 32MZ3306, 32MZ3307, 32MZ3318, 32MZ3323, 32MZ3326, 32MZ3328, 32MZ3329, 32MZ3331, 32WI2390, 32WI2405, 32WI2407, 32WI2409, 32WI2410.	Additional testing (shovel testing and/or the excavation of at least one, 1 x 1 m test unit) was completed at each of these sites in accordance with a testing plan approved by the SHSND. Testing at sites 32WI2390 and 32MZ3328 was suspended following the identification of stone features at these sites; however, the pipeline route has been adjusted to avoid these sites with a minimum 50-ft buffer.	Section 5.3
o US Forest Service Site: 32MZ2346.	While ERM planned to conduct additional testing at this site, the pipeline route was modified prior to this work such that the site is now avoided by the Project with a buffer greater than 100 ft.	Section 5.5
Isolated finds:		
o Discuss subsurface potential on all IFs on a case-by-case basis. If the finds are in a good depositional context, STPs may be necessary to show that these are truly isolates. Minimal site recording may be enough to get a site number for database purposes, but more information is needed to verify that these are truly part of a category that can be written-off as not eligible.	Individual descriptions of isolated finds have been added to the text, including the results of shovel testing or an explanation for why shovel tests were not excavated.	Section 5.7

Site-by-site comments, private land:		
o 32BK168 – Expand reasoning for Not Eligible Determination both previously and now. Newly recorded site boundary included previously unidentified features. Perhaps site should be unevaluated. Consider formal evaluation and provide updated management recommendations.	ERM conducted site testing at 32BK168 in 2020. Evidence of intact cultural deposits and features was identified during testing and the site is now recommended as eligible for listing in the NRHP. The pipeline route has been modified to avoid this site with a buffer of 57 ft.	Section 5.3
o 32MZ3323 – Discussion mentions "Better Examples" of homesteads. Provide examples.	The description for 32MZ3323 has been updated to incorporate the results of additional testing (shovel testing and the excavation of a 1 x 1 m test unit) in the updated Class III report.	Section 5.3
o 32WI1495 – Actual well shown in Figure 5.3-81 may be visible in figure 5.3-80. Is this location impacted by project? Consider site lead.	The location of the well (which is no longer extant) is discussed in the updated Class III report in conjunction with 32WI1495. ERM has submitted a site lead form for this resource. The suggested boundary of the site lead is 19 ft from Project workspace. The actual location of the well is about 235 ft from Project workspace.	Section 5.3
o 32WI2404 – How is this identified as prehistoric? Could it be a result of natural glacial and/or historic or modern field clearing? Provide evidence. Fence and monitor as necessary.	The interpretation of the feature at 32WI2404 as prehistoric is conservative and based on best professional judgement. Tribal cultural specialists who visited the site with ERM concurred with this interpretation.	Section 5.3
o 32WI2408 – Workspace is extremely close to possible graves. Is the planned route fixed?	The pipeline route has been modified to avoid this site with a buffer of 213 ft.	Section 5.3
Site-by-site comments, US Army Corps of Engineers land:		
o 32MZ976 – Drilling under site is not avoidance as leaks and emergency repairs do consider cultural resources. Formal testing or horizontal avoidance is necessary.	The trajectory of the HDD will be 160 to 180 ft below ground surface where it passes beneath 32WI976. The pipeline will carry gas, not a liquid; the gas would migrate to the surface and dissipate into the air in the event of a leak. Given the depth of the HDD installation, daylighting of the pipeline for repair would not be feasible. If repair is required in the future, the most likely course of action would be to re-install a new segment via HDD, which would require federal authorizations, thereby triggering review of the action under Section 106 of the NHPA. A description of the HDD method has been added to the description of 32WI976 in Section 5.4 of the report. Additional testing at the site is pending and scheduled to be completed this fall. The results will be discussed in an addendum report.	Section 5.4
o 32MZ976 – Show bore location and HDD line on map	A figure showing the HDD alignment with entry and exit points has been added to the description of this site as has a construction alignment sheet. The alignment sheet depicts the HDD in plan and profile.	Section 5.4

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
o 32MZ976 – Clarify and provide more evidence for geomorphological hypothesis of A horizon being related to flood deposits. Typically, A horizons show stability rather than accretional or erosional events. Provide more information on why artifacts are interpreted as disturbed rather than in primary context.	The text in the updated Class III report has been updated to address this comment. As noted above, additional testing is planned to occur at 32WI976 this fall, which will provide additional information on the soils present at the site.	Section 5.4
o 32MZ976 – Did cut bank provide additional information on buried soils? Were artifacts identified in cut bank?	The cut bank was examined during the initial survey. As noted above, additional testing is planned to occur at the site this fall with results to be discussed in an addendum report.	Section 5.4
o 32WI976 – Given size and shape of site, additional TUs recommended.		
Comments from the Bureau of Land Management		
o The recommended protection/avoidance measures for unevaluated and eligible archaeological sites in the Class III report are inadequate, particularly regarding stone feature sites. The usual avoidance distance requested/required by the BLM is 100 feet. More than 100 feet is preferred for stone feature sites. Revise protection/avoidance measures buffers for archaeological sites.	WBI Energy has routed the pipeline to avoid unevaluated and eligible sites with a minimum buffer of 50 ft as directed by the SHSND.	Sections 5.3 through 5.5
o Why were indirect effects to archaeological sites not considered? Setting is an important aspect of integrity for stone feature sites. There are numerous archaeological sites within and near the survey corridor that should be analyzed for indirect effects. Revise the report to address indirect effects to archaeological sites.	The report has been updated to include an assessment of physical and non-physical impacts on unevaluated and eligible sites.	Sections 4 and 5.5 through 5.5
o WBI Energy needs to develop a cultural resource monitoring plan for construction.	WBI Energy commits to preparing a monitoring plan for construction.	Sections 5.3 through 5.5
o Update site form for all sites, site leads, and isolated finds regardless of whether they were relocated. Even if a cultural resource could not be relocated, that is still valuable information for the next project/site visit.	Site form updates have been submitted for all sites, isolated finds, and site leads discussed in the updated Class III report	N/A
o WBI Energy should make additional efforts to involve tribes in upcoming 2020 fieldwork and field reviews.	As discussed in more detail in Section 4 of the updated Class III report, WBI Energy retained Beaver Creek Archaeology to coordinate tribal participation in fieldwork in 2020. BCA worked with tribes to document sites as cultural heritage resources. The results of that work will be presented in a separate report. Information on tribal participation in the surveys also is provided in Sections 4 and 5.3 through 5.5 of ERM's updated Class III report	Sections 4 and 5.3 through 5.5

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
Comments from U.S. Army Corps of Engineers		
o In section 5.4.2, remove figures for 32MZ0598 and move to the previous section.	This comment is addressed in the updated Class III report	Section 5.4
o Figure 5.4-5: Map of Site 32WI976, provide contour lines on this map to show the slope. This information would help to explain why the shovel testing pattern appears the way it does.	Contour lines are provided on Figure 5.4-9 in the updated Class III report.	Section 5.4
o ERM, on behalf of WBI [Energy], identified a second concentration of artifacts in the western side of site 32WI0976 after they started excavating the test unit. Some additional testing is needed here as USACE cannot agree with the recommended determination for this site given the data presented in this report.	Additional testing will be completed at this site in the fall of 2020 with the results presented in an addendum report.	Section 5.4
o USACE recommends that WBI [Energy] conduct a remote sensing evaluation (gradiometer or conductivity) at site 32WI0976. This would be the best way to produce measurable data regarding the presence/absence of subsurface features at the site.	A remote sensing survey of the site was completed in the summer of 2020. The results of the survey were used to prepare a testing plan for 32WI976. Additional testing at the site will occur this fall with the results presented in an addendum report.	Section 5.4
Comments from the U.S. Forest Service		
o The map showing previously recorded cultural resources within a one-mile radius is only included in the overall Class III and not in the Forest Service stand-alone report. Please include this in the stand-alone Forest Service report.	This comment is no longer applicable. Survey results for USFS lands are included in the updated Class III inventory report in Section 5.5.	N/A
o Figure 1.1-2 shows the Forest Service surface and differentiates between the survey corridor and the survey corridor on Forest Service surface; however, the survey corridor on Forest Service surface and the actual Forest Service surface displayed don't match.	This comment is no longer applicable. Survey results for USFS lands are included in the updated Class III inventory report in Section 5.5.	N/A
o Sites 32MZ2347 (Historical Archaeological) and 32MZ3278 (Cairn) are located immediately adjacent to the survey corridor but are not discussed. Please discuss.	Based on route modifications, 32MZ3278 was visited in 2020 and the site boundary expanded based on the findings. A discussion of the site is provided in the updated Class III report. 32MZ2347 is outside the inventory corridor for the Project; however, we have included a discussion of this site in the Class III inventory report.	Section 5.5
o Site 32MZ145 site form update does not appear to have been performed. Why? Was an attempt made to actually relocate the site? Also, according to the site form, a THPO representative requested avoidance in 2013. More work on this site is probably needed.	When 32MZ145 was first recorded in 1979, it was characterized as two stone cairns. Subsequent investigations described the site as consisting of a single historic rock clearing pile on the west side of Highway 1806, noting that the second pile was likely destroyed by construction of the highway. ERM's survey in 2019 was limited to the east side of Highway 1806, which explains why we did not relocate the site at that time. In 2020, ERM conducted additional survey on USFS lands, examining a corridor on the west side of Highway 1806. 32MZ145 was relocated as a result of this work. The site is discussed in the updated Class III report. Tribal cultural specialists who accompanied ERM during the 2020 field investigation concurred that 32MZ145 is historic rock clearing pile.	Section 5.5

Comments on the Draft Class III Inventory Report		
Comments:	**Responses:**	**Location in Updated Report:**
o Site 32MZ2346 and 32MZ144: it is very improbable and therefore suspicious that there are zero artifacts and one artifact respectively at sites with historic dumps.	Sites 32MZ2346 and 32MZ144 are both previously recorded historic sites which ERM revisited and recorded during the survey for the Project. Cultural material was observed at both sites as described in the updated Class III report. ERM expanded the boundaries of 32MZ2346 to encompass two previously unreported features at the site. One artifact–a commemorative coin–was collected from 32MZ2346 because of its uniqueness. No artifacts were collected from 32MZ144. Expanded descriptions of both sites are provided in the updated Class III report.	Section 5.5
o Additional survey is shown as needed near site 32MZ3278 on the maps in the overall Class III report but not in the Forest Service stand-alone report. Please include this in the stand-alone Forest Service report.	Additional survey was completed in 2020 on USFS lands in the vicinity of 32MZ3278, which was relocated. A description of the site is provided in the updated Class III report.	Section 5.5
o The recommended avoidance and fencing measures are inadequate, especially for stone feature sites.	All stone feature sites have been avoided with a minimum buffet of 50 ft. Additionally, for sites between 50 and 100 ft of Project workspace WBI Energy commits to fencing and monitoring the sites during construction. WBI Energy will provide a monitoring plan for agency review.	Section 5.5
o A monitoring plan is needed.	WBI Energy commits to providing a construction monitoring plan as discussed in the updated Class III report.	
o Updates should have been conducted for all sites, site leads, and IFs [isolated finds] regardless of whether or not they were relocated.	Site form updates have been submitted for all applicable sites, isolated finds, and site leads discussed in the report	N/A
o The discussion of site leads during fieldwork is inadequate.	Site leads are discussed in Section 5.6 of the updated Class III report.	Section 5.6
o Provide specific distances between site boundaries and the edge of the workspace.	Distances between sites and Project workspaces have been added to summary tables and site descriptions throughout the updated Class III report.	Sections 5.3 through 5.5
o Provide a map of shovel testing performed outside of site boundaries. The report explains the testing strategy during survey but never discusses or shows specifics except within site boundaries.	The route maps provided as Appendix B depict survey methodology in addition to survey coverage and results.	Appendix B
o Identify the level of tribal involvement in the survey.	Tribal participation in field surveys is discussed in Sections 4 and 5.3 through 5.5 of the updated Class III report.	Sections 4 and 5.3 through 5.5
o Discuss whether indirect effects to archaeological sites were considered.	For unevaluated sites, we have added an assessment of non-physical impacts on setting.	Sections 5.3 through 5.5

Subject: FedEx Shipment 771552340704 Delivered

This tracking update has been requested by:

Company Name: ERM
Name: Sean Cullen
E-mail: sean.cullen@erm.com

Our records indicate that the following shipment has been delivered:

Reference: 0501732-06E-01
Ship date: Sep 17, 2020
Signed for by: J.ARCHAMBALT
Delivery location: HARLEM, MT
Delivered to: Receptionist/Front Desk
Delivery date: Fri, 9/18/2020 1:12 pm
Service type: FedEx Priority Overnight®
Packaging type: Your Packaging
Number of pieces: 1
Weight: 7.00 lb.
Special handling/Services Deliver Weekday
Standard transit: 9/18/2020 by 4:30 pm

Tracking number: 771552340704

Correspondence between Beaver Creek Archaeology and Tribal Historic Preservation Officers and/or Agencies Regarding Tribal Participation in Field Surveys

Correspondence Logs with Tribal Historic Preservation Officers

Communications with Standing Rock Sioux Tribe

Date	Summary
7/23/2020	
	At 12:25 pm CST, Raina emailed all project-specific applicable THPOs, cc'ing all state and federal agencies (excluding FERC). In the email, Raina attached the 6th weekly update for the project. Included in the email were some special notes regarding the planned end date for the project as well as providing updates with respect to the Hartel property and BCA20-1313-CHFMSite15.
7/31/2020	
	At 2:19 pm, Raina sent and email to all project-specific applicable THPOS, cc'ing Wade. The email included the weekly update for the week of July 20 through July 25. In addition was special notes and updates that included the extension of the project date. The fieldwork should now be complete August 7. She continued by saying that the Hartel parcel has been completed. She finished by alerting the THPOs to the fact that the site that ERM archaeologists and TCSs had disagreements regarding will continue to be recorded while submitting appropriate paperwork describing the TCSs disagreement. Raina closed out the email by saying that arrangements were being made to accommodate the extension of fieldwork and that if any TCSs needed swapped out for the new time frame to let BCA know.
	At 3:15 pm CST, Raina emailed all project-specific applicable THPOs, cc'ing Wade. She explained that she just received the most updated version of the survey schedule by ERM. Raina told the THPOs that she will keep them up to date to all changes as soon as she learned of them, noting that TCSs may know of changes sooner directly from ERM field crew.
8/7/2020	
	At 10:24 am CST, Raina sent an email to all project-specific applicable THPOs. The email contained the weekly update for July 27 through August 1. In the email she updating the THPOs to the extended completion date being August 14. This is because of a large stone feature that was discovered. TCS and ERM archaeologists continue to disagree over the validity of a site as well. Raina closed out the email by saying that BCA will be keeping THPOs and TCSs updated as much as possible.
8/10/2020	
	At 9:35 am CST, Raina sent an email to all project-specific applicable THPOs. The email came as a confirmation that fieldwork should be completed sometime this week. She said that TCSs will be released as soon as fieldwork is completed.

8/11/2020	
	At 11:44 am CST, Raina emailed all project-specific applicable THPOs. The email contained the ninth weekly update (August 3 through August 8). Raina added that fieldwork will be completed on the tenth week and that BCA and participating TCSs will be returning to the Hartel property to survey a reroute. She closed the email out by explaining that the TCSs sentiments regarding the stone features in the site revisits had been outlined in the attached update.
	At 6:29 pm CST, Raina emailed all project-specific applicable THPOs. In the email she outlined that she had received confirmation of the reroute touch-up survey. She explained that the survey will most-likely occur on Thursday of that week and will cover less than five acres of primarily plowed agricultural field. Raina closed by saying that they are on track to release the TCSs on Friday or Saturday of that week.
8/14/2020	
	At 3:11 pm CST, Raina emailed all project-specific applicable THPOs with the final weekly update for the second mobilization of the project. The attached document covered August 10 through August 13. She included in the email that fieldwork has ceased pending fields being harvested and that the Hartel reroute touch-up survey came up as no cultural material. Lastly she concluded that there had been two more sites discovered that were disagreed upon by TCSs and ERM archaeologists. She said that the same protocols will be followed for these new sites as the first site that was disagreed upon.
8/31/2020	
	At 3:01 pm CST, Raina emailed all project-specific applicable THPOs letting them know that BCA has been mapping and documenting the sites and features recorded by TCSs. BCA will be getting shapefiles data over to WBI and ERM that week for review and avoidance planning. Raina explained that ERM and WBI will plan to avoid site boundaries for stone feature sites on private and/or state surface by a 50' minimum as well as fencing off the project's ROW corridor. She continued by saying that BCA is working on completing the North Dakota Heritage Forms for SHPO though the information provided in those forms will have no affect archaeologically but will reflect the feature/site details provided by TCSs that has been approved to be documented and shared. Raina concluded by saying that during a call with ERM and WBI the previous Friday that ERM plans on resuming the remaining fieldwork starting September 9th and that it should take approximately 4 weeks. She requested that any THPO that can send TCS for the second mobilization of fieldwork let her know as soon as possible.

9/2/2020	
	At 10:29 am CST, Jon Eagle emailed all project-specific applicable THPOs and BCA staff. He expressed his concern regarding the disagreements between ERM archaeologists and TCSs. He requested site visits and contact information for the lead federal agency of the project.
	At 10:41 am CST, Raina emailed Jon Eagle and all project-specific applicable THPOs. In the email, she lists the contact information for FERC's Dawn Ramsey.
	At 10:55 am CST, Jeremy emailed Raina, cc'ing Hoksila White Mountain and Jon Eagle. He said that SRST had a TCS available and gave her Hoksila's contact information.
	At 11:08 am CST, Raina emailed Jeremy, cc'ing Hoksila and Jon. She explained that there will be a hotel room for Hoksila in Williston and that onboarding can be completed the evening that he arrives or the following morning.
	At 11:08 am CST, Jon Eagle emailed applicable BCA staff and all project-specific applicable THPOs. He followed up on his earlier request for site visits.
	At 11:18 am CST, Raina emailed all project-specific applicable THPOs. She explained that BCA has no issues with Jon's request but state and federal agencies would have to speak to the request. Raina said that she had forwarded the request on to the appropriate individuals at ERM and WBI. She let them know that she will let them know when she gets a response.
	At 11:43 am CST, Jon emailed all project-specific applicable THPOs and applicable BCA staff. He asked who the delegated federal authority would be.
	At 11:55 am CST, Raina emailed all project-specific applicable THPOs. She answered Jon's question by saying that WBI would be that authority.
	At 11:55 am CST, Jon emailed all project-specific applicable THPOs and applicable BCA staff. He asked who would be the contact he can consult within WBI.
	At 2:40 pm CST, Raina emailed all project-specific applicable THPOs, cc'ing Jill and Pat. In her email she listed the contacts for WBI and ERM (Jill Linn and Pat Robblee, respectively). She also explained who would be best to address certain questions.
	At 2:40 pm CST, Jon emailed all project-specific applicable THPOs, cc'ing Jill Linn of WBI, Pat Robblee of ERM and applicable BCA Staff. Jon thanked Raina for the information and said he had reached out to Dawn Ramsey of FERC who said she will contact WBI and ERM. Jon says he is waiting to hear from WBI.
9/3/2020	
	At 5:51 pm CST, Raina emailed all project-specific applicable THPOs. The email was a reminder of the second mobilization starting the following week. She provided the current travel date and asked that any THPOs that can send a TCS let her know. She also mentioned the two documents that she had attached that listed the known and new CHF interpretations for their review.

9/4/2020	
	At 8:02 am CST, Raina emailed all project-specific applicable THPOs that the start date for the second mobilization had been moved back to September 11 and that the travel day will be September 10th.
	At 8:03 am CST, Raina emailed Jeremy, cc'ing Jon and Hoksila. The email contained an update that the start date for the second mobilization had been moved back to September 11 and that the travel day will be September 10.
	At 1:25 pm CST, Raina emailed all project-specific applicable THPOs and applicable BCA staff. The email was a reminder of dates and that THPOs should let BCA know if they plan on sending a TCS for the mobilization.
	At 1:26 pm CST, Raina emailed Jeremy, cc'ing Hoksila and Jon. The email was a reminder of dates and that THPOs should let BCA know if they plan on sending a TCS for the mobilization.
	At 3:29 pm CST, Raina emailed all project-specific applicable THPOs, cc'ing applicable BCA staff. She attached a pdf of the combined known and new CHF sites. She tells them to let her know if they have any questions or concerns about the mobilization.
9/8/2020	
	At 9:32 am CST, Raina emailed all project-specific applicable THPOs. She provided them an update to the fieldwork scheduling from ERM. She also let them know that all THPOs that have confirmed a TCS will be getting a phone call.
	At 9:34 am CST, Raina emailed Jeremy, Hoksila and Jon. She provided them an update to the fieldwork scheduling from ERM. She also let them know that all THPOs that have confirmed a TCS will be getting a phone call.
	At 1:47 pm CST, Raina emailed Jeremy, Hoksila and Jon. She provided them the address for the hotel the TCSs will be staying at in Williston.
9/9/2020	
	At 8:50 am CST, Jon emailed Jill Linn, Raina, and all project-specific applicable THPOs, CC'ing BCA staff, Pat Robblee and Andrea Thornton of ERM. He thanked Jill for her response and suggested site visits with the archaeologists.
	At 9:40 am CST, Raina attempted to call Hoksila White Mountain's cell phone. There was no answer so Raina left a voicemail. She alerted him to ERM's change of field schedule.
	At 9:42 am CST, Raina called Jeremy Freeman's cell phone. She alerted him to the email she sent and to let him know that she had tried to get a hold of TCS Hoksila White Mountain. She also went over the new hire paperwork information.
	At 11:45 am CST, Hoksila called the BCA office to talk to Raina. He let Raina know that he will be in Williston that Thursday per the updated ERM schedule. Raina gave Hoksila the details for the hotel accommodations. She took down the town that he will be leaving from for the mileage check.
	At 3:50 pm CST, Raina emailed all project-specific applicable THPOs, cc'ing applicable BCA staff, Pat Robblee, Andrea Thornton, and Kevin Malloy. In her email she explains that efforts were being made to look at the site specified by Ft. Peck on September 11. She said that if anyone wanted to participate to let Raina know. She also said that more details on the meeting will come later. Raina addressed the inquiries regarding CHFM 5 and that after some digging, the feature will stay recorded and that the PDF will be updated.
	At 3:55 pm CST, Jon Eagle emailed Jill Linn, Raina, and all project-specific applicable THPOs, cc'ing applicable BCA staff, Kevin Malloy, Pat Robblee and Andrea Thornton of ERM. Jon said that he will be attending the site visit and requested to have logistics to the meeting passed along.

9/9/2020	
	At 4:45 pm CST, Jill emailed Raina and all project-specific applicable THPOs, cc'ing applicable BCA staff, Pat , Andrea and Kevin. She let everyone know that logistics were being finalized and they will be informed of them as soon as possible.
	At 5:00 pm CST, Raina emailed all project-specific applicable THPOs, and Jill, cc'ing applicable BCA staff, Pat, Andrea and Kevin. She shared the meeting date, time and location with everyone
9/10/2020	
	At 10:30 am CST, Raina emailed Jill and all project-specific applicable THPOs, cc'ing applicable BCA staff, Pat, Andrea and Kevin. The email was a reminder of the site visit the next day. Included in the the email was a list of the currently confirmed attendants and the meeting time, date and location of the meeting.
	At 10:34 am CST, Raina emailed Jill and all project-specific applicable THPOs, cc'ing applicable BCA staff, Pat, Andrea and Kevin. The email was a reminder of the site visit the next day. Included in the the email was an additional participant that wasn't listed in the previous email.
	At 11:44 am CST, Jon emailed Raina, Jill and all project-specific applicable THPOs, cc'ing applicable BCA staff, Pat, Andrea and Kevin. Jon stated that he will not be able to participate in the site visit.
	At 11:55 am CST, Raina responded to Jon via email and included all project-specific applicable THPOs, cc'ing applicable BCA staff, Pat, Andrea and Kevin. She thanked Jon for letting her know he won't be able to attend and let him know that she will keep him updated.
	At 4:18 pm CST, Jon emails Raina, Jill, all project-specific-applicable THPOs, cc'ing applicable BCA staff, Pat, Andrea and Kevin. He said that he is in contact with WBI for a future site visit.
	At 4:33 pm CST, Raina emails Jon, Jill, all project-specific-applicable THPOs, cc'ing applicable BCA staff, Pat, Andrea and Kevin. She made sure that he knew that any of the sites found on public land (USFS and BLM) are open to visits whenever.
9/14/2020	
	At 11:10 am CST, Raina emailed all project-specific applicable THPOS. She gave an update on the first week of the second mobilization for the project as well as the site visit form September 11.
	At 11:47 am CST, Raina emailed all project-specific applicable THPOs. She resent the first weekly update for the second mobilization.
9/15/2020	
	At 12:16 pm CST, Raina emailed all project-specific applicable THPOs with a confirmation email of a second site visit as well as meeting details.
9/16/2020	
	At 11:39 am CST, Raina emailed Jeremy and Jon. She was touching base with them to see if Jon was planning on heading to Watford City, North Dakota that night or the next day so she could possibly set up a hotel room for him.
	At 11:59 am CST, Jon emailed Raina and Jeremy letting them know that he will be traveling to Watford City that night and that he had already made plans for accommodations.

9/14/2020	
	At ~11 am CST, Eric called Hoksila regarding whether he will be participating as an independent contractor or as an employee of BCA. Eric explained the details of both options. The explanation of the independent contractor option came from an email that Jill Linn of WBI sent to Raina Hanley regarding the matter. Hoksila opted to work as a BCA employee.
	At 11:47 am CST, Raina emailed all project-specific applicable THPOs. She resent the first weekly update for the second mobilization.
9/18/2020	
	At 9:48 am CST, Raina emailed all project- specific applicable THPOs. She provided an update regarding the site visit the day before.

Communications with the Sisseton - Wahpeton Oyate

Date	Summary
7/23/2020	
	At 12:25 pm CST, Raina emailed all project-specific applicable THPOs, cc'ing all state and federal agencies (excluding FERC). In the email, Raina attached the 6th weekly update for the project. Raina told the THPOs that she will keep them up to date to all changes as soon as she learned of them, noting that TCSs may know of changes sooner directly from ERM field crew.
8/7/2020	
	At 10:24 am CST, Raina sent an email to all project-specific applicable THPOs. The email contained the weekly update for July 27 through August 1. In the email she updating the THPOs to the extended completion date being August 14. This is because of a large stone feature that was discovered. TCS and ERM archaeologists continue to disagree over the validity of a site as well. Raina closed out the email by saying that BCA will be keeping THPOs and TCSs updated as much as possible.
8/10/2020	
	At 9:35 am CST, Raina sent an email to all project-specific applicable THPOs. The email came as a confirmation that fieldwork should be completed sometime this week. She said that TCSs will be released as soon as fieldwork is completed.

8/11/2020	
	At 11:44 am CST, Raina emailed all project-specific applicable THPOs. The email contained the weekly update for week 9 (August 3 through August 8). Raina added that fieldwork will be completed on the tenth week and that BCA and participating TCSs will be returning to the Hartel property to survey a reroute. She closed the email out by explaining that the TCSs sentiments regarding the stone features in the site revisits had been outlined in the attached update.
	At 6:29 pm CST, Raina emailed all project-specific applicable THPOs. In the email she outlined that she had received confirmation of the reroute touch-up survey. She explained that the survey will most-likely occur on Thursday of that week and will cover less than 5 acres of primarily plowed agricultural field. Raina closed by saying that they are on track to release the TCSs on Friday or Saturday of that week.
8/14/2020	
	At 3:11 pm CST, Raina emailed all project-specific applicable THPOs with the final weekly update for the project. The attached document covered August 10 through August 13. She included in the email that fieldwork has ceased pending fields being harvested and that the Hartel reroute touch-up survey came up as no cultural material. Lastly she concluded that there had been two more sites discovered that were disagreed upon by TCSs and ERM archaeologists. She said that the same protocols will be followed for these new sites as the first site that was disagreed upon.
8/31/2020	
	At 3:01 pm CST, Raina emailed all project-specific applicable THPOs letting them know that BCA has been mapping and documenting the sites and features recorded by TCSs. BCA will be getting shapefiles data over to WBI and ERM that week for review and avoidance planning. Raina explained that ERM and WBI will plan to avoid site boundaries for stone feature sites on private and/or state surface by a 50' minimum as well as fencing off the project's ROW corridor. She continued by saying that BCA is working on completing the North Dakota Heritage Forms for SHPO though the information provided in those forms will have no affect archaeologically but will reflect the feature/site details provided by TCSs that has been approved to be documented and shared. Raina concluded by saying that during a call with ERM and WBI the previous Friday that ERM plans on resuming the remaining fieldwork starting September 9th and that it should take approximately 4 weeks. She requested that any THPO that can send TCss for the second mobilization of fieldwork let her know as soon as possible.

9/2/2020	
	At 10:41 am CST, Raina emailed all project-specific applicable THPOS. In the email she lists the contact information for FERC's Dawn Ramsey.
	At 11:00 am CST, Dianne emailed all project-specific applicable THPOS and BCA staff. She stated that SWO supports Jon Eagle of SRST's request for site visits.
	At 11:22 am CST, Raina emailed all project-specific applicable THPOs, CC'ing BCA staff. She said that Dianne's response has been noted and forwarded to the appropriate individuals at ERM and WBI.
	At 11:18 am CST, Raina emailed all project-specific applicable THPOs. She explained that BCA has no issues with Jon's request but state and federal agencies would have to speak to the request. Raina said that she had forwarded the request on to the appropriate individuals at ERM and WBI. She let them know that she will let them know when she gets a response.
	At 11:55 am CST, Raina emailed all project-specific applicable THPOs. She answered Jon's question by saying that WBI would be that authority.
	At 2:40 pm CST, Raina emailed all project-specific applicable THPOs. In her email she listed the contacts for WBI and ERM (Jill Linn and Pat Robblee, respectively). She also explained who would be best to address certain questions.
9/3/2020	
	At 4:03 pm CST, Jill Linn emailed all project-specific applicable THPOs, Raina and CC'd Pat Robblee and Andrea Thornton of ERM. She addressed Jon saying that she left a voice mail at his office. She then goes on to address his concerns by explaining that WBI contracted ERM for the archaeological work therefore all discussions of sites and the reasons for recording should be addressed by ERM. She says that Pat Robblee had been copied on the email thread so that he can address the concerns as well. She addresses the site visits by saying that WBI, ERM and BCA will be working together to talk to landowners and land management for access to the sites.
	At 5:51 pm CST, Raina emailed all project-specific applicable THPOs. The email was a reminder of the second mobilization starting the following week. She provided the current travel date and asked that any THPOs that can send a TCS let her know. She also mentioned the two documents that she had attached that listed the known and new CHF interpretations for their review.
9/4/2020	
	At 8:02 am CST, Raina emailed all project-specific applicable THPOs that the start date for the second mobilization had been moved back to September 11 and that the travel day will be September 10th.
	At 1:25 pm CST, Raina emailed all project-specific applicable THPOs and applicable BCA staff. The email was a reminder of dates and that THPOs should let BCA know if they plan on sending a TCS for the mobilization.
	At 3:29 pm CST, Raina emailed all project-specific applicable THPOs, cc'ing applicable BCA staff. She attached a PDF of the combined known and new CHF sites. She tells them to let her know if they have any questions or concerns about the mobilization.
9/8/2020	
	At 9:32 am CST, Raina emailed all project-specific applicable THPOs. She provided them an update to the fieldwork scheduling from ERM. She also let them know that all THPOs that have confirmed a TCS will be getting a phone call.

9/9/2020	
	At 3:50 pm CST, Raina emailed all project-specific applicable THPOs, cc'ing applicable BCA staff, Pat Robblee, Andrea Thornton, and Kevin Malloy. In her email, she explains that efforts were being made to look at the site specified by Ft. Peck on September 11. She said that if anyone wanted to participate to let Raina know. She also said that more details on the meeting will come later. Raina addressed the inquiries regarding CHFM 5 and that after some digging, the feature will stay recorded and that the PDF will be updated.
9/10/2020	
	At 10:30 am CST, Raina emailed Jill and all project-specific applicable THPOs, cc'ing applicable BCA staff, Pat, Andrea and Kevin. The email was a reminder of the site visit the next day. Included in the the email was a list of the currently confirmed attendants and the meeting time, date and location of the meeting.
	At 10:34 am CST, Raina emailed Jill and all project-specific applicable THPOs, cc'ing applicable BCA staff, Pat, Andrea and Kevin. The email was a reminder of the site visit the next day. Included in the the email was an additional participant that wasn't listed in the previous email.
	At 10:54 am CST, Dianne emailed Raina, Jill, all project-specific applicable THPOs, cc'ing applicable BCA staff, Pat, Andrea, and Kevin. She stated that SWO will not be able to attend the site visit but requests to be kept up to date on the results.
	At 10:57 am CST, Raina emailed Jill, all project-specific applicable THPOs, cc'ing applicable BCA staff, Pat, Andrea, and Kevin. She stated that BCA will keep everyone up to date.
9/14/2020	
	At 11:10 am CST, Raina emailed all project-specific applicable THPOS. She gave an update on the first week of the second mobilization for the project as well as the site visit form September 11.
	At 11:47 am CST, Raina emailed all project-specific applicable THPOs. She resent the first weekly update for the second mobilization.
9/18/2020	
	At 9:48 am CST, Raina emailed all project- specific applicable THPOs. She provided an update regarding the site visit the day before.

Communications with Turtle Mountain Band of Chippewa

Date	Summary
7/22/2020	
	At 8:45 pm CST, Raina emailed Jeff alerting him to an issue that a BCA representative alerted her to regarding a TCS. Raina said that they will need to discuss it tomorrow (July 23).
7/23/2020	
	At 10:52 am CST, Raina attempted to call Jeff's office. A woman answered and said that Jeff was in a meeting. Raina left a message to have Jeff call her. The call lasted until 10:53 am CST.
	At 10:58 am CST, Raina emailed Jeff saying that she attempted to call his office number. She said that she lefts a massage with the girl that answered the phone and told him to give her a call at the office or her cell phone.
	At 11:29 am CST, Jeff called the BCA office and asked for Raina. During their conversation, Raina filled Jeff in to the incident involving TCS Mike McCloud as well as updating him to what has happened since it occurred. Raina also followed up with Jeff on the site he was interested. Raina had talked to ERM to contact the landowner to gain access to the site but the landowner denied access. She also explained the rumors of ERM demobilizing from the field which is that ERM is only partially demobilizing and that the TCSs should expect to be there next week for 2019 site review. Raina told Jeff that she will keep him up to date.
	At 12:25 pm CST, Raina emailed all project-specific applicable THPOs, cc'ing all state and federal agencies (excluding FERC). In the email, Raina attached the 6th weekly update for the project. Included in the email were some special notes regarding the planned end date for the project as well as providing updates with respect to the Hartel property and BCA20-1313-CHFMSite15.
7/31/2020	
	At 2:19 pm CST, Raina sent and email to all project-specific applicable THPOS, cc'ing Wade. The email included the weekly update for the week of July 20 through July 25. In addition was special notes and updates that included the extension of the project date. The fieldwork should now be complete August 7. She continued by saying that the Hartel parcel has been completed. She finished by alerting the THPOs to the fact that the site that ERM archaeologists and TCSs had disagreements regarding will continue to be recorded while submitting appropriate paperwork describing the TCSs disagreement. Raina closed out the email by saying that arrangements were being made to accommodate the extension of fieldwork and that if any TCSs needed swapped out for the new time frame to let BCA know.
	At 3:15 pm CST, Raina emailed all project-specific applicable THPOs, cc'ing Wade. She explained that she just received the most updated version of the survey schedule by ERM. Raina told the THPOs that she will keep them up to date to all changes as soon as she learned of them, noting that TCSs may know of changes sooner directly from ERM field crew.
8/7/2020	
	At 10:24 am CST, Raina sent an email to all project-specific applicable THPOs. The email contained the weekly update for July 27 through August 1. In the email, she updated the THPOs to the extended completion date being August 14. This is because of a large stone feature that was discovered. TCS and ERM archaeologists continue to disagree over the validity of a site as well. Raina closed out the email by saying that BCA will be keeping THPOs and TCSs updated as much as possible.
8/10/2020	
	At 9:35 am CST, Raina sent an email to all project-specific applicable THPOs. The email came as a confirmation that fieldwork should be completed sometime this week. She said that TCSs will be released as soon as fieldwork is completed.

8/11/2020	
	At 11:44 am CST, Raina emailed all project-specific applicable THPOs. The email contained the ninth weekly update (August 3 through August 8). Raina added that fieldwork will be completed on the tenth week and that BCA and participating TCSs will be returning to the Hartel property to survey a reroute. She closed the email out by explaining that the TCSs sentiments regarding the stone features in the site revisits had been outlined in the attached update.
	At 6:29 pm CST, Raina emailed all project-specific applicable THPOs. In the email she outlined that she had received confirmation of the reroute touch-up survey. She explained that the survey will most-likely occur on Thursday of that week and will cover less than 5 acres of primarily plowed agricultural field. Raina closed by saying that they are on track to release the TCSs on Friday or Saturday of that week.
8/14/2020	
	At 3:11 pm CST, Raina emailed all project-specific applicable THPOs with the final weekly update for the project. The attached document covered August 10 through August 13. She included in the email that fieldwork has ceased pending fields being harvested and that the Hartel reroute touch-up survey came up as no cultural material. Lastly she concluded that there had been two more sites discovered that were disagreed upon by TCSs and ERM archaeologists. She said that the same protocols will be followed for these new sites as the first site that was disagreed upon.
8/31/2020	
	At 3:01 pm CST, Raina emailed all project-specific applicable THPOs letting them know that BCA has been mapping and documenting the sites and features recorded by TCSs. BCA will be getting shapefiles data over to WBI and ERM that week for review and avoidance planning. Raina explained that ERM and WBI will plan to avoid site boundaries for stone feature sites on private and/or state surface by a 50' minimum as well as fencing off the project's ROW corridor. She continued by saying that BCA is working on completing the North Dakota Heritage Forms for SHPO though the information provided in those forms will have no affect archaeologically but will reflect the feature/site details provided by TCSs that has been approved to be documented and shared. Raina concluded by saying that during a call with ERM and WBI the previous Friday that ERM plans on resuming the remaining fieldwork starting September 9th and that it should take approximately 4 weeks. She requested that any THPO that can send TCSs for the second mobilization of fieldwork let her know as soon as possible.
9/2/2020	
	At 10:41 am CST, Raina emailed Jon Eagle and all project-specific applicable THPOS. In the email, she lists the contact information for FERC's Dawn Ramsey.
	At 11:18 am CST, Raina emailed all project-specific applicable THPOs. She explained that BCA has no issues with Jon's request but state and federal agencies would have to speak to the request. Raina said that she had forwarded the request on to the appropriate individuals at ERM and WBI. She let them know that she will let them know when she gets a response.
	At 11:55 am CST, Raina emailed all project-specific applicable THPOs. She answered Jon's question by saying that WBI would be that authority.
	At 2:40 pm CST, Raina emailed all project-specific applicable THPOs. In her email, she listed the contacts for WBI and ERM (Jill Linn and Pat Robblee, respectively). She also explained who would be best to address certain questions.
9/3/2020	
	At 5:51 pm CST, Raina emailed all project-specific applicable THPOs. The email was a reminder of the second mobilization starting the following week. She provided the current travel date and asked that any THPOs that can send a TCS let her know. She also mentioned the two documents that she had attached that listed the known and new CHF interpretations for their review.

9/4/2020	
	At 8:02 am CST, Raina emailed all project-specific applicable THPOs that the start date for the second mobilization had been moved back to September 11 and that the travel day will be September 10th.
	At 1:25 pm CST, Raina emailed all project-specific applicable THPOs and applicable BCA staff. The email was a reminder of dates and that THPOs should let BCA know if they plan on sending a TCS for the mobilization.
	At 3:29 pm CST, Raina emailed all project-specific applicable THPOs, cc'ing applicable BCA staff. She attached a PDF of the combined known and new CHF sites. She tells them to let her know if they have any questions or concerns about the second mobilization.
9/8/2020	
	At 9:32 am CST, Raina emailed all project-specific applicable THPOs. She provided them an update to the fieldwork scheduling from ERM. She also let them know that all THPOs that have confirmed a TCS will be getting a phone call.
9/9/2020	
	At 3:30 pm CST, Eric Lillestrand called Jeffery Desjarlais, Jr. at his office. He asked if TMBC will be sending a TCS for the second mobilization for the project. Jeff said that they would. Eric asked if the TCS would be Michael McCloud again. Jeff said no, that he will be sending Ron Keplin. Eric let Jeff know that he will be sending an email with more information regarding the second mobilization.
	At 3:43 pm CST, Eric emailed Jeff. The email was to confirm that Ron Kepline will be the TCS representing TMBC. The email contained the hotel details and new hire paperwork and the new hire paperwork.
	At 3:50 pm CST, Raina emailed all project-specific applicable THPOs, cc'ing applicable BCA staff, Pat Robblee, Andrea Thornton, and Kevin Malloy. In her email, she explains that efforts were being made to look at the site specified by Ft. Peck on September 11. She said that if anyone wanted to participate to let Raina know. She also said that more details on the meeting will come later. Raina addressed the inquiries regarding CHFM 5 and that after some digging, the feature will stay recorded and that the PDF will be updated.
9/10/2020	
	At 10:30 am CST, Raina emailed Jill and all project-specific applicable THPOs, cc'ing applicable BCA staff, Pat, Andrea and Kevin. The email was a reminder of the site visit the next day. Included in the the email was a list of the currently confirmed attendants and the meeting time, date and location of the meeting.
	At 10:34 am CST, Raina emailed Jill and all project-specific applicable THPOs, cc'ing applicable BCA staff, Pat, Andrea and Kevin. The email was a reminder of the site visit the next day. Included in the the email was an additional participant that wasn't listed in the previous email.
	At 1:05 pm CST, Ron Keplin called the BCA office to talk to Eric Lillestrand. He asked for more project related information. Eric gave him hotel information, BCA's Aaron Kidwell's contact information and what time to meet in the mornings for fieldwork. Eric asked if Ron had received the email he sent to Jeff Desjarlais, Jr. to which Ron confirmed he did.
9/14/2020	
	At 11:10 am CST, Raina emailed all project-specific applicable THPOS. She gave an update on the first week of the second mobilization for the project as well as the site visit form September 11.
	At 11:47 am CST, Raina emailed all project-specific applicable THPOs. She resent the first weekly update for the second mobilization.
9/15/2020	
	At 9:10 am CST, Raina emailed Jeff. She reached out to let him know of a personal health concern of TCS Ron Keplin's. She asked Jeff if there was a different TCS he would be able to send.

9/18/2020	
	At 9:48 am CST, Raina emailed all project- specific applicable THPOs. She provided an update regarding the site visit the day before.

	At 4:45 pm CST, Jill Linn, emailed all project-specific applicable THPOs and Raina, cc'ing BCA staff, ERM and WBI.
9/10/2020	
	At 10:30 am CST, Raina emailed Jill and all project-specific applicable THPOs, cc'ing applicable BCA staff, Pat, Andrea and Kevin. The email was a reminder of the site visit the next day. Included in the the email was a list of the currently confirmed attendants and the meeting time, date and location of the meeting.
	At 10:34 am CST, Raina emailed Jill and all project-specific applicable THPOs, cc'ing applicable BCA staff, Pat, Andrea and Kevin. The email was a reminder of the site visit the next day. Included in the the email was an additional participant that wasn't listed in the previous email.
	At 12:36 pm CST, Pete Coffey explained that a death in the family will prevent him from participating in the site visit.
	At 1:04 pm CST, Raina emailed Pete Coffey. She gave her condolences and said that BCA will keep him updated.
	At 4:39 pm CST, Raina emailed Pete letting him know that it looked like Jon Eagle was trying to set up a site visit on 9/17.
	At 5:36 pm CST, Pete emailed Raina. He suggested postponing site visits out at least a week as he will be unavailable toward the end of September.
	At 5:58 pm CST, Raina explained several reasons why the site visit would still happen on September 11. She assures him that everyone will be kept up to date with anything that happens at the sites.
9/11/2020	
	At 7:36 am CST, Raina emailed all project-specific applicable THPOs, cc'ing applicable BCA staff, Pat, Andrea and Kevin. She lets everyone know that another site visit is being planned for next week. She explains why they are going forward with the site visit without SRST.
9/14/2020	
	At 11:10 am CST, Raina emailed all project-specific applicable THPOS. She gave an update on the first week of the second mobilization for the project as well as the site visit form September 11.
	At 11:47 am CST, Raina emailed all project-specific applicable THPOs and re-sent the first weekly update for the second mobilization.
9/16/2020	
	At ~3:30 pm CST, Raina Hanley called Pete Coffey to see if he is planning to attend the site visit on September 17. Pete said he will not be able to attend but would like an update following the visit. Raina said that she will provide a similar type of update as from the last visit and suggested that he reach out to SRST, RST and Ft. Peck for any specific details. Raina explained the disagreement between TCSs and ERM archaeologists to which Pete suggested an arbitrator, like SHPO, might be needed.
9/18/2020	
	At 9:48 am CST, Raina emailed all project- specific applicable THPOs. She provided an update regarding the site visit the day before.

Communications with Spirit Lake Tribe of Fort Totten

	At 2:40 pm CST, Raina emailed all project-specific applicable THPOs. In her email she listed the contacts for WBI and ERM (Jill Linn and Pat Robblee, respectively). She also explained who would be best to address certain questions.

9/3/2020	
	At 4:03 pm CST, Jill Linn emailed all project-specific applicable THPOs, Raina and cc'd Pat Robblee and Andrea Thornton of ERM. She addressed Jon saying that she left a voice mail at his office. She then goes on to address his concerns by explaining that WBI contracted ERM for the archaeological work therefore all discussions of sites and the reasons for recording should be addressed by ERM. She says that Pat Robblee had been copied on the email thread so that he can address the concerns as well. She addresses the site visits by saying that WBI, ERM and BCA will be working together to talk to landowners and land management for access to the sites.
	At 5:51 pm CST, Raina emailed all project-specific applicable THPOs. The email was a reminder of the second mobilization starting the following week. She provided the current travel date and asked that any THPOs that can send a TCS let her know. She also mentioned the two documents that she had attached that listed the known and new CHF interpretations for their review.
9/4/2020	
	At 8:02 am CST, Raina emailed all project-specific applicable THPOs that the start date for the second mobilization had been moved back to September 11 and that the travel day will be September 10th.
	At 1:25 pm CST, Raina emailed all project-specific applicable THPOs and BCA staff. The email was a reminder of dates and that THPOs should let BCA know if they plan on sending a TCS for the mobilization.
	At 3:29 pm CST, Raina emailed all project-specific applicable THPOs, cc'ing BCA staff. She attached a pdf of the combined known and new CHF sites. She tells them to let her know if they have any questions or concerns about the mobilization.
9/8/2020	
	At 9:32 am CST, Raina emailed app project-specific applicable THPOs. She provided them an update to the fieldwork scheduling from ERM. She also let them know that all THPOs that have confirmed a TCS will be getting a phone call.
9/9/2020	
	At 3:50 pm CST, Raina emailed all project-specific applicable THPOs, cc'ing BCA staff, Pat Robblee, Andrea Thornton, and Kevin Malloy. In her email she explains that efforts were being made to look at the site specified by Ft. Peck on September 11. She said that if anyone wanted to participate to let Raina know. She also said that more details on the meeting will come later. Raina addressed the inquiries regarding CHFM 5 and that after some digging, the feature will stay recorded and that the PDF will be updated.
9/10/2020	
	At 10:30 am CST, Raina emailed Jill and all project-specific applicable THPOs, cc'ing applicable BCA staff, Pat, Andrea and Kevin. The email was a reminder of the site visit the next day. Included in the the email was a list of the currently confirmed attendants and the meeting time, date and location of the meeting.
	At 10:34 am CST, Raina emailed Jill and all project-specific applicable THPOs, cc'ing applicable BCA staff, Pat, Andrea and Kevin. The email was a reminder of the site visit the next day. Included in the the email was an additional participant that wasn't listed in the previous email.
9/14/2020	
	At 11:10 am CST, Raina emailed all project-specific applicable THPOS. She gave an update on the first week of the second mobilization for the project as well as the site visit form September 11.
	At 11:47 am CST, Raina emailed all project-specific applicable THPOs. She resent the first weekly update for the second mobilization.
9/18/2020	
	At 9:48 am CST, Raina emailed all project- specific applicable THPOs. She provided an update regarding the site visit the day before.

Communications with the Yankton Sioux Tribe

Date	Summary
7/23/2020	
	At 12:25 pm CST, Raina emailed all project-specific applicable THPOs, cc'ing all state and federal agencies (excluding FERC). In the email, Raina attached the sixth weekly update for the project. Included in the email were some special notes regarding the planned end date for the project as well as providing updates with respect to the Hartel property and BCA20-1313-CHFMSite15.
7/31/2020	
	At 2:19 pm, Raina sent and email to all project-specific applicable THPOS, cc'ing Wade. The email included the weekly update for the week of July 20 through July 25. In addition was special notes andupdates that included the extension of the project date. The fieldwork should now be complete August 7. She continued by saying that the Hartel parcel has been completed. She finished by alerting the THPOs to the fact that the site that ERM arcaheologists and TCSs had disagreements regarding will continue to be recorded while submitting approapriate paperwork describing the TCSs disagreement. Raina closed out the email by saying that arrangements were being made to accommadate the extension of fieldwork and that if any TCSs needed swapped out for the new time frame to let BCA know.
	At 3:15 pm CST, Raina emailed all project-specific applicable THPOs, cc'ing Wade. She explained that she just received the most updated version of the survey schedule by ERM. Raina told the THPOs that she will keep them up to date to all changes as soon as she learned of them, noting that TCSs may know of changes sooner directly from ERM field crew.
8/7/2020	
	At 10:24 am CST, Raina sent an email to all project-specific applicable THPOs. The email contained the weekly update for July 27 through August 1. In the email she updating the THPOs to the extended completion date being August 14th. This is because of a large stone feature that was discovered. TCS and ERM arcaheologists continue to disagree over the validity of a site as well. Raina closed out the email by saying that BCA will be keeping THPOs and TCSs updated as much as possible.
8/10/2020	
	At 9:35 am CST, Raina sent an email to all project-specific applicable THPOs. The email came as a onfirmation that fieldwork should be completed sometime this week. She said that TCSs will be released as soon as fieldwork is completed.

8/11/2020	
	At 11:44 am CST, Raina emailed all project-specific applicable THPOs. The email contained the ninth weekly update (August 3 through August 8). Raina added that fieldwork will be completed on the tenth week and that BCA and participating TCSs will be returning to the Hartel property to survey a reroute. She closed the email out by explaining that the TCSs sentiments regarding the stone features in the site revisits had been outlined in the attached update.
	At 6:29 pm CST, Raina emailed all project-specific applicable THPOs. In the email she outlined that she had received confirmation of the reroute touch-up survey. She explained that the survey will most-likely occur on Thursday of that week and will cover less than 5 acres of primarily plowed agricultural field. Raina closed by saying that they are on track to release the TCSs on Friday or Saturday of that week.
8/14/2020	
	At 3:11 pm CST, Raina emailed all project-specific applicable THPOs with the final weekly update for the project. The attached document covered August 10 through August 13. She included in the email that fieldwork has ceased pending fields being harvested and that the Hartel reroute touch-up survey came up as no cultural material. Lastly, she concluded that there had been two more sites discovered that were disagreed upon by TCSs and ERM arcaheologists. She said that the same protocols will be followed for these new sites as the first site that was disagreed upon.
8/31/2020	
	At 3:01 pm CST, Raina emailed all project-specific applicable THPOs letting them know that BCA has been mapping and documenting the sites and features recorded by TCSs. BCA will be getting shapefiles data over to WBI and ERM that week for review and avoidance planning. Raina explained that ERM and WBI will plan to avoid site boundaries for stone feature sites on private and/or state surface by a 50' minimum as well as fencing off the project's ROW corridor. She continued by saying that BCA is working on completing the North Dakota Heritage Forms for SHPO though the information provided in those forms will have no affect archaeologically but will reflect the feature/site details provided by TCSs that has been approved to be doumented and shared. Raina concluded by saying that during a call with ERM and WBI the previous Friday that ERM plans on resuming the remaining fieldwork starting September 9th and that it should take approximately 4 weeks. She requested that any THPO that can send TCss for the second mobilization of fieldwork let her know as soon as possible.
9/2/2020	
	At 10:41 am CST, Raina emailed all project-specific applicable THPOS. In the email she lists the contact information for FERC's Dawn Ramsey.
	At 11:18 am CST, Raina emailed all project-specific applicable THPOs. She explained that BCA has no issues with Jon's request but state and federal agencies would have to speak to the request. Raina said that she had forwarded the request on to the appropriate individuals at ERM and WBI. She let them know that she will let them know when she gets a response.
	At 11:55 am CST, Raina emailed all project-specific applicable THPOs. She answered Jon's question by saying that WBI would be that authority.
	At 2:40 pm CST, Raina emailed all project-specific applicable THPOs. In her email she listed the contacts for WBI and ERM (Jill Linn and Pat Robblee, respectively). She also explained who would be best to address certain questions.

	At 11:10 am CST, Raina emailed all project-specific applicable THPOS. She gave an update on the first week of the second mobilization for the project as well as the site visit form September 11.
	At 11:47 am CST, Raina emailed all project-specific applicable THPOs. She resent the first weekly update for the second mobilization.
9/18/2020	
	At 9:48 am CST, Raina emailed all project- specific applicable THPOs. She provided an update regarding the site visit the day before.

Communications with the Fort Peck Tribe

Date	Summary
7/23/2020	
	At 12:25 pm CST, Raina emailed all project-specific applicable THPOs, cc'ing all state and federal agencies (excluding FERC). In the email, Raina attached the sixth weekly update for the project. Included in the email were some special notes regarding the planned end date for the project as well as providing updates with respect to the Hartel property and BCA20-1313-CHFMSite15.
7/31/2020	
	At 2:19 pm CST, Raina sent and email to all project-specific applicable THPOS, cc'ing Wade. The email included the weekly update for the week of July 20 through July 25. In addition was special notes and updates that included the extension of the project date. The fieldwork should now be complete August 7. She continued by saying that the Hartel parcel has been completed. She finished by alerting the THPOs to the fact that the site that ERM archaeologists and TCSs had disagreements regarding will continue to be recorded while submitting appropriate paperwork describing the TCSs disagreement. Raina closed out the email by saying that arrangements were being made to accommodate the extension of fieldwork and that if any TCSs needed swapped out for the new time frame to let BCA know.
	At 3:15 pm CST, Raina emailed all project-specific applicable THPOs, cc'ing Wade. She explained that she just received the most updated version of the survey schedule by ERM. Raina told the THPOs that she will keep them up to date to all changes as soon as she learned of them, noting that TCSs may know of changes sooner directly from ERM field crew.
	At 4:20 pm CST, Dyan Youpee emailed Raina cc'ing all project-specific applicable THPOs, acknowledging Rina's update and stating that FT. Peck will be able to keep their TCSs throughout the rest of the project.
8/7/2020	
	At 10:24 am CST, Raina sent an email to all project-specific applicable THPOs. The email contained the weekly update for July 27 through August 1. In the email, she updating the THPOs to the extended completion date being August 14th. This is because of a large stone feature that was discovered. TCS and ERM archaeologists continue to disagree over the validity of a site as well. Raina closed out the email by saying that BCA will be keeping THPOs and TCSs updated as much as possible.
8/10/2020	
	At 9:35 am CST, Raina sent an email to all project-specific applicable THPOs. The email came as a confirmation that fieldwork should be completed sometime this week. She said that TCSs will be released as soon as fieldwork is completed.

8/11/2020	
	At 11:44 am CST, Raina emailed all project-specific applicable THPOs. The email contained the ninth weekly update (August 3 through August 8). Raina added that fieldwork will be completed on the tenth week and that BCA and participating TCSs will be returning to the Hartel property to survey a reroute. She closed the email out by explaining that the TCSs sentiments regarding the stone features in the site revisits had been outlined in the attached update.
	At 6:29 pm CST, Raina emailed all project-specific applicable THPOs. In the email she outlined that she had received confirmation of the reroute touch-up survey. She explained that the survey will most-likely occur on Thursday of that week and will cover less than five acres of primarily plowed agricultural field. Raina closed by saying that they are on track to release the TCSs on Friday or Saturday of that week.
8/14/2020	
	At 3:11 pm CST, Raina emailed all project-specific applicable THPOs with the final weekly update for the first mobilization of the project. The attached document covered August 10 through August 13. She included in the email that fieldwork has ceased pending fields being harvested and that the Hartel reroute touch-up survey came up as no cultural material. Lastly, she concluded that there had been two more sites discovered that were disagreed upon by TCSs and ERM archaeologists. She said that the same protocols will be followed for these new sites as the first site that was disagreed upon.
8/31/2020	
	At 3:01 pm CST, Raina emailed all project-specific applicable THPOs letting them know that BCA has been mapping and documenting the sites and features recorded by TCSs. BCA will be getting shapefiles data over to WBI and ERM that week for review and avoidance planning. Raina explained that ERM and WBI will plan to avoid site boundaries for stone feature sites on private and/or state surface by a 50' minimum as well as fencing off the project's ROW corridor. She continued by saying that BCA is working on completing the North Dakota Heritage Forms for SHPO though the information provided in those forms will have no affect archaeologically but will reflect the feature/site details provided by TCSs that has been approved to be documented and shared. Raina concluded by saying that during a call with ERM and WBI the previous Friday that ERM plans on resuming the remaining fieldwork starting September 9th and that it should take approximately 4 weeks. She requested that any THPO that can send Tus for the second mobilization of fieldwork let her know as soon as possible.
9/2/2020	
	At 10:41 am CST, Raina emailed all project-specific applicable THPOS. In the email she lists the contact information for FERC's Dawn Ramsey.
	At 11:18 am CST, Raina emailed all project-specific applicable THPOs. She explained that BCA has no issues with Jon's request but state and federal agencies would have to speak to the request. Raina said that she had forwarded the request on to the appropriate individuals at ERM and WBI. She let them know that she will let them know when she gets a response.
	At 11:55 am CST, Raina emailed all project-specific applicable THPOs. She answered Jon's question by saying that WBI would be that authority.
	At 2:40 pm CST, Raina emailed all project-specific applicable THPOs. In her email she listed the contacts for WBI and ERM (Jill Linn and Pat Robblee, respectively). She also explained who would be best to address certain questions.

9/3/2020	
	At 5:51 pm CST, Raina emailed all project-specific applicable THPOs. The email was a reminder of the second mobilization starting the following week. She provided the current travel date and asked that any THPOs that can send a TCS let her know. She also mentioned the two documents that she had attached that listed the known and new CHF interpretations for their review.
9/4/2020	
	At 8:02 am CST, Raina emailed all project-specific applicable THPOs that the start date for the second mobilization had been moved back to September 11 and that the travel day will be September 10th.
	At 1:25 pm CST, Raina emailed all project-specific applicable THPOs and BCA staff. The email was a reminder of dates and that THPOs should let BCA know if they plan on sending a TCS for the mobilization.
	At 3:29 pm CST, Raina emailed all project-specific applicable THPOs, cc'ing BCA staff. She attached a pdf of the combined known and new CHF sites. She tells them to let her know if they have any questions or concerns about the mobilization.
9/8/2020	
	At 9:32 am CST, Raina emailed all project-specific applicable THPOs. She provided them an update to the fieldwork scheduling from ERM. She also let them know that all THPOs that have confirmed a TCS will be getting a phone call.
	At 9:48 am CST, Raina called Dyan. Dyan let Raina know that she is unsure if a TCS will be available for the second mobilization. She expressed her concerns over site recording and expressed interest in doing a site visit.
	At 5:43 pm CST, Dyan emailed Pat Robblee, Jill Linn, Raina, Andrew Clark of SHPO, Floyd Azure of Fort Peck, Ben Rhodd of Rosebud, Jon Eagle of SRST and Dianne Desrosiers of SWO. She expressed her concerns over the recording of sites and the disagreement between TCSs and ERM archaeologist. She explained which CHF she had an issue with.
9/9/2020	
	At ~3:00 pm Raina and Wade called Dyan. They alerted her to an issue with CHFM 5 and discussed the site visit on September 11.
	At 3:50 pm CST, Raina emailed all project-specific applicable THPOs, cc'ing applicableBCA staff, Pat Robblee, Andrea Thornton, and Kevin Malloy. In her email she explains that efforts were being made to look at the site specified by Ft. Peck on September 11. She said that if anyone wanted to participate to let Raina know. She also said that more details on the meeting will come later. Raina addressed the inquiries regarding CHFM 5 and that after some digging, the feature will stay recorded and that the PDF will be updated.
9/10/2020	
	At 10:30 am CST, Raina emailed Jill and all project-specific applicable THPOs, cc'ing applicable BCA staff, Pat, Andrea and Kevin. The email was a reminder of the site visit the next day. Included in the the email was a list of the currently confirmed attendants and the meeting time, date and location of the meeting.
	At 10:34 am CST, Raina emailed Jill and all project-specific applicable THPOs, cc'ing applicable BCA staff, Pat, Andrea and Kevin. The email was a reminder of the site visit the next day. Included in the the email was an additional participant that wasn't listed in the previous email.

9/14/2020	
	At 11:10 am CST, Raina emailed all project-specific applicable THPOS. She gave an update on the first week of the second mobilization for the project as well as the site visit form September 11.
	At 11:47 am CST, Raina emailed all project-specific applicable THPOs. She resent the first weekly update for the second mobilization.
9/18/2020	
	At 9:48 am CST, Raina emailed all project- specific applicable THPOs. She provided an update regarding the site visit the day before.
	At ~1 pm and 3 pm CST, Raina spoke to Dyan In both phone calls Dyan instructed Raina to remove her from all THPO weekly updates as she is no longer interested in receiving them. She clarified that she will be keeping her TCS in the field and that she would like to receive the report to review and comment on.

Communications with the Rosebud Sioux Tribe

Date	Summary
7/21/2020	
	At 11:44 am CST, Ben Young emailed Raina. He asked if the project is demobilizing or if just ERM staff were demobilizing.
	At 12:34 pm CST, Raina emailed Ben Young to let him know that she is reaching out to ERM to find out their plans.
	At 12:37 pm CST, Raina emailed Ben Young to clarify her earlier email. She explained that she knew that the surveys were finishing up this week and that site reviews for sites found in 2019 would occur next week.
7/23/2020	
	At 12:25 pm CST, Raina emailed all project-specific applicable THPOs, cc'ing all state and federal agencies (excluding FERC). In the email, Raina attached the sixth weekly update for the project. Included in the email were some special notes regarding the planned end date for the project as well as providing updates with respect to the Hartel property and BCA20-1313-CHFMSite15.

9/4/2020	
	At 8:02 am CST, Raina emailed all project-specific applicable THPOs that the start date for the second mobilization had been moved back to September 11 and that the travel day will be September 10th.
	At 1:25 pm CST, Raina emailed all project-specific applicable THPOs and BCA staff. The email was a reminder of dates and that THPOs should let BCA know if they plan on sending a TCS for the mobilization.
	At 1:30 pm CST, Raina emailed Ben Young to provide the update on the schedule for the second mobilization for him and Mary Waln.
	At 3:29 pm CST, Raina emailed all project-specific applicable THPOs, cc'ing applicable BCA staff. She attached a PDF of the combined known and new CHF sites. She tells them to let her know if they have any questions or concerns about the mobilization.
9/8/2020	
	At 9:32 am CST, Raina emailed all project-specific applicable THPOs. She provided them an update to the fieldwork scheduling from ERM. She also let them know that all THPOs that have confirmed a TCS will be getting a phone call.

9/9/2020	

	At 10:27 am CST, Ben Young emailed Raina asking if SWO was planning on sending a TCS.
	At 1:42 pm CST, Raina emailed Ben Young that SWO has not alerted BCA of them sending a TCS.
	At 3:50 pm CST, Raina emailed all project-specific applicable THPOs, CC'ing BCA staff, Pat Robblee, Andrea Thornton, and Kevin Malloy. In her email she explains that efforts were being made to look at the site specified by Ft. Peck on September 11. She said that if anyone wanted to participate to let Raina know. She also said that more details on the meeting will come later. Raina addressed the inquiries regarding CHFM 5 and that after some digging, the feature will stay recorded and that the PDF will be updated.
9/10/2020	
	At 9:02 am CST, Ben Young called the BCA office to talk to Raina. She was unavailable so he left a message for her. He asked for her to call back to the office to speak to him or Ben Rhodd and he left the office number.
	At 9:12 am CST, Ben Rhodd emailed Raina. He explained that Rosebud will send an extra TCS on behalf of SWO and to expect a confirmation email from SWO in that regard.
	At 9:55 am CST, Raina emailed Ben Rhodd. She thanked him for letting her know and asked if there was a specific TCS in mind to send for SWO.
	At 10:04 am CST, Ben Rhodd emailed Raina saying that Mary Waln will be sent as a TCS.
	At 10:05 am CST, Raina emailed Ben Rhodd. She clarified her earlier question specifying who will be sent on SWO's behalf.
	At ~10:10 am CST, Raina called the THPO office to talk to Ben Young. He was unavailable so she left a message for him. She asked for him to call her back at the office number.
	At 10:30 am CST, Raina emailed Jill and all project-specific applicable THPOs, cc'ing applicable BCA staff, Pat, Andrea and Kevin. The email was a reminder of the site visit the next day. Included in the the email was a list of the currently confirmed attendants and the meeting time, date and location of the meeting.
	At 10:34 am CST, Raina emailed Jill and all project-specific applicable THPOs, cc'ing applicable BCA staff, Pat, Andrea and Kevin. The email was a reminder of the site visit the next day. Included in the the email was an additional participant that wasn't listed in the previous email.
	At 11:25 am CST, Ben Rhodd emailed Raina clarifying that Mary Waln will participate on behalf of SWO.
	At 11:51 am CST, Raina emailed Ben Rhodd. She clarified that she has Mary Waln down for SWO and Chris Boyd for Rosebud
	At 2:26 pm CST, Ben Rhodd emailed Raina asking if there was a possibility of having a site visit on September 18th. He also suggested this to Jon Eagle
	At 3:05 pm CST, Raina emailed Ben Rhodd, cc'ing Jill and Wade. She said that she will pass his request on to Jill to see when a site visit will be plausible.
	At 5:09 pm CST, Ben Rhodd emailed Raina. He said that Rosebud would participate in the site visit on Thursday September 17th.
	At 5:13 pm CST, Raina emailed Ben Rhodd. Raina asked Ben if there was any sites in particular that he would like to visit.

9/14/2020

	At 11:10 am CST, Raina emailed all project-specific applicable THPOS. She gave an update on the first week of the second mobilization for the project as well as the site visit form September 11.
	At 11:47 am CST, Raina emailed all project-specific applicable THPOs. She resent the first weekly update for the second mobilization.
9/15/2020	
	At 2:30 pm CST, Ben Young called Raina and asked if BCA/WBI will pay for Ben Rhodd's travel expenses for the site visit September 17 or else he would not be able to attend.
	At 2:35 pm CST, Raina called Ben Young. She let him know that BCA will get everything figured out to that Ben Rhodd will be able to attend.
	At 2:52 pm CST, Raina emailed Ben Young and Ben Rhodd, cc'ing applicable BCA Staff. The email contained the hotel room confirmation for Ben Rhodd.
	At 3:28 pm CST, Ben Rhodd emailed Raina. He thanked her for setting up the hotel. He told her that he just talked to Jill regarding mileage and per diem.
	At 5:19 pm CST, Raina emailed Ben Rhodd and Ben Young, cc'ing Jill. She said that There will be a check for Ben ready at the meeting and provided as breakdown of the components of the check.
9/17/2020	
	At 7:46 am CST, Ben Rhodd emailed Raina. He let her know he was in Watford. He was making sure that they were meeting at Tobacco Gardens at 10 am.
9/18/2020	
	At 9:48 am CST, Raina emailed all project- specific applicable THPOs. She provided an update regarding the site visit the day before.

Communications with the Oglala Sioux Tribe

9/4/2020	
	At 8:02 am CST, Raina emailed all project-specific applicable THPOs that the start date for the second mobilization had been moved back to September 11 and that the travel day will be September 10th.
	At 1:25 pm CST, Raina emailed all project-specific applicable THPOs and applicable BCA staff. The email was a reminder of dates and that THPOs should let BCA know if they plan on sending a TCS for the mobilization.
	At 3:29 pm CST, Raina emailed all project-specific applicable THPOs, cc'ing applicable BCA staff. She attached a pdf of the combined known and new CHF sites. She tells them to let her know if they have any questions or concerns about the mobilization.
9/8/2020	
	At 9:32 am CST, Raina emailed all project-specific applicable THPOs. She provided them an update to the fieldwork scheduling from ERM. She also let them know that all THPOs that have confirmed a TCS will be getting a phone call.
9/9/2020	
	At 8:50 am CST, Jon emailed Jill Linn, Raina, and all project-specific applicable THPOs, cc'ing applicable BCA staff, Pat Robblee and Andrea Thornton of ERM. He tanked Jill for her response and suggested site visits with the archaeologists.
	At 3:50 pm CST, Raina emailed all project-specific applicable THPOs, cc'ing applicable BCA staff, Pat Robblee, Andrea Thornton, and Kevin Malloy. In her email she explains that efforts were being made to look at the site specified by Ft. Peck on September 11. She said that if anyone wanted to participate to let Raina know. She also said that more details on the meeting will come later. Raina addressed the inquiries regarding CHFM 5 and that after some digging, the feature will stay recorded and that the PDF will be updated.

9/10/2020	
	At 10:30 am CST, Raina emailed Jill and all project-specific applicable THPOs, cc'ing applicable BCA staff, Pat, Andrea and Kevin. The email was a reminder of the site visit the next day. Included in the the email was a list of the currently confirmed attendants and the meeting time, date and location of the meeting.
	At 10:30 am CST, Raina emailed Jill and all project-specific applicable THPOs, cc'ing applicable BCA staff, Pat, Andrea and Kevin. The email was a reminder of the site visit the next day. Included in the the email was an additional participant that wasn't listed in the previous email.
	At 1:43 pm CST, Raina received an automatic email claiming that the delivery of an email to Thomas was delayed.
	At 6:04 pm CST, Raina received an automatic email saying that the delayed email had been delivered.
9/14/2020	
	At 11:10 am CST, Raina emailed all project-specific applicable THPOS. She gave an update on the first week of the second mobilization for the project as well as the site visit form September 11.
	At 11:47 am CST, Raina emailed all project-specific applicable THPOs. She resent the first weekly update for the second mobilization.
	At 3:04 pm CST, Raina received an automatic email claiming that the delivery of an email to Thomas was successful.
9/18/2020	
	At 9:48 am CST, Raina emailed all project- specific applicable THPOs. She provided an update regarding the site visit the day before.

Communications with the Northern Arapaho

Date	Summary
7/23/2020	
	At 12:25 pm CST, Raina emailed all project-specific applicable THPOs, cc'ing all state and federal agencies (excluding FERC). In the email, Raina attached the 6th weekly update for the project. Included in the email were some special notes regarding the planned end date for the project as well as providing updates with respect to the Hartel property and BCA20-1313-CHFMSite15.
	At 12:25 pm CST, Raina received an automated email response from the Northern Arapaho THPO regarding office closures due to COVID-19. The email provided an urgent number (999-999-2903) and non urgent number (999-999-1628) for immediate and eventual responses as Northern Arapaho checks their voice messages.
7/31/2020	
	At 2:19 pm CST, Raina sent and email to all project-specific applicable THPOS, cc'ing Wade. The email included the weekly update for the week of July 20 through July 25. In addition was special notes and updates that included the extension of the project date. The fieldwork should now be complete August 7. She continued by saying that the Hartel parcel has been completed. She finished by alerting the THPOs to the fact that the site that ERM archaeologists and TCSs had disagreements regarding will continue to be recorded while submitting appropriate paperwork describing the TCSs disagreement. Raina closed out the email by saying that arrangements were being made to accommodate the extension of fieldwork and that if any TCSs needed swapped out for the new time frame to let BCA know.
	At 2:22 pm CST, Raina received an automated email response from the Northern Arapaho THPO regarding office closures due to COVID-19. The email provided an urgent number (999-999-2903) and non urgent number (999-999-1628) for immediate and eventual responses as Northern Arapaho checks their voice messages.
	At 3:15 pm CST, Raina emailed all project-specific applicable THPOs, cc'ing Wade. She explained that she just received the most updated version of the survey schedule by ERM. Raina told the THPOs that she will keep them up to date to all changes as soon as she learned of them, noting that TCSs may know of changes sooner directly from ERM field crew.
8/7/2020	
	At 10:24 am CST, Raina sent an email to all project-specific applicable THPOs. The email contained the weekly update for July 27 through August 1. In the email she updating the THPOs to the extended completion date being August 14. This is because of a large stone feature that was discovered. TCSs and ERM archaeologists continue to disagree over the validity of a site as well. Raina closed out the email by saying that BCA will be keeping THPOs and TCSs updated as much as possible.
	At 10:24 am CST, Raina received an automated email response from the Northern Arapaho THPO regarding office closures due to COVID-19. The email provided an urgent number (999-999-2903) and non urgent number (999-999-1628) for immediate and eventual responses as Northern Arapaho checks their voice messages.

8/10/2020	
	At 9:35 am CST, Raina sent an email to all project-specific applicable THPOs. The email came as a confirmation that fieldwork should be completed sometime this week. She said that TCSs will be released as soon as fieldwork is completed.
8/11/2020	
	At 11:44 am CST, Raina emailed all project-specific applicable THPOs. The email contained the ninth weekly update (August 3 through August 8). Raina added that fieldwork will be completed on the tenth week and that BCA and participating TCSs will be returning to the Hartel property to survey a reroute. She closed the email out by explaining that the TCSs sentiments regarding the stone features in the site revisits had been outlined in the attached update.
	At 11:45 am CST, Raina received an automated email response from the Northern Arapaho THPO regarding office closures due to COVID-19. The email provided an urgent number (999-999-2903) and non urgent number (999-999-1628) for immediate and eventual responses as Northern Arapaho checks their voice messages.
	At 6:29 pm CST, Raina emailed all project-specific applicable THPOs. In the email she outlined that she had received confirmation of the reroute touch-up survey. She explained that the survey will most-likely occur on Thursday of that week and will cover less than five acres of primarily plowed agricultural field. Raina closed by saying that they are on track to release the TCSs on Friday or Saturday of that week.
8/14/2020	
	At 3:11 pm CST, Raina emailed all project-specific applicable THPOs with the final weekly update for the project. The attached document covered August 10 through August 13. She included in the email that fieldwork has ceased pending fields being harvested and that the Hartel reroute touch-up survey came up as no cultural material. Lastly, she concluded that there had been two more sites discovered that were disagreed upon by TCSs and ERM archaeologists. She said that the same protocols will be followed for these new sites as the first site that was disagreed upon.
8/31/2020	
	At 3:01 pm CST, Raina emailed all project-specific applicable THPOs letting them know that BCA has been mapping and documenting the sites and features recorded by TCSs. BCA will be getting shapefiles data over to WBI and ERM that week for review and avoidance planning. Raina explained that ERM and WBI will plan to avoid site boundaries for stone feature sites on private and/or state surface by a 50' minimum as well as fencing off the project's ROW corridor. She continued by saying that BCA is working on completing the North Dakota Heritage Forms for SHPO though the information provided in those forms will have no affect archaeologically but will reflect the feature/site details provided by TCSs that has been approved to be documented and shared. Raina concluded by saying that during a call with ERM and WBI the previous Friday that ERM plans on resuming the remaining fieldwork starting September 9th and that it should take approximately 4 weeks. She requested that any THPO that can send TCSs for the second mobilization of fieldwork let her know as soon as possible.

9/2/2020	
	At 10:41 am CST, Raina emailed all project-specific applicable THPOs. In the email, she lists the contact information for FERC's Dawn Ramsey.
	At 11:18 am CST, Raina emailed all project-specific applicable THPOs. She explained that BCA has no issues with Jon's request but state and federal agencies would have to speak to the request. Raina said that she had forwarded the request on to the appropriate individuals at ERM and WBI. She let them know that she will let them know when she gets a response.
	At 11:55 am CST, Raina emailed all project-specific applicable THPOs. She answered Jon's question by saying that WBI would be that authority.
9/2/2020	
	At 2:40 pm CST, Raina emailed all project-specific applicable THPOs. In her email she listed the contacts for WBI and ERM (Jill Linn and Pat Robblee, respectively). She also explained who would be best to address certain questions.
9/3/2020	
	At 4:03 pm CST, Jill Linn emailed all project-specific applicable THPOs, Raina and cc'd Pat Robblee and Andrea Thornton of ERM. She addressed Jon saying that she left a voice mail at his office. She then goes on to address his concerns by explaining that WBI contracted ERM for the archaeological work therefore all discussions of sites and the reasons for recording should be addressed by ERM. She says that Pat Robblee had been copied on the email thread so that he can address the concerns as well. She addresses the site visits by saying that WBI, ERM and BCA will be working together to talk to landowners and land management for access to the sites.
	At 5:51 pm CST, Raina emailed all project-specific applicable THPOs. The email was a reminder of the second mobilization starting the following week. She provided the current travel date and asked that any THPOs that can send a TCS let her know. She also mentioned the two documents that she had attached that listed the known and new CHF interpretations for their review.
9/4/2020	
	At 8:02 am CST, Raina emailed all project-specific applicable THPOs that the start date for the second mobilization had been moved back to September 11 and that the travel day will be September 10.
	At 1:25 pm CST, Raina emailed all project-specific applicable THPOs and applicable BCA staff. The email was a reminder of dates and that THPOs should let BCA know if they plan on sending a TCS for the mobilization.
	At 3:29 pm CST, Raina emailed all project-specific applicable THPOs, cc'ing applicable BCA staff. She attached a pdf of the combined known and new CHF sites. She tells them to let her know if they have any questions or concerns about the mobilization.
9/8/2020	
	At 9:32 am CST, Raina emailed all project-specific applicable THPOs. She provided them an update to the fieldwork scheduling from ERM. She also let them know that all THPOs that have confirmed a TCS will be getting a phone call.

9/9/2020	
	At 3:50 pm CST, Raina emailed all project-specific applicable THPOs, cc'ing BCA staff, Pat Robblee, Andrea Thornton, and Kevin Malloy. In her email she explains that efforts were being made to look at the site specified by Ft. Peck on September 11. She said that if anyone wanted to participate to let Raina know. She also said that more details on the meeting will come later. Raina addressed the inquiries regarding CHFM 5 and that after some digging, the feature will stay recorded and that the PDF will be updated.
9/10/2020	
	At 10:30 am CST, Raina emailed Jill and all project-specific applicable THPOs, cc'ing applicable BCA staff, Pat, Andrea and Kevin. The email was a reminder of the site visit the next day. Included in the the email was a list of the currently confirmed attendants and the meeting time, date and location of the meeting.
	At 10:34 am CST, Raina emailed Jill and all project-specific applicable THPOs, cc'ing applicable BCA staff, Pat, Andrea and Kevin. The email was a reminder of the site visit the next day. Included in the the email was an additional participant that wasn't listed in the previous email.
9/14/2020	
	At 11:10 am CST, Raina emailed all project-specific applicable THPOS. She gave an update on the first week of the second mobilization for the project as well as the site visit form September 11.
	At 11:47 am CST, Raina emailed all project-specific applicable THPOs. She resent the first weekly update for the second mobilization.
9/18/2020	
	At 9:48 am CST, Raina emailed all project- specific applicable THPOs. She provided an update regarding the site visit the day before.

Communication with Fort Belknap Indian Reservation

Date	Summary
7/23/2020

Subject: RE: BCA20-1313: THPO/TCS N. Bakken Field Details Update

Good Afternoon,

Attached please find the weekly update for the sixth week of work done during the project.

Special Notes and Updates:

1. We are still planning for the project to end on/right around Saturday, August 1st.
    a. Your TCS may notice and have alerted you that the ERM archaeologists may have less of a presence/be demobilizing, but that is due to project needs as the fieldwork for the project begins to wind down and the number of archaeologists to be on the project not as great.
        i. At this time, the TCSs should continue planning on being needed into next week. We will keep you all posted if there are any significant changes to the anticipated end date.
2. The Hartel survey has begun and is on-going. The fieldwork occurs in the afternoon after the ERM field plans for the day are completed.
    a. In order to keep the archaeological fieldwork methodology consistent for the project, BCA is working with ERM to complete the archaeological fieldwork under the same methodological approach as ERM.
3. During one of the surveys last week, another site was recorded by the ERM archaeologists that the TCS did not believe to be a cultural site. The area in question has been documented by BCA as BCA20-1313-CHFMSite15 and is thought to, by the ERM archaeologists, to consist of one stone circle.
    a. We will plan to follow the same approach as what was and will be done for BCA20-1313-CHFMSite9, specifically:
        i. Accordingly, BCA will plan to submit paperwork, as appropriate and necessary, to reflect the TCSs' sentiments on the item being recorded as a feature and a cultural site.
            1. For our records, at this time, BCA is referring to the area in question as BCA20-1313-CHFMsite15.

a. The area in question is located on Private Property.
b. The ERM archaeologists are recording the location as a stone feature site, and the TCSs are in agreement that it is not a site. The ERM archaeological site form is to note the TCSs disagreement.

b. Both BCA20-1313-CHFMSite9 and BCA20-1313-CHFMSite15 are discussed in the attached Weekly Update PDF.

Thank you,

Raina Hanley

Subject: RE: BCA20-1313: THPO/TCS N. Bakken Field Details Update

Good Afternoon,

Attached please find the weekly update for the seventh week of work done during the project.

Special Notes and Updates:

1. **I have just been made aware the project is now planned to extend into next week.** At this time, I have not been provided a definitive end date.
    - **a.** For all of our planning purposes, I will **estimate the tentative completion to be on Friday, August 7th**.
        - **i.** Part of this delay comes from alignment reroutes that had recently come in and needed to be surveyed. It sounds like some of the survey has already occurred but that there is still a bit more needed.
    - b. I have requested to be provided with an updated schedule so that we may all be aware of any changes to the planned fieldwork and the planned fieldwork dates.
2. The Hartel Parcel survey by BCA archaeologists and TCS has been completed.
    - a. The update on the survey is provided in the attached weekly update.
        - i. One historic cultural resource was documented, BCA20-1080-Site1.
3. During one of the surveys last week, another site was recorded by the ERM archaeologists that the TCS did not believe to be a cultural site. The area in question has been documented by BCA as BCA20-1313-CHFMSite17 and is thought to, by the ERM archaeologists, to consist of an arc, two stone circles (one with a possible cairn/hearth), and two cairns.
    - a. We will plan to follow the same approach as what was and will be done for BCA20-1313-CHFMSite9 and BCA20-1313-CHFMSite15, specifically:
        - i. Accordingly, BCA will plan to submit paperwork, as appropriate and necessary, to reflect the TCSs' sentiments on the item being recorded as a feature and a cultural site.
            1. For our records, at this time, BCA is referring to the area in question as BCA20-1313-CHFMsite17.
                - a. The area in question is located on Private Property.
                - b. The ERM archaeologists are recording the location as a stone feature site, and the TCSs are in agreement that it is

not a site. The ERM archaeological site form is to note the TCSs disagreement.

b. BCA20-1313-CHFMSite17 is discussed in the attached Weekly Update PDF.

I know some of the TCSs have already alerted their THPOs as to the extended scheduling, and arrangements are being made. Please let me know if any TCSs need to be swapped out for next week's work or if you will not be able to have a TCS on location.

Thank you,

Subject: RE: BCA20-1313: THPO/TCS N. Bakken Field Details Update

Good Morning,

Attached please find the weekly update for the eighth week of work on WBI's North Bakken Pipeline project.

Special Notes and Updates:

1. **Due to the discovery of a large stone feature site earlier this week and the crews attempts to look for a clear reroute option, the project is now planned to extend into next week.** At this time, I do not have an anticipated end date. For all of our planning purposes, I will **estimate the tentative completion to be on Friday, August 14th.**
2. The site reviews have been on-going. There has been one adjustment to one of the sites that the TCSs disagreed with the ERM archaeologists on, BCA20-1313-CHFMSITE9, during the site review one of the TCSs documented an arc. The other reviewing TCSs agreed with the documentation. All of the TCSs continue to disagree with the remainder of the features documented by the ERM archaeologists.
3. The attached weekly update details the reviewing TCSs sentiments on the features documented at stone feature sites discovered in 2019 and 2020 within the projects planned right-of-way (ROW).

NOTE: Given the recent cultural findings and reroute alignment changes to accommodate the newly documented stone feature sites as well as other alignment change variables, the final date I estimate above is subject to change, either shortened or extended, depending on finalized routing tweaks and adjustments.

I will do my best to provide you and the TCSs with as much advance notice as possible as to the updated end date. The TCSs may end up with the most current and real-time information.

Thank you,
Raina Hanley

Subject: RE: BCA20-1313: THPO/TCS N. Bakken Field Details Update

Good Morning,

Attached please find the weekly update for the ninth week of work on WBI's North Bakken Pipeline project.

Special Notes and Updates:

1.) As discussed in the email below, the project is anticipated to be completed this week.
2.) Earlier today, I was alerted that the BCA archaeologists and participating TCSs will need to return to the Hartel property to survey a reroute corridor in order to avoid a Dakota Skipper habitat area.
    a. We have received a preliminary reroute alignment and hope to have more information from ERM/WBI for a more finalized survey time by tomorrow (Wednesday, 8/12).
    b. We hope to have this completed this week before releasing the remaining TCSs from the project.
3.) The attached weekly update details the reviewing TCSs sentiments on the features documented at stone feature sites discovered in 2019 and 2020 within the projects planned right-of-way (ROW).

Subject: RE: BCA20-1313: THPO/TCS N. Bakken Field Details Update

Good Afternoon,

Attached please find the weekly update for the tenth and final week of work on WBI's North Bakken Pipeline project.

Special Notes and Updates:

1.) For the time being, fieldwork for the project has ceased pending fields being harvested.
2.) Hartel Touch-up survey, with the BCA archaeologists, has been completed. No cultural resources were encountered.
    a. BCA will plan to write our own report about the Hartel surveys that will be incorporated into the full ERM report.
3.) During the surveys this week, another two sites were recorded by the ERM archaeologists that the TCS did not believe to be a cultural feature or site. The areas in question have been documented by BCA as BCA20 1313 CHFMSite26 and BCA20 1313 CHFMSite27. Both areas were documented by the ERM archaeologists as single stone circle feature sites.
    a. BCA will plan to follow the same protocols as previously detailed in my earlier updates for instances such as these.

Subject: RE: BCA20-1313: THPO/TCS N. Bakken Field Details Update

Good Afternoon,

I hope everyone has been well and having a pleasant field season. While away from the fieldwork efforts for the subject line project, we have been working on the mapping and documentation of the features and sites documented by the participating TCSs. We will get our shapefile data over to ERM and WBI this week for their review and avoidance planning efforts. Per the guidance provided by the SHPO during the review of the report detailing ERM's 2019 fieldwork efforts, ERM and WBI plan to avoid the site boundaries for the stone features sites on private and/or state surface by a minimum of 50'. If I understood correctly, it also sounded like ERM and WBI plan to fence the project ROW corridor as a part of their avoidance measures too. In the meantime, and as these items are being discussed, we are also working on completing the North Dakota Heritage Forms for submission to the SHPO. The information we submit as a part of the cultural heritage documentation will include no influence of archaeological thought; the information will merely reflect the feature and/or site details that BCA was provided by the participating TCSs, that is approved to be documented and shared with the agencies, and other THPOs.

Finally, during a call with ERM and WBI last Friday afternoon, we were informed that **ERM plans to resume the remaining fieldwork efforts starting on/around Wednesday, September 9th**. The additional fieldwork would include survey of additional alignment touchups, surveys of the segments of the line in agricultural fields that ERM wanted to be harvested prior to survey, as well as the evaluative test excavation work to occur to the site on USACE surface. The fieldwork efforts are approximated to take a few weeks, as such I would say **the additional fieldwork should take approximately 4 weeks**.

At your earliest convenience, **please let us know if your THPO is willing and able to send one TCS to participate in the remaining 2020 fieldwork efforts** for WBI's North Bakken Pipeline Expansion project. Also, *if you have the name and contact information of the TCS you plan to send, that would be helpful and greatly appreciated* for our planning and scheduling efforts.

Thank you and take care,

Raina Hanley

Subject: RE: BCA20-1313: THPO/TCS N. Bakken Field Details Update

Good morning,

I'm concerned that ERM archaeologists are recording a site that Tribal Cultural Specialist believe not to be a cultural feature. When I think about the difference between an archaeologist and I, and our abilities to identity a site, I think about it like this. An archaeologist is drawing from a different data base than I am. They are drawing from their education, training and experience, where as I am drawing from a way of life, that includes my people's oral history and sacred knowledge. I would like to request a site visit to see for myself what ERM has identified.

I would also like to know who the lead federal agency is and am requesting their contact information.

Good afternoon Mr. Eagle,

I left a voice message at your office but wanted to follow up in an e-mail as well. Based on the e-mail chain below, I understand you have concerns with ERM archaeologists recording sites that Tribal Cultural Specialists believe not to be a cultural feature. As you know, WBI Energy has contracted ERM to complete the archaeological work for this proposed project route. Therefore, I will defer any discussion of the individual sites and the reasons for recording them to ERM representatives. As such, Pat Roblee with ERM, who is copied on this e-mail, will be reaching out to you as well to discuss your concerns.

You also requested access to sites so that you, and other THPOs that would like to, are able to review them. WBI Energy, together with ERM and BCA, will certainly work with landowners and land management agencies to accommodate this request for any that are interested in participating.

Please feel free to call me with any additional questions or concerns regarding the project. As I said, Pat will be reaching out to discuss the sites in question and establish a list of sites you are interested in visiting.

Thank you,

Jill Linn
Environmental Manager

Good Evening,

I have received some responses and some confirmations regarding TCS involvement for the planned second mobilization next week. Please let this email serve as a reminder of the upcoming planned second mobilization occurring next week. The details are in the email below. I currently have the travel day as Tuesday, 9/8. At your earliest convenience, please let me know if you are willing and/or able to send a TCS to participate in the second mobilization.

Also, as we prepare and review the field data from the first mobilization, we have compiled this information into two documents with the information presented in tabular format. Attached please find the detailed and comprehensive lists regarding feature/site interpretations. I have attached two documents. One document for newly recorded sites with CHF interpretations and one document with known sites and the CHF interpretations. NOTE: The lists of interpretations account for the interpretations from the various project components (including the site visits that occurred at the very end of the testing and survey work).

Thank you,

Good Afternoon,

Please let me know if anyone has any questions or concerns regarding the start date for the second mobilization. We can of course be flexible as to TCS arrival due to the confusion and various project components.

Also, for your ease of reference and review, I have attached a PDF document that combines and that hopefully more clearly and easily details the New versus Known/Previously Recorded CHF documentation. I hope you all find this document more helpful and easier to use. Please let me know if you have any issues using the PDF. I can always send the Word document of this, if that is easier.

Thank you,

Subject: RE: BCA20-1313: THPO/TCS N. Bakken Field Details Update

Good Afternoon,

As I understand it, efforts are being made to look at the specific CHFM sites the THPO from Ft. Peck requested, and that we have access to, this coming Friday, 9/11. Anyone else who is interested is welcome to join and just needs to let us know. I do not believe we have a specific time set but we're looking at meeting in Williston around 10 AM Central. Please let us know if you plan to be in attendance. I will get some additional meeting details emailed out tomorrow.

With that said, upon receiving additional inquiries regarding CHFM 5, we did some additional digging into the notes and with the representing BCA field staff. As such, we came to the following conclusion; it seems as though the cairn was agreed upon by ERM and the TCS; however, the TCSs were exploring another potential feature that was determined to be a non-feature. As such, CHFM 5 will continue to be recorded by us as a cultural cairn as agreed upon by ERM and TCSs. We will not be including the other potential feature that was determined not to be a feature. The updated PDF list reflecting this correction is attached to this email.
Also, for everyone's knowledge, CHFM 5 is located just outside of the survey corridor for the project. Nonetheless, we will continue to record it as a CHFM.

I apologize for any confusion we may have caused.

Subject: RE: BCA20-1313: THPO/TCS N. Bakken Field Details Update

Good Morning,

I just wanted to follow-up and see if any of the other THPOs had intentions of participating in tomorrow's field reviews? As of now I have Fort Peck and Standing Rock confirmed for participation. At your earliest convenience, please let me know if you plan to be in attendance.

As for non-tribal participants I currently have the following: Wade, myself and one of our field reps from the project for BCA, Jill with WBI will be present. Also, as of this morning, the USFS, SHPO, and BLM have been invited to participate in the field review. I have received a confirmation thus far from one of the USFS archaeologists and one of the BLM archaeologists that they will be in attendance tomorrow.

Meeting Day and Time Reminder:

Tomorrow, Friday, September 11, 2020, at 11 AM Central/10 AM Mountain at the Tobacco Garden Bay Resort & Marina Recreational Area. We can caravan from there. The meeting point is located at:

Subject: RE: BCA20-1313: THPO/TCS N. Bakken Field Details Update

Good Morning,

We will be heading out shortly for today's site visit with Ft. Peck and any of the other THPOs that are interested and able to attend. We will keep everyone updated regarding today's visit. As a second visit is being potentially planned for next week, I wanted to make sure it didn't conflict with next weeks TCC meeting hosted by the NDDOT. As I understand it, the TCC meeting is to be the mornings of Tuesday, 9/15 through Thursday, 9/17.

Also, to address any potential concerns regarding today's visit without SRST, we are continuing with today's review for multiple reasons. One is because WBI/ERM is trying to coordinate a call with the FERC project manager so that the tribes can talk to the FERC project manager. As I understand it, and as I believe she informed some of the THPOs already, Dyan at Ft. Peck wanted to see some of the sites around/before the time that ERM submits their report of the work completed thus far to the FERC (they will be submitting the report to FERC tomorrow). Dyan also wanted to make sure she saw some of the areas in question before any call is had between the tribes and the FERC project manager. Her schedule does not allow for next week between the TCC meeting and her TCSs field projects. Additionally, Dyan had also mentioned to me that she was hoping that by conducting a review earlier rather than later that everyone would be able catch things and/or correct things before reports and forms are officially submitted and filed with the various state and federal agencies. Point-in-Case, our conversations on CHFMs versus Archaeological Site Forms below.

As far as additional field visits, it sounds to me like WBI plans to be very accommodating to the THPOs that are interested in seeing specific locations. Jon at Standing Rock is working for a second field visit next week. If everyone that has an interest is able to agree upon a day, time, and location(s), We should be able to accommodate to the best of our abilities. For any of the THPOs wanting to see any specific areas they need to let Jill at WBI know a list of locations that they would like to see as well as a day and time to see them.

Subject: RE: BCA20-1313: THPO/TCS N. Bakken Field Details Update

Good Morning,

As you are aware, the fieldwork for the second field mobilization began on Friday. I have attached a PDF document with the update for the field efforts conducted on Friday and Saturday by the ERM archaeologists and TCSs.

As discussed below, on Friday, September 11, 2020, representatives from the USFS, BLM, SHPO, ERM, and BCA attended a field review of some of the areas where the ERM archaeologists encountered disagreements as to cultural features. Our meeting was meaningful and enlightening, as Dyan gave us all a lot to think about and opened up a group conversation for all participants to be heard. While no formal decisions were made, it certainly gave all participants a lot to think about and consider for these locations, this project, and in future.

Subject: RE: BCA20-1313: THPO/TCS N. Bakken Field Details Update

Good Morning,

For email string and recipient consistency, I am re-sending the first weekly update for the second field mobilization of WBI's North Bakken Expansion project. Attached is a PDF document with the update for the field efforts conducted on Friday, 9/11, and Saturday, 9/12, by the ERM archaeologists and TCSs.

Also, as a part of the updating efforts and uniformity in information distribution, on Friday, September 11, 2020, representatives from the USFS, BLM, SHPO, ERM, BCA, and the Fort Peck THPO attended a field review of some of the areas where the ERM archaeologists encountered disagreements as to cultural features. Our meeting was meaningful and enlightening, as Dyan from the Fort Peck THPO gave us all a lot to think about and opened up a group conversation for all participants to be heard. While no formal decisions were made, it certainly gave all participants a lot to think about and consider for these locations, this project, and in future.

Subject: RE: BCA20-1313: THPO/TCS N. Bakken Field Details Update

Good Afternoon,

I have received confirmation from Jill at WBI that we are to be meeting with Jon from SRST and Ben from RST this coming **Thursday (9/17) at 10:00 AM Central/9:00 AM Mountain**. We will plan to meet at the same location and review the same areas as we did last week. We will also plan to review the same locations that we did last week. These areas are all on USFS surface and in close proximity to each other. The locales to be reviewed are discussed in the weekly update emails and communications as: CHF 7, CHF 9, CHF 11, CHF 17, and CHF 18. For your schedule planning, you can assume that the review will take a few hours.

Also, to note is that as of this morning, I have had correspondence with the USFS archaeologist for the area (Andrea) that has indicated that she will be out of the office and, as such unavailable to attend. I am not sure if the USFS will be able to send anyone else in her absence, and I am not sure if any of the other agency representatives can be in attendance. Please note that I just alerted the agencies to this event. As I believe that they are to be a part of the TCC meeting that will be continuing on Thursday morning, I am not sure they would be able to make it.

Again, we will be meeting at the Tobacco Garden Bay Resort & Marina Recreational Area. We can caravan from there. The meeting point is located at:

Tobacco Gardens Resort & Marina.
4781 ND-1806
Watford City, ND 58854

At your earliest convenience, please let me know if you plan to be in attendance.

Thank you,

Raina Hanley

Notes from Field Meetings

North Bakken Pipeline 2020 Tribal Coordination | MINUTES

9/11/2020 | ~11:00 am- 1:30 pm CST | Site Visit

Meeting called by: Dyan Youpee

Type of meeting: Site Visitation and Discussion

Facilitator: Jill Linn

Attendees:

1. *Beaver Creek Archaeology (BCA)*
   a. Wade Burns
   b. Raina Hanley
   c. Larry Pallozzi
2. *WBI Energy, Inc.*
   a. Jill Linn
3. *United States Forest Service*
   a. Andrea Kruse
   b. Lucas Graf
4. *North Dakota State Historic Preservation Office*
   a. Andrew Clark
   b. Fern Swenson
5. *Bureau of Land Management*
   a. Katherine West
6. *Environmental Resources Management (ERM)*
   a. Jayson Zoino
7. *Fort Peck Tribal Historic Preservation Office*
   a. Dyan Youpee
   b. Eugene Ryan

AGENDA TOPICS

11 am – 1:30 pm CST | *Time* | Agenda topic: Field Review

Summary:

Representatives from the USFS, BLM, WBI, SHPO, ERM, BCA, and representatives from Fort. Peck attended a field review of some of the areas where the ERM archaeologists encountered disagreements as to cultural features. The meeting was meaningful and enlightening, as Dyan from Fort. Peck gave the other participants a lot to think about and opened up a group conversation for all participants to be heard. While no formal decisions were made, it certainly gave all participants a lot to think about and consider for these locations, this project, and in future.

North Bakken Pipeline 2020 Tribal Coordination | MINUTES

9/17/2020 | ~10:00 am- 1:00 pm CST | Site Visit

Meeting called by	Jon Eagle Sr.
Type of meeting	Site Visitation and Discussion
Facilitator	Jill Linn

Attendees:

1. *Beaver Creek Archaeology (BCA)*
   a. Wade Burns
   b. Raina Hanley
   c. Larry Pollazzi
2. *Bureau of Land Management*
   a. Katherine West
3. *Environmental Resources Management (ERM)*
   a. Jayson Zoino
4. *Standing Rock Sioux Tribe Tribal Historic Preservation Office*
   a. Jon Eagle Sr.
5. *Rosebud Sioux Tribe Tribal Historic Preservation Office*
   a. Ben Rhodd
6. *WBI Energy, Inc.*
   a. Jill Linn

AGENDA TOPICS

~10:00 am – 1:00 pm CST | *Time* | Agenda topic: Field Review

Summary:

Representatives from the BLM, WBI, ERM, BCA, and representatives from Standing Rock and Rosebud attended a field review of some of the areas where the ERM archaeologists encountered disagreements as to cultural features. It was determined that one of the CHF boundaries will be expanded after discussion. The meeting was meaningful and enlightening, as both Jon from SRST and Ben from RST gave the other participants a lot to think about. Their perspective(s) gave all of the participants a lot to think about and consider for these locations, this project, and in the future.

Correspondence Log with Agencies

Communications with All Agencies

Date	Summary of Communications
7/23/2020	
BLM, SHPO, USACE, USFS	At 12:25 pm CST, Raina emailed all project-specific applicable THPOs, cc'ing all involved state and federal agencies (excluding FERC). The email had the sixth weekly update for the project. Included in the email were some special notes regarding the planned end date for the project as well as providing updates with respect to the Hartel property and BCA20-1313-CHFMSite15.
9/10/2020	
BLM, SHPO, USFS, WBI *on behalf of FERC*	At 10:06 am CST, Raina emailed Liv, Beth, Troy, Andrea, Andy, and Katie, cc'ing Wade and Jill. Raina apologized for the last minute notice then gave them the run down of the site visit happening the next day.
USFS	At 10:24 am CST, Andrea emailed Raina letting her know that she plans on attending the site visit for sites on USFS land.
	At 10:25 am CST, Raina emailed Andrea and asked whether Troy will be attending.
BLM	At 10:28 am CST, Katie emailed Raina letting her know that she will be in attendance.
USFS	At 10:30 am CST, Andrea emailed Raina and said that Troy will not be attending at that time.
BLM, SHPO, USFS, WBI *on behalf of FERC*	At 12:35 pm CST, Andy emailed Liv, Beth, Troy, Andrea, Katie, cc'ing Wade and Jill. He asked if Raina can provide the site numbers for the site visit on September 11.
	At 12:57 pm CST, Raina emailed Liv, Beth, Troy, Andrea, Andy, and Katie, cc'ing Wade and Jill. Raina let them know that there is currently no site numbers as the site forms had not been submitted.
	At 1:06 pm CST, Andy emailed Liv, Beth, Troy, Andrea, Katie, cc'ing Wade and Jill and Fern. Andy asked for descriptions and location information for the sites and clarification on the nature of the disagreements between TCSs and ERM Archaeologists.
	At 1:11 pm CST, Raina emailed Liv, Beth, Troy, Andrea, Andy, and Katie, cc'ing Wade, Fern and Jill. She let them know that she followed up the earlier message with additional information regarding the sites in question. She also explained the nature of disagreements between TCSs and ERM Archaeologists as well as the main purpose of the site visit.
	At 1:16 pm CST, Raina emailed Liv, Beth, Troy, Andrea, Andy, and Katie, cc'ing Wade, Fern and Jill. Attached to the email was a general locations map for the sites. She explained that there will be information packets available for the site visit. She also reiterated the reason and purpose of he site visit.
	At 1:39 pm CST, Andy emailed Liv, Beth, Troy, Andrea, Katie, cc'ing Wade and Jill and Fern. Andy voiced a question for discussion regarding the types of forms that could be submitted.
	At 1:43 pm CST, Raina emailed Liv, Beth, Troy, Andrea, Andy, and Katie, cc'ing Wade, Fern and Jill. Raina explained why the areas were to be documented as they were.
	At 2:05 pm CST, Raina emailed Liv, Beth, Troy, Andrea, Andy, and Katie, cc'ing Wade, Fern and Jill. Raina explained why the areas were to be documented as they were and that it still may not relieve the concerns of the tribes.

9/10/2020	
BLM, SHPO, USFS, WBI *on behalf of FERC*	At 6:08 pm CST, Raina emailed Liv, Beth, Troy, Andrea, Andy, and Katie, cc'ing Wade, Fern and Jill. Raina provided an update that SRST and some other THPOs will not be able to participate in the site visit and the reasons why the site visit will continue.
9/14/2020	
BLM, SHPO, USFS, WBI *on behalf of FERC*	At 11:16 am CST, Raina emailed Liv, Beth, Troy, Andrea, Andy and Katie, cc'ing Wade, Fern and Jill. She provided a snippet from an email that was sent to the THPOs regarding the results for the September 11 site visit.
9/15/2020	
BLM, SHPO, USFS, WBI *on behalf of FERC*	At 11:34 am CST, Raina emailed Liv, Beth, Troy, Andrea, Andy and Katie, cc'ing Wade, Fern and Jill. She provided confirmation from Jill that there will be a second site visit including Jon of SRST and Ben from RST and provided the meeting details for it.
BLM	At 4:54 pm CST, Katie emailed Raina letting her know that she will be in attendance.
9/18/2020	
BLM, SHPO, USFS, WBI *on behalf of FERC*	At 8:56 am CST, Raina emailed Andy, Liv, Beth, Troy, Andrea, and Katie, cc'ing Wade, Fern and Jill. She said that she would suggest reaching out to ERM for the answer to his question.
	At 9:49 am CST, Raina emailed Liv, Beth, Troy, Andrea, Andy and Katie, cc'ing Wade, Fern and Jill. She provided an update regarding the site visit from the day before.
	At 9:52 am CST, Andy emailed Raina, Liv, Beth, Troy, Andrea, Katie, cc'ing Wade and Jill. He asked if anyone had contacted Dawn from FERC regarding the meetings.
	At 9:56 am CST, Raina emailed Andy, Liv, Beth, Troy, Andrea, and Katie, cc'ing Wade, Jill and Fern. She let them know that she is unsure if Dawn had been contacted and suggested reaching out to ERM on the subject.
	At 9:57 am CST, Raina emailed Andy, Liv, Beth, Troy, Andrea, and Katie, cc'ing Wade, Jill and Fern. Raina addressed Jill suggesting that she might be able to help him on his question regarding FERC.
	At 9:58 am CST, Jill emailed Raina, Andy, Liv, Beth, Troy, Andrea, and Katie, cc'ing Wade and Fern. She informed them that Dawn was made aware of them verbally and that an update is on the docket for a meeting that will include minutes from the meetings.
	At 10:08 am CST, Beth emailed Raina, Andy, Liv, Troy, Andrea, and Katie, cc'ing Wade, Jill and Fern. In her email, Beth stated that that while the issues are of importance to all associated agencies and tribes, the areas in question are on USFS land and are therefore under the purview of the USFS. As such discussions regarding documentation need to be through USFS. She continued by saying that she would like a call from the ERM archaeologist that had documented the areas in question to discuss them. Beth provided her phone number saying that is is best to text her first to make sure she isn't in a meeting.
	At 10:11 am CST, Raina emailed Beth, Andy, Liv, Troy, Andrea, and Katie, cc'ing Wade, Jill and Fern. She addressed Beth saying tht ERM will have to talk to her about their findings. As far as BCA is concerned the areas in question will be documented as CHFs. She closed the email by extending the invitation for a phone disussion.

9/18/2020	
BLM, SHPO, USFS, WBI *on behalf of FERC*	At 10:25 am CST, Beth emailed Raina, Andy, Liv, Troy, Andrea and Katie, cc'ing Wade, Jill and Fern. Beth addressed Raina says that she understood how BCA was documenting the areas in question. She then stated that as the agency legally responsible for the property management any final disposition of documentation needs to be discussed with USFS. She closed with reiterating that she would like a call from the ERM archaeologist working to document the areas.
	At 10:31 am CST, Raina emailed Beth, Andy, Liv, Troy, Andrea, and Katie, cc'ing Wade, Jill and Fern. She acknowledged her last email and said that she will let ERM now to give her a call.
	At ~11:00 am CST, Wade called Beth to discuss the process of documentation.
	At 11:06 am CST, Wade emailed Beth,cc'ing Raina, Andy, Liv, Troy, Andrea, Katie, Jill and Fern. He addressed Beth saying that BCA is in charge of the CHF forms while ERM is in charge of the archaeological forms. He had intended to go over he boundary change on the CHF forms with Andrea when she returned from vacation. He explained that there should be no change in the archaeological form's boundary as SHPO only wanted tribal features documented on CHF forms and not the archaeological forms. He stated that he tried to call her and asked her to give him a call.

Importance: High

CAUTION: This email originated from an outside source. Do not click links or open attachments unless you know they are safe.

Good Morning,

I apologize for the last-minute notice; however, later yesterday afternoon we were able to coordinate a requested CHFM site visit with at least two of the THPOs participating in the subject line project. Kevin at ERM may have already reached out to you about this. We plan to review three sites that archaeologists and TCSs disagreed upon located north of Watford City on USFS surface. If interest remains and time and access allow, then we will also plan to visit two similar sites on Private surface located north of Tioga. The sites being reviewed were specifically requested to be reviewed by the Ft. Peck THPO.

The meeting location information is as follows:

Tomorrow, Friday, September 11, 2020, at 11 AM Central/10 AM Mountain at the Tobacco Garden Bay Resort & Marina Recreational Area. We can caravan from there. The meeting point is located at:

Tobacco Gardens Resort & Marina.

Could you provide descriptions and location of each site early this afternoon? I would like have some information prior to field visits.

I'm a little confused. Since we are visiting cultural heritage sites, what is the nature of the disagreement? Was ERM disagreeing with the recordation of these?

Andy

Subject: RE: upcoming BCA20-1313: CHFM Site Visit(s) for WBI's N. Bakken Pipeline

I followed up the email I sent out below with some additional information that should be able to get you on the right path for the field visit.

The majority of the locations we will be reviewing are because the TCSs did not agree with the features recorded by ERM. As Dyan emailed you and Jill about, she has some concerns about what is being documented as features and subsequently archaeological sites by ERM and what sort of precedent that will be setting. There should be some details on that in some of the weekly updates you would have received.

The main purpose of the visit is for Dyan and any of the other interested THPOs to personally review the areas in disagreement to determine for themselves if they would agree with the participating TCSs or the ERM archaeologists. From there I presume they would have the necessary conversations of their thoughts with the appropriate agency individuals.

Hope this helps and I take it you plan to be in attendance tomorrow.

CAUTION: This email originated from an outside source. Do not click links or open attachments unless you know they are safe.

General Location maps attached. As I stated in one of my follow-up emails, that is not shown in the string of emails below:

"Per Dyan's request, we will be looking at CHFM 7, CHFM 9, CHFM 11, and if interest, time, and access allow CHFM 26 and CHFM 27.
Information provided thus far regarding those specific CHFMs to the THPOs, WBI, and ERM is detailed below. The Parcel numbers are detailed, if they were provided to us. It looks like the parcels coincide with TRS information. Accordingly, that should be helpful as far as location information.

We will have information packets prepared for distribution to all attendees of tomorrow's meeting.

BCA20-1313-CHFMSite7 **One cairn** [redacted] **None of the TCSs agreed it was a CHF**

BCA20-1313-CHFMSite9 **One crescent** [redacted] **ERM identified 6 stone circles that the TCSs said were not cultural; however, one of the TCSs found one feature (a crescent) that was identified as a CHF during the second site visit**

BCA20-1313-CHFMSite11 **Five cairns and three stone circles** [redacted] **None of the TCSs agreed it was a CHF**

BCA20-1313-CHFMSite26 **One stone circle** [redacted] **None of the TCSs agreed it was a CHF**
BCA20-1313-CHFMSite27 **One stone circle** **None of the TCSs agreed it was a CHF**
"

Also, to reiterate my email below: "The majority of the locations we will be reviewing are because the TCSs did not agree with the features recorded by ERM. As Dyan emailed you and Jill about, she has some concerns about what is being documented as features and subsequently archaeological sites by ERM and what sort of precedent that will be setting. Thanks for the info Raina.

I do have a question that we can discuss tomorrow. If none of the TCSs thought that a few were not cultural heritage sites, why were they recorded that way? If ERM felt they were archaeological, they should be recorded on an archaeological site form. If the TCSs didn't agree that they were sites, they should not have a corresponding Cultural Heritage Form. ERM has stated that it was their intent to put the TCS disagreement in the archaeological site form.

They are being recorded as a CHFM to document the tribal interpretation that they are not cultural sites at all and the fact that the participating TCSs had issues with ERM documenting them as archaeological sites.

Thanks.

Also, in regards to the statement about ERM including anything pertaining to tribal opinions and perspectives regarding what they are documenting as archaeological thoughts, I was under the impression from our original conversations for this project that our role, as the firm that was coordinating the tribal involvement, that tribal opinion was not to be included in the archaeology site forms and our archaeological opinion was not to be in the cultural heritage forms.

Irrespective of the documentation protocol, I do not think that, in any way, alleviates the concerns that have been raised by the tribes about the field disagreement and subsequent documentation. I can say with certainty in all my years working here, this situation has never been encountered, and as such, no protocol ever developed.

I am sure once we all get together tomorrow, we can discuss all of our opinions and concerns and come to a common understanding and agreement as to the best way to move forward with documenting the areas in question.

UPDATE:

Standing Rock and some of the other THPOs will not be able to make tomorrow's field review. Some are proposing an alternative day and time later next week.

We are continuing with tomorrow's review for multiple reasons. One is because WBI/ERM is trying to coordinate a call with the FERC project manager so that the tribes can talk to the FERC project manager. As I understand it, Dyan at Ft. Peck wanted to see some of the sites around/before the time that ERM submits their report of the work completed thus far to the FERC (they will be submitting the report to FERC tomorrow). Dyan also wanted make sure she saw some of the areas in question before any call is had between the tribes and the FERC project manager. Her schedule does not allow for next week between the TCC meeting and her TCSs field projects. Additionally, Dyan had also mentioned to me that she was hoping that by conducting a review earlier rather than later that everyone would be able catch things and/or correct things before reports and forms are officially submitted and filed with the various state and federal agencies. Point-in-Case, our conversations on CHFMs versus Archaeological Site Forms below.

As far as additional field visits, it sounds to me like WBI plans to be very accommodating to the THPOs that are interested in seeing specific locations. Jon at Standing Rock is working for a second field visit next week. If everyone that has an interest is able to agree upon a day, time, and location(s), I think we will all be willing and able to accommodate to the best of our abilities. Unfortunately, Wade would not be available next week.

For any of the THPOs wanting to see any specific areas they need to let Jill at WBI know a list of locations that they would like to see as well as a day and time to see them. I have also reminded the THPOs for sites located on public lands such as USFS and BLM managed surfaces you are always welcome to go at your convenience and leisure.

Below is the update that was sent out to the THPOs regarding our meeting on Friday.

As discussed below, on Friday, September 11, 2020, representatives from the USFS, BLM, SHPO, ERM, and BCA attended a field review of some of the areas where the ERM archaeologists encountered disagreements as to cultural features. Our meeting was meaningful and enlightening, as Dyan gave us all a lot to think about and opened up a group conversation for all participants to be heard. While no formal decisions were made, it certainly gave all participants a lot to think about and consider for these locations, this project, and in future.

Good Morning,

I have received confirmation from Jill at WBI that we will be meeting with Jon from SRST and Ben from RST this coming Thursday (9/17) at 10:00 AM Central/9:00 AM Mountain.
We will plan to meet at the same location and review the same areas as we did last week, on USFS surface. I have had correspondence with Andrea today that has indicated that she will be out of the office and as such unavailable to attend.

Again, we will be meeting at the Tobacco Garden Bay Resort & Marina Recreational Area. We can caravan from there. The meeting point is located at:

Tobacco Gardens Resort & Marina.
4781 ND-1806
Watford City, ND 58854

At your earliest convenience, please let me know if you will be able to be in attendance.

Thank you,

Raina Hanley

Good Morning,

Your agency update for yesterday's meeting is below. It is the same update I sent out to the THPOs.

As you may be aware, yesterday Thursday, September 17, 2020, representatives from the BLM, ERM, BCA, and the Standing Rock and Rosebud THPOs attended a field review of some of the areas where the ERM archaeologists encountered disagreements as to cultural features. Our meeting was meaningful and enlightening, as both Jon from SRST and Ben from RST gave us all a lot to think about. Their perspective(s) gave all of the participants a lot to think about and consider for these locations, this project, and in future.

Have a nice day.

All:

While the issues covered are of importance to all of the associated agencies and Tribes, the sites in question are all on FS/Grasslands managed properties and therefore under the purview of this office. As such, the discussion of how we will be moving forward concerning the documentation types, etc. need to be with this office. FERC should be kept up to date through the contractor and any questions or concerns can be addressed to this office.

My understanding of the two site visits is that the discussions resulted in a more definitive – all though differing – view from all of the Tribes than was presented earlier in this email chain.

I would like a call from the archaeologist documenting these areas to discuss how those sites on FS/Grasslands managed properties will be documented as based on the archaeologists findings and the extremely important Tribal information provided during those meetings (as well as our on-going consultation).

I am available by phone: 775-389-0125. It is best to text first to make sure that I'm not in a meeting.

Hi Beth,

ERM will have to talk to you about their archaeological findings. They do have their site forms on file at SHPO so their take on the locales should be ready for your review unless you are looking for more information.

As far as our firm being involved with the tribal coordination, it sounds like the areas in question will be being documented as CHFs.

If you would like to schedule a call to further discuss, we can.

On Sep 18, 2020, at 10:25 AM, Bigelow, Elizabeth E -FS <elizabeth.e.bigelow@usda.gov> wrote:

Good morning Raina,

Yes, I understand that the sites are already documented and with the SHPO and the sites will be documented as CHFs.

Regardless, as the agency who is responsible for the management of these properties, any final disposition of documentation – including possible updates to the existing sites form currently at the SHPO's office as based on the most recent in-field consultation – needs to be discussed with the agency who is legally responsible for the management of those properties.

I am not in the Dakotas and do not have the contact information readily available, so as stated below I would like a call from whomever is working to document the archaeological sites, the full report, whichever. I need to assure that the information we need is included in that reporting as this is not just a simple "what form do we use" issue.

Thank you,

Beth

Subject: Re: upcoming BCA20-1313: CHFM Site Visit(s) for WBI's N. Bakken Pipeline

Beth,
BCA is in charge of the CHF forms while ERM is in charge of the archaeological forms. I had intended to go over the boundary change on the CHF forms with Andrea when she returns from vacation. There should be no change in the archaeologist form for their boundary as SHPO has indicated they want tribal features only documented on CHF forms and not on the archaeologist form. I tried giving you a call to discuss how you want to proceed. Please give me a call when you have a moment and we can discuss further.
Thanks,
Wade
